LEUCIPPUS, a celebrated Greek philosopher and mathematician; first author of the famous system of atoms and vacuums, and of the hypothesis of storms; since attributed to the moderns. He flourished about 428 B. C.

LEUCOGÆUS, (anc. geog.), a hill situated between Puteoli and Neapolis in Campania, abounding in sulphur; now *Palumera*. Whence there were also springs called *Leucogæi fontes*, the waters of which, according to Pliny, gave a firmness to the teeth, clearness to the eyes, and proved a cure in wounds.

LEUCOJUM, GREAT SNOW-DROP; a genus of the monogynia order, belonging to the hexandria class of plants.

*Species.* 1. The vernum, vernal, or spring leucojum, hath an oblong bulbous root, sending up several flat leaves six or eight inches long; and amidst them an upright, channelled, hollow, naked stalk, about a foot high, terminated by a spatula, protruding one or two white flowers on slender footstalks drooping downwards, and appearing in March. 2. The æstivum, or summer leucojum, hath a large, oblong, bulbous root, crowned with several long, flat, broad leaves; and amidst them an upright, thick, hollow stalk, 15 or 18 inches high; terminated by a spatula, protruding many white flowers, on slender footstalks, drooping downwards; flowering in May. 3. The autumnale, or autumnal leucojum, hath a large oblong bulbous root, crowned with many narrow leaves, an upright, naked, hollow stalk, terminated by a spatula protruding many white flowers on long weak footstalks, hanging downwards, and flowering in autumn.

*Culture.* All the three species are very hardy, durable in root, and increase exceedingly by offsets, which may be separated every two or three years.

LEUCOMA, in surgery, a dissemmer of the eye, otherwise called *albugo*. See *ALBUGO*, and (*Index* subjoined to) *MEDICINE*.

LEUCOPHLEGMATIA, in medicine, a kind of dropsy, otherwise called *anasarca*. See (*Index* subjoined to) *MEDICINE*.

LEUCTRA, (anc. geog.), a town of Bœotia, to the west of Thebes, or lying between Platææ and Thebie, where the Lacedæmonians had a great defeat given them by Epaminondas and Pelopidas the Theban generals. The Theban army consisted at most but of 6000 men, whereas that of the enemy was at least thrice that number: but Epaminondas trusted most in his horse, wherein he had much the advantage, both in their quality and good management; the rest he endeavoured to supply by the disposition of his men, and the vigour of the attack. He even refused to suffer

any to serve under him in the engagement, but such as he knew to be fully resolved to conquer or die. He put himself at the head of the left wing, opposite to Cleombrotus king of Sparta, and placed the main fires of the battle there; rightly concluding, that, if he could break the body of the Spartans, which was but 12 men deep, whereas his own was 50, the rest would be soon put to flight. He closed his own with the sacred band, which was commanded by Pelopidas; and placed his horse in the front. His right, from which he had drawn so many men, he ordered to fall back, in a slanting line, as if they declined to fight, that they might not be too much exposed to the enemy, and might serve him for a corps of reserve in case of need. This was the wife disposition which the two Theban generals made of their few, but resolute forces; and which succeeded, in every part, according to their wish. Epaminondas advanced with his left wing, extending it obliquely, in order to draw the enemy's right from the main body; and Pelopidas charged them with such desperate speed and fury, at the head of his battalion, before they could reunite, that their horse, not being able to stand the shock, were forced back upon their infantry, which threw the whole into the greatest confusion: so that though the Spartans were of all the Greeks the most expert in recovering from any surprize, yet their skill on this occasion either failed them or proved of no effect; for the Thebans, observing the dreadful impression they had made on them with their horse, pushed furiously upon the Spartan king, and opened their way to him with a great slaughter.

Upon the death of Cleombrotus, and several officers of note, the Spartans, according to custom, renewed the fight with double vigour and fury, not so much to revenge his death as to recover his body, which was such an established point of honour as they could not give up without the greatest disgrace: but here our Theban general wisely chose rather to gratify them in that point, than to hazard the success of a second onset; and left them in possession of their king, whilst himself marched straight against their other wing, which was commanded by Archidamus, and consisted chiefly of such auxiliaries and allies as had not heartily engaged in the Spartan interest: and these were so disheartened at the death of the king, and the defeat of that wing, that they betook themselves to flight, and were presently after followed by the rest of the army. The Thebans, however, pursued them so closely, that they made a second dreadful slaughter among them; which completed Epaminondas's victory, who remained master of the field, and erected a trophy in memory of it. This was the conclusion of the famed battle of Leuctra, in which the Lacedæmonians lost 4000 men, and the Thebans but 300.

LEVEL, an instrument wherewith to draw a line parallel to the horizon, by means of which the true level, or the difference of ascent or descent between several places, may be found for conveying water, draining fens, &c.

There are several instruments of different contrivance and matter, invented for the perfection of levelling; all of which, for the practice, may be reduced to those that follow.

*Air-LEVEL*, that which shews the line of level by

MEANS

Level.

means of a bubble of air inclosed with some liquor in a glass-tube of an indeterminate length and thickness, whose two ends are hermetically sealed. When the bubble fixes itself at a certain mark, made exactly in the middle of the tube, the plane or ruler wherein it is fixed is level. When it is not level, the bubble will rise to one end. This glass-tube may be set in another of brass, having an aperture in the middle, whence the bubble of air may be observed. The liquor wherewith the tube is filled, is oil of tartar, or aqua secunda; those not being liable to freeze as common water, nor to rarefaction and condensation, as spirit of wine is. There is one of these instruments with sights, being an improvement upon that last described, which, by the addition of more apparatus, becomes more commodious and exact. It consists of an air-level, n<sup>o</sup> 1. about eight inches long, and seven or eight lines in diameter, set in a brass-tube, 2, with an aperture in the middle, C. The tubes are carried in a strong straight ruler, a foot long; at whose ends are fixed two sights, 3, 3, exactly perpendicular to the tubes, and of an equal height, having a square hole, formed by two fillets of brass crossing each other at right angles, in the middle whereof is drilled a very little hole, through which a point on a level with the instrument is described. The brass-tube is fastened on the ruler by means of two screws; one whereof, marked 4, serves to raise or depress the tube at pleasure, for bringing it towards a level. The top of the ball and socket is rivetted to a little ruler that springs, one end whereof is fastened with screws to the great ruler, and at the other end has a screw, 5, serving to raise and depress the instrument when nearly level.

This instrument, however, is yet less commodious than the following one; because though the holes be ever so small, yet they will still take in too great a space to determine the point of level precisely.

This instrument consists of an air-level, with telescope sights. This level (*ibid.* n<sup>o</sup> 2.) is like the last; with this difference, that, instead of plain sights, it carries a telescope to determine exactly a point of level at a good distance. The telescope is a little brass-tube, about 15 inches long, fastened on the same ruler as the level. At the end of the tube of the telescope, marked 1, enters the little tube 1, carrying the eye-glass and an hair horizontally placed in the focus of the object-glass, 2; which little tube may be drawn out, or pushed into the great one, for adjusting the telescope to different sights: at the other end of the telescope is placed the object-glass. The screw 3, is for raising or lowering the little fork, for carrying the hair, and making it agree with the bubble of air when the instrument is level; and the screw 4, is for making the bubble of air, D or E, agree with the telescope: the whole is fitted to a ball and socket. M. Huygens is said to be the first inventor of this level; which has this advantage, that it may be inverted by turning the ruler and telescope half round; and if then the hair cut the same point that it did before, the operation is just.

It may be observed, that one may add a telescope to any kind of level, by applying it upon, or parallel to, the base or ruler, when there is occasion to take the level of remote objects.

Dr Defaguliers contrived an instrument, by which the difference of level of two places, which could not

be taken in less than four or five days with the best telescope-levels, may be taken in as few hours. The instrument is as follows. To the ball C (*ibid.* n<sup>o</sup> 3.) is joined a recurve tube BA, with a very fine bore, and a small bubble at top, A, whose upper-part is open. It is evident from the make of this instrument, that if it be inclined in carrying, no prejudice will be done to the liquor, which will always be right both in the ball and tube when the instrument is set upright. If the air at C be so expanded with heat, as to drive the liquor to the top of the tube, the cavity A will receive the liquor, which will come down again and settle at D, or near it, according to the level of the place where the instrument is, as soon as the air at C returns to the same temperament as to heat and cold. To preserve the same degree of heat, when the different observations are made, the machine is fixed in a tin vessel EF, filled with water up to *g h*, above the ball, and a very sensible thermometer has also its ball under water, that one may observe the liquor at D, in each experiment, when the thermometer stands at the same height as before. The water is poured out when the instrument is carried; which one may do conveniently by means of the wooden frame, which is set upright by the three screws S, S, S, *ibid.* n<sup>o</sup> 4. and a line and plummet P P, n<sup>o</sup> 5. At the back part of the wooden frame, from the piece at top K, hangs the plummet P, over a brass point at N; *M m* are brackets to make the upright board K N continue at right angles with the horizontal one at N. N<sup>o</sup> 6. represents a front view of the machine, supposing the fore part of the tin-vessel transparent; and here the brass-socket of the recurve-tube, into which the ball is screwed, has two wings at I I, fixed to the bottom, that the ball may not break the tube by its endeavour to emerge when the water is poured in as high as *g h*.

After the Doctor had contrived this machine, he considered, that as the tube is of a very small bore, if the liquor should rise into the ball at A, n<sup>o</sup> 3. in carrying the instrument from one place to another, some of it would adhere to the sides or the ball A, and upon its descent in making the experiment, so much might be left behind, that the liquor would not be high enough at D to shew the difference of the level: therefore, to prevent that inconvenience, he contrived a blank screw, to shut up the hole at A, as soon as one experiment is made, that, in carrying the machine, the air in A may balance that in C, so that the liquor shall not run up and down the tube, whatever degree of heat and cold may act upon the instrument, in going from one place to another. Now, because one experiment may be made in the morning, the water may be so cold, that when a second experiment is made at noon the water cannot be brought to the same degree of cold it had in the morning; therefore, in making the first experiment, warm water must be mixed with the cold, and when the water has stood some time before it comes to be as cold as it is likely to be at the warmest part of that day, observe and set down the degree of the thermometer at which the spirit stands, and likewise the degree of the water in the barometer at D; then screw on the cap at A, pour out the water, and carry the instrument to the place whose level you would know; then pour in your water, and when the thermometer is come to the same degree as before, open

Level.

Plate  
CLXII.  
fig. 1.

Level. open the screw at top, and observe the liquor in the barometer.

The Doctor's scale for the barometer is ten inches long, and divided into tenths; so that such an instrument will serve for any heights not exceeding ten feet, each tenth of an inch answering to a foot in height.

The Doctor made no allowance for the decrease of density in the air, because he did not propose this machine for measuring mountains, (tho', with a proper allowance for the decreasing density of the air, it will do very well), but for heights that want to be known in gardens, plantations, and the conveyance of water, where an experiment that answers two or three feet in a distance of 20 miles, will render this a very useful instrument.

*Artillery Foot-Level* is in form of a square, having its two legs or branches of an equal length; at a juncture whereof is a little hole, whence hangs a thread and plummet playing on a perpendicular line in the middle of a quadrant. It is divided into twice 45 degrees from the middle, *ibid.* n° 7.

This instrument may be used on other occasions, by placing the ends of its two branches on a plane; for when the thread plays perpendicularly over the middle division of the quadrant, that plane is assuredly level. To use it in gunnery, place the two ends on the piece of artillery, which you may raise to any proposed height, by means of the plummet, whose thread will give the degree above the level.

*Carpenter's and Paviour's LEVEL*, consists of a long ruler, in the middle whereof is fitted, at right angles, another somewhat bigger, at the top of which is fastened a line, which, when it hangs over a fiducial line at right angles with the base, shews that the said base is horizontal. Sometimes this level is all of one board. *Ibid.* n° 8.

*Gunnery LEVEL*, for levelling cannons and mortars, consists of a triangular brass plate, about four inches high, *ibid.* 9. at the bottom of which is a portion of a circle, divided into 45 degrees; which number is sufficient for the highest elevation of cannons and mortars, and for giving shot the greatest range: on the centre of this segment of a circle is screwed a piece of brass, by means of which it may be fixed or screwed at pleasure: the end of this piece of brass is made so as to serve for a plummet and index, in order to shew the different degrees of elevation of pieces of artillery. This instrument has also a brass foot, to set upon cannons or mortars, so as, when those pieces are horizontal, the instrument will be perpendicular. The foot of this instrument is to be placed on the piece to be elevated, in such a manner, as that the point of the plummet may fall on the proper degree: this is what they call *levelling the piece*.

*Mason's LEVEL*, is composed of three rules, so joined as to form an isosceles-rectangle, somewhat like a roman A; at the vertex whereof is fastened a thread, from which hangs a plummet, that passes over a fiducial line, marked in the middle of the base, when the thing to which the level is applied is horizontal; but declines from the mark, when the thing is lower on the one side than on the other.

*Plumb or Pendulum LEVEL*, that which shews the horizontal lines by means of another line perpendicular to that described by a plummet or pendulum. This

instrument, *ibid.* n° 10. consists of two legs or branches, joined together at right angles, whereof that which carries the thread and plummet is about a foot and a half long; the thread is hung towards the top of the branch, at the point 2. The middle of the branch where the thread passes is hollow, so that it may hang free every where: but towards the bottom, where there is a little blade of silver, whereon is drawn a line perpendicular to the telescope, the said cavity is covered by two pieces of brass, making as it were a kind of case, lest the wind should agitate the thread; for which reason the silver blade is covered with a glass G, to the end that it may be seen when the thread and plummet play upon the perpendicular: the telescope is fastened to the other branch of the instrument, and is about two feet long; having an hair placed horizontally across the focus of the object-glass, which determines the point of the level. The telescope must be fitted at right angles to the perpendicular. It has a ball and socket, by which it is fastened to the foot, and was invented by M. Picard.

*Reflecting LEVEL*, that made by means of a pretty long surface of water representing the same object inverted which we see erected by the eye, so that the point where these two objects appear to meet is a level with the place where the surface of the water is found. This is the invention of M. Marriotte.

There is another reflecting level consisting of a mirror of steel, or the like, well polished, and placed a little before the object-glass of a telescope, suspended perpendicularly. This mirror must make an angle of 45° with the telescope, in which case the perpendicular line of the said telescope is converted into a horizontal line, which is the same with the line of level. This is the invention of M. Cassini.

*Water-LEVEL*, that which shews the horizontal line by means of a surface of water or other liquor; founded on this principle, that water always places itself level.

The most simple is made of a long wooden trough, or canal, whose sides are parallel to the base; so that being equally filled with water, its surface shews the line of level. This is the chorobates of the ancients. See CHOROBATA.

It is also made with two cups fitted to the two ends of a pipe, three or four feet long, about an inch in diameter, by means whereof the water communicates from the one to the other cup; and this pipe being moveable on its stand by means of a ball and socket, when the two cups become equally full of water, their two surfaces mark the line of level.

This instrument, instead of cups, may also be made with two short cylinders of glass three or four inches long, fastened to each extreme of the pipe with wax or mastic. Into the pipe is poured some common or coloured water, which shews itself through the cylinders, by means whereof the line of level is determined; the height of the water, with respect to the centre of the earth, being always the same in both cylinders: this level, though very simple, is yet very commodious for levelling small distances.

*LEVEL of Mr Huygens's invention*, consists of a telescope A, *ibid.* n° 11. in form of a cylinder, going through a ferril, in which it is fastened by the middle. This ferril has two flat branches b b, one above, and the

Levelling the other below: at the ends whereof are fastened little moving pieces, which carry two rings, by one of which the telescope is suspended to an hook at the end of the screw 3, and by the other a pretty heavy weight is suspended, in order to keep the telescope in *equilibrium*. This weight hangs in the box 5, which is almost filled with linseed oil, oil of walnuts, or other matter that will not easily congregate, for more aptly settling the balance of the weight and telescope. The instrument carries two telescopes close and very parallel to each other; the eye-glasses of the one being against the object-glasses of the other, that one may see each way without turning the level. In the focus of the object-glasses of each telescope must a little hair be strained horizontally, to be raised and lowered as occasion requires by a little screw. If the tube of the telescope be not found level when suspended, a ferril or ring, 4, is put on it, and is to be slid along till it fixes to a level. The hook on which the instrument is hung, is fixed to a flat wooden cross; at the ends of each arm whereof there is a hook serving to keep the telescope from too much agitation in using or carriage. To the said flat cross is applied another hollow one, that serves as a case for the instrument; but the two ends are left open, that the telescope may be secured from the weather, and always in a condition to be used. The foot of this instrument is a round brass plate, to which are fastened three brass ferrils, moveable by means of joints wherein are put slaves, and on this foot is placed the box.

N<sup>o</sup> 12. marked I, is a balance-level; which being suspended by the ring, the two sights, when in *equilibrium*, will be horizontal, or in a level.

LEVELLING, the art of finding a line parallel to the horizon at one or more stations, in order to determine the height of one place with regard to another. See the preceding article.

A truly level surface is a segment of a spherical surface, which is concentric to the globe of the earth. A true line of level is an arch of a great circle, which is imagined to be described upon a truly level surface. This apparent level is a straight line drawn tangent to an arch or line of true level. Every point of the apparent level, except the point of contact, is higher than the true level: thus let EAG (n<sup>o</sup> 1.) be an arch of a great circle drawn upon the earth; to a person who stands upon the earth at A, the line HD is the apparent level parallel to his rational horizon RR: but this line, the farther it is extended from his station A, the farther it recedes from the centre; for BC is longer than AC, and DC is longer than BC, &c. The common methods of levelling are sufficient for laying pavements of walks, for conveying water to small distances, for placing horizontal dials, or astronomical instruments: but in levelling the bottoms of canals which are to convey water to the distance of many miles, the difference between the apparent and true level must be taken into the account. Thus let IAL (*ibid.* n<sup>o</sup> 2.) be an arch of a great circle upon the earth: let it be required to cut a canal whose bottom shall be a true level from A to B, of the length of 5078 feet: the common method is to place the levelling instrument in the bottom of the canal at A; and, looking through the sights placed horizontally at a stick set up perpendicular at B, to make a mark where

the visual ray or point of the apparent level points at E, and then to sink the bottom of the canal at B as much below E as A is below D. But this will not give the true level: for, according to Cassini's calculation, at the distance of 5078 feet the apparent level is seven inches above the true; and therefore, to make a true level, B must be sunk seven inches lower than the apparent level directs; so that if A be four feet below D, B must be four feet seven inches below the mark E. We have here mentioned the error which will arise from placing the level at one end of the line to be levelled, and shewn how to correct it; but in most cases it is better to take a station in the middle of the line to be levelled: thus, if the points H and B are to be levelled, place the instrument in the middle at A, and setting up sticks perpendicular at H and B, make marks upon each stick where the apparent level points, as E and F; those points are level: and if you sink H as much below F, as B is below E, HAB will be a true level.

The operation of levelling is as follows. Suppose the height of the point A (*ibid.* n<sup>o</sup> 3.) on the top of a mountain above that of the point B, and at the foot thereof, be required. Place the level about the middle distance between the two points as in D, and staves in A and B; and let there be persons instructed with signals for raising and lowering, on the said staves, little marks of pasteboard or other matter, the level being placed horizontally by the bubble, &c. Look towards the staff AE, and cause the mark so raised to be lowered till the middle, upper edge, or other most conspicuous part, appear in the visual ray. Then measuring exactly the perpendicular height of the point E above the point A, which suppose six feet four inches; set that down in your book; then turn the level horizontally about, that the eye-glasses of the telescope may be still next the eye when you look the other way; if you have only plain sights, the instrument need not be turned; and cause the person at the staff B, to raise or lower his mark, till some conspicuous part of it fall in the visual ray, as at C: then measure the perpendicular height of C above B, which suppose sixteen feet six inches; set this also down in the book above the other number of the first observation; subtract the one from the other, and the remainder will be ten feet two inches, which is the difference of the level between A and B, or the height of the point A above the point B.

If the point D, where the instrument is fixed, be in the middle between the two points A and B, there will be no necessity for reducing the apparent level to the true level; the visual ray in that case being raised equally above the true level. If it be further required to know whether there be a sufficient descent for conveying water from the spring A (*ibid.* n<sup>o</sup> 4.) to the point B. Here, in regard the distance from A to B is considerable, it is required that several operations be made. Having then chosen a proper place for the first station, as at I, set up a staff in the point A, near the spring, with a proper mark to slide up and down the staff, as L; and measure the distance from A to I, which suppose 2000 yards. Then the level being adjusted in the point I, let the mark L be raised and lowered till such time as you spy some conspicuous part of it through the telescope or sights of the level, and measure the height AI, which suppose thirteen feet

levelling. feet five inches. But in regard the distance AI is 2000 yards, you must have recourse to your table for a reduction, subtracting 11 inches, which will leave the height of AL twelve feet six inches; and this note down in your book. Now turn the level horizontally about, so that the eye-glass of the telescope may be towards A; and, fixing up another staff at H, cause the mark G to be moved up and down till you spy some conspicuous part through the telescope or sights. Measure the height HG, which suppose seven yards one foot two inches. Measure likewise the distance of the points IH, which suppose 1300 yards; for which distance four inches eight lines must be subtracted from the height HG, which consequently will only leave seven yards nine inches four lines, to be taken down in your book. This done, remove the level forwards to some other eminence, as E, whence the staff H may be viewed; as also another staff at D, near the place whither the water is to be conveyed. The level being again adjusted in the point E, look back to the staff H; and managing the mark as before, the visual ray will give the point F. Measure the height HF, which suppose eleven feet six inches. Measure likewise the distance HE, which suppose 1000 yards, for which there is two inches nine lines of abatement; which being taken from the height HF, there will remain eleven feet three inches three lines; which enter in your book: Lastly, turning the level to look at the next staff D, the visual ray will give the point D. Measure the height of D from the ground, which suppose eight feet three inches. Measure also the distance from the station E to B, which suppose 900 yards, for which distance there are two inches three lines of abatement; which being taken from the height BD, there will remain eight feet nine lines; which enter as before.

For the manner of entering down observations in your book, observe, that when a proper place or station for the level between the two points has been pitched upon, write down the two heights observed at that station in two different columns, viz. under the first column, those observed in looking through the telescope when the eye was from the spring, or towards the point, which we may call *back-sights*; and under the second column, those observed when the eye was next the spring, which we call *fore-sights*. Having summed up the heights of each column separately, subtract the lesser from the greater, the remainder will be the difference of the level between the points A and B. If the distance of the two points be required, add all the distances measured together; and dividing the difference of height by the yards of the distances, for each 200 yards you will have a descent of about two inches nine lines.

Dr Halley suggests a new method of levelling, performed wholly by means of the barometer, in which the mercury is found to be suspended to so much the less height, as the place is farther remote from the centre of the earth; whence the different heights of the mercury in two places give the difference of level. This method has been put in practice by some of the French academy.

LEVELLING-*Staves*, instruments used in levelling, serving to carry the marks to be observed, and at the same time to measure the heights of those marks from the ground. They usually consist each of two long

wooden rulers, made to slide over one another, and divide into feet, inches, &c.

LEVER, in mechanics, is a bar of iron or wood, one part of which being supported by a prop, all other parts turn upon that prop as their centre of motion. This instrument is of two kinds. First, the common sort, where the weight we desire to raise, rests at one end of it, our strength is applied at the other end, and the prop is between both. When we stir up the fire with a poker, we make use of this lever; the poker is the lever, it rests upon one of the bars of the grate as a prop, the incumbent fire is the weight to be overcome, and the other end held in the hand is the strength or power. In this, as in all the rest, we have only to increase the distance between the strength and prop, to give the man that works the instrument greater power.

The lever of the second kind, has the prop at one end, the strength is applied to the other, and the weight to be raised rests between them. Thus in raising the water-plug in the streets, the workman puts his iron lever through the hole of the plug till he reaches the ground on the other side, and, making that his prop, lifts the plug with his strength at the other end of the lever. In this lever also, the greater the distance of the prop from the strength, the greater is the workman's power.

These instruments, as we see, assist the strength; but sometimes a workman is obliged to act at a disadvantage, in raising either a piece of timber or a ladder upon one end. We cannot, with grammatical propriety, call this a *lever*, since such a piece of timber in fact in no way contributes to raise the weight. In this case, the man, who is the strength or power, is in the middle, the part of the beam already raised is the weight, the part yet at the ground is the prop, on which the beam turns or rests. Here the man's strength will be diminished, in proportion to the weight it sustains. The weight will be greater the farther it is from the prop, therefore the man will bear the greater weight the nearer he is to the prop. See MECHANICS.

LEVERET, among sportsmen, denotes a hare in the first year of her age.

LEVIGATION, in pharmacy and chemistry, the reducing hard and ponderous bodies to an impalpable powder, by grinding them on a porphyry, or in a mill. See CHEMISTRY, n° 97.

LEWDNESS. See FORNICATION.

LEVITE, in a general sense, means all the descendants of Levi, among whom were the Jewish priests themselves, who, being descended from Aaron, were likewise of the race of Levi.—In a more particular sense, *Levite* is used for an order of officers in that church, who were employed in performing the manual service of the temple; such as in fetching wood, water, and other things necessary for the sacrifices; and in singing, and playing upon instruments of music.

The consecration of the Levites was to be performed with the following ceremonies: They were to be sprinkled with the water of expiation, to shave all their flesh, and wash their clothes: they were then to bring two bullocks before the door of the tabernacle, where the whole congregation laid their hands upon the Levites heads: the bullocks were then sacrificed, one for a burnt-offering, and the other for a sin-offering; and,

*Leviticus* lastly, they were to be presented to the high-priest, who was to consecrate them to the Lord.

*Levy.*

The Levites were subjoined by the tythe of all the corn, fruit and cattle, throughout Israel; a tythe of which tythe they were to give to the priests: they had also 48 cities for their habitation; and while they were actually employed in the service of the temple, they were subjoined out of the daily sacrifices.

LEVITICUS, a canonical book of the Old Testament, so called from its containing the laws and regulations relating to the priests, Levites, and sacrifices.

LEVITY, in physiology, the privation or want of weight in any body when compared with another that is heavier than it; in which sense it stands opposed to gravity.

LEUK, a town of Switzerland, almost in the middle of the Valais; remarkable for its natural strength, for the assembly of the states that often meet there, and for its baths, whose water is so hot that they will boil eggs.

LEUSDEN (John), a celebrated philologist, born in 1624. He studied the learned languages and mathematics at Utrecht; and then went to Amsterdam, to converse with the rabbis, and perfect himself in the Hebrew tongue. After which he was professor of Hebrew at Utrecht, where he acquired a great reputation, and died in 1699. He wrote many valuable works; the principal of which are, 1. *Onomasticum Sacrum*, 8vo. 2. *Clavis Hebraica & Philologica Veteris Testamenti*, 4to. 3. *Novi T. Clavis Græca, cum Annotationibus Philologicis*, 8vo. 4. *Compendium Biblicum Veteris Testamenti*, 8vo. 5. *Compendium Græcum Novi Testamenti*, the best edition of which is that of London, in 1688, 12mo. 6. *Philologus Hebraeus*, 4to. 7. *Philologus Hebræo-Græcus*, 4to. 8. *Philologus Hebræo-Græcus*, 4to. 9. Notes on Jonas, Joel, Hosea, &c. He also gave correct editions of several learned works.

LEUTKIRK, a free and imperial town of Germany, in Suabia, and in Algow, seated on a rivulet that falls into the Illar, in E. Long. 10. 10. N. Lat. 47. 53.

LEUTMERITZ, a town of Bohemia, capital of a circle of the same name, with a bishop's see, seated on the river Elbe, in E. Long. 14. 25. N. Lat. 50. 34.

LEWARDEN, a handsome, rich, and strong town of the United Provinces, capital of Oostergow, Westergow, Sevenwolden, and West Friesland. It was the usual place of residence of the Stadtholder; and in buildings, as well public as private, is very magnificent. It has several canals running through the streets, which are of great service to their trade, especially as they are continued to the sea and to the most considerable towns of the province. E. Long. 5. 42. N. Lat. 53. 12.

LEUWENHOEK (Anthony de), a celebrated Dutch physician and naturalist, was born at Delft, in 1632, of an ancient family of that city; and acquired a very great reputation throughout all Europe, by his experiments and discoveries. He particularly excelled in making glasses for microscopes and spectacles, and died in 1723. His letters to the royal society of London, of which he was a member, were printed at Leyden, in 1722, in 4to.

LEVY, in law, signifies to gather or collect; as to

levy money, and to levy a fine of lands in the passing *Lewentz* a fine.

LEWENTZ, a town of Upper Hungary, in the county of Gran, and on the river of the same name, where the Turks were defeated in 1644. E. Long. 18. 19. N. Lat. 48. 15.

LEWES, a town of Suffex in England, seated on an eminence on the banks of the river Ouse. It is a large well built place, hath two streets paved, and six parish-churches built with flint-stone. It contains about 1500 houses, and upwards of 6000 inhabitants. E. Long. 0. 5. N. Lat. 50. 50.

LEWIS, one of the largest of the Hebrides or western islands of Scotland, extending 100 miles in length from north to south, and from 13 to 14 in breadth, consisting of a great number of isles and rocks, and parted by the sea into two divisions, called *Lewis* and *Harries*, the former lying to the westward of the other. Lewis belongs to the shire of Ross; is divided by several channels, distinguished by several names, and portioned out among different proprietors; but the *Lewis*, strictly so called, stretches about 36 miles in length, from the north point of Bowling-head to the southern extremity of Haffness in Harries. The air is temperately cold, moist, and healthy; great parts of the low ground is flooded with lakes; the rest is arable in many places, and has been counted fruitful in oats, barley, rye, flax, and hemp. The soil in these parts is a light sand, which the inhabitants manure with foot and sea-ware; but great part of the island is covered with heath. The labouring people dig the land with spades, and break the clods with small harrows, the foremost teeth of which are made of wood, and the remainder of rough heath, which smooths what the others have broke; and this harrow is drawn by one man, having a strong trace of horse-hair across his breast. Of their corn they not only make malt for ale, but likewise a strong spirit called *treffareg*, which is the whisky, or usquebaugh, three times distilled.

Lewis abounds with convenient bays and harbours, namely, Lochthornvay, on the east side; the Birken isles, about seven miles farther southward; Loch-crefort, three miles more to the south; Loch-seafort, about five miles still farther in the same direction; Loch-carlavy, a capacious and secure harbour, about 24 miles to the south-west; and Loch-rague, four miles more southerly on the same coast; all these bays abound with cod, ling, and herring: here are likewise whales of different sizes, which the natives drive into the bays, and kill with harpoons. Fifty young whales have been killed on this coast in one season; and their flesh was eaten by the natives, who count it salutary and toothsome, distinguishing it by the name of *seapork*. These bays afford great plenty of shell-fish; such as clams, oysters, cockles, mussels, limpets, welks; and such a prodigious quantity of spout-fish is sometimes cast up from the sand off Loch-tua, that they infect the air, and render it unhealthy to the neighbouring inhabitants, who are not able to consume them, either by eating, or using them as manure for the ground. Some of these lochs and bays likewise produce small coral and coralline. The fresh-water lakes are well stored with trout and eels, and the rivers yield plenty of salmon. Along the coast are found a great number of caves, which serve as shelter for the seals

*Lewis.*

*Smollet's Present State of all Nations.*

seals and otters, which are also eaten as dainties by the inhabitants; and vast numbers of sea-fowl build upon the rocks and promontories.

The land-animals reared in this island, are cows, horses, sheep, goats, hogs, and deer; all these are of a diminutive size. The beef, mutton, and pork, are juicy and delicious; the horses are active and hardy; the deer, which are of the red kind, confine themselves to the chase of Oseval, about 15 miles in compass, which affords tolerable pasturage; but in the winter, when the ground is covered with frost and snow, these animals are forced to feed on sea-ware, and endure all the rigour of the season, without any shelter from wood or copse, for there is not a tree to be seen; nevertheless, the roots of very large trees, which have been cut by the ax, are found in different places. There is likewise a small grove of birch and hazel on the south-west side of Loch-Stornaway.

The inhabitants of Lewis are in general well-proportioned, tall, fair, sanguine, strong, and healthy. The small-pox sometimes makes terrible havoc among them. The other diseases to which they are subject, are the chin-cough in children, the fever, the diarrhoea, dysentery, fore-throats, jaundice, stitches, pleuritis, coughs, and rheums. As a medicine for the diarrhoea and dysentery, they administer the kernel of the black Molucca beans, powdered and drank in boiled milk; and sometimes the patient swallows a small dose of their strong whisky diluted with water. This is likewise prescribed to children in the small-pox, when the pulse sinks and the pustules do not fill. Inflammatory disorders they cure by repeated bleeding; coughs and colds are removed by drinking plentifully of warm brochan, or water-gruel, with butter or honey, taken at bed-time; which not only acts as a balsamic pectoral, but wonderfully promotes the discharge of sweat and urine. When the ovula are enlarged, they snip off part of it with a pair of scissors; for the jaundice, they sluice a pail-full of cold water by surprise on the patient's naked back, or fear the vertebrae with an actual cautery when he dreams of no such application. Green wounds they cure with ointments made of vulnerary plants and fresh-butter.

The natives of Lewis are quick of apprehension; ingenious in mechanics; and much addicted to poetry and music, many of them learning to play on the bagpipe and violin. They are in general sober, circumspect, and hospitable; dexterous in shooting, swimming, leaping; bold and skillful mariners; and so temperate, that they will tug at the oar all day, without any other provision than bread and water, with a fush of tobacco.

Along this coast we see several natural mounts or forts, called *Dun*, such as Dun-rowly, Dun-coradel, and Dun-eisten. There are also the remains of some old castles, and other monuments of antiquity. At Stornaway village we see the ruins of a fortress destroyed by the English garrison sent thither by Oliver Cromwell. To the northward of Brago there is a round tower built of large stones, three stories high, tapering towards the top, with a double wall, and a circular staircase between, by which one may go quite round the building. On the heaths and summits of hills there are several cairns or heaps of stones, which served either for graves or beacons. In the parish of

Barvas we see a single stone called the *thruft*, standing upright, above 20 feet high, and almost as much in breadth. Three stones, about 12 feet high each, are seen standing on the north side of Loch-carlway; and many others standing tingle at great distances, and in remote parts of the island. But the most remarkable monument of this kind appears by the village of Claferniss. Here we find 39 pyramidal stones standing upright, about six or seven feet high from the surface, each about two feet in breadth. They are placed in form of an avenue, eight feet wide; the distance between every stone amounting to six feet, and a single piece stands at the entrance. This avenue leads to a circle of 12 stones of the same dimensions, with one in the centre 13 feet in length, and shaped like a rudder: on the east, south, and west sides of this circle, are four stones, such as those that compose this round and avenue, forming three lines, or as it were rays, from the body of the circle. This is supposed to have been a Druid temple; and tradition reports, that the chief Druid stood by the large stone in the centre, and harangued the audience. At the distance of a quarter of a mile there is another circle of the same nature; but without the range and avenue. In all probability, these, as well as the monuments we have described in our account of the Orkneys, and Stone-henge on Salisbury-plain, were places of worship erected by the Druids in time of Pagan superstition. The chief town in Lewis is called *Storn-bay*, from its situation at the head of the bay known by this name: it is a village, consisting of about 60 families, with a church, a grammar-school, and some public-houses: here also resides the steward for the laird of Macleod, who is a proprietor of the island.

There is a considerable number of inferior adjacent isles and rocks, some of which hardly deserve to be mentioned; such as the small island Garve at the mouth of Loch Carlway, Berinfa, Fladda, Bernera Minor, and Bernera Major, Kialily, Cayay, Carvay, Greum, Pabay, Shirem, Vexay, Wuya the Larger and Lesser, and the Flannan islands, which the seamen denominate the *northern hunters*. These are visited every summer by the inhabitants of the Lewis, who go thither in quest of fowls, eggs, down, quills, and feathers, as well as to shear or kill the sheep that are kept here for pasture. As these islands are very steep and rocky, the visitors, after having landed and climbed up the rock by a ladder, uncover their heads, and, making a turn sun-ways, thank God for having escaped the danger they have undergone. In the largest island are the ruins of a chapel dedicated to St Flannan, from whom the isles derive their name. Thither the fowlers repairing, strip themselves of their upper garments, which being laid upon a stone, they advance towards the altar, and repeat three prayers; an exercise which is performed every morning and evening. They observe many other superstitious customs during their residence on these rocks; and when they have landed their boat with their purchase, return to the larger islands. Among the islands belonging to the Lewis, we may likewise take notice of the small isle of Pigmies, so called, because bones resembling those of human creatures, but of very small dimensions, have been dug out of the ground.

The islands of Lewis are divided into the two parishes

Lewis.

of Darvas and Eye, and in each of these one minister is settled; but there is a great number of churches and chapels dedicated to different saints, in the different isles which compose this cluster. All these were sanctuaries before the reformation, but now they are divested of that privilege. The people of these islands are Presbyterians, with a few Protestants of the English communion, and a still smaller number of Roman Catholics. The Protestants observe the festivals of Christmas, Good Friday, Easter and Michaelmas; on the last of which the individuals of both sexes perform an univerſary cavalcade.

LEWIS, or LOUIS, the name of several kings of France. See FRANCE.

LEWIS VII. anno 1137, was the first who had the courage to oppose the encroachments of the popes on the regal authority: pope Innocent II. excommunicated him for appointing an archbishop of Bourges; but Lewis defended his prerogatives, and put the priests to death who had been the authors of the quarrel. In 1147, he put himself at the head of an army of 80,000 men, and marched against the Saracens, in the second crusade, but was defeated; and returning into France by sea, was taken by the Greeks, but rescued by Roger king of Sicily. His queen Eleonora accompanied him in this expedition; and being suspected of infidelity with Saladin, a young Turk, Louis divorced her, and she was married six weeks after to Henry duke of Normandy, (Henry II. king of England). Lewis died in 1180, aged 60.

Lewis IX. anno 1226, (canonized), was one of the greatest monarchs of France; equally memorable for his valour and his virtues, but unfortunately misled by the superstition of the times: he sacrificed his own repose, and the welfare of his kingdom, to the folly of crusading. In 1248, leaving France to the care of his mother, he embarked for Egypt, attended by his queen, his three brothers, and the flower of the French nobility. At first, his victories were rapid: he took Damietta in 1249; but the following year he was defeated and taken prisoner by the Turks, with all the nobility in his train, and the greatest part of his army. The sultan sent to him in prison, to demand an exorbitant sum for his ransom; and his answer being truly noble, deserves to be recorded: "Tell the sultan, that a king of France is not to be ransomed with money; I will give the sum required for my people, and Damietta for myself." These terms were accepted, and a peace of 10 years ensued. Upon his return to France, he diminished the taxes, revoked those which the cupidity of the financiers had introduced; issued several salutary edicts; founded several churches and hospitals; and effectually overturned the ecclesiastical jurisdiction of the court of Rome, by his pragmatic sanction in 1269, which established the independency of the Gallican church. Thirteen years residence in his capital indemnified his subjects for his absence; but his pious zeal prevented the enjoyment of this happiness: he embarked for the sixth crusade in 1270; and died the same year, at the siege of Tunis, aged 55.

Lewis XI. anno 1461. His oppressions obliged his subjects to enter into a league against him, styled, "*Ligue du bien public*," in which his brother the duke of Berri and some of the principal nobility were concerned: they solicited succours from John duke of Cala-

bria, who joined them with 500 Swifs (the first introduction of Swifs soldiers into the French armies). His reign was almost one continued scene of civil war; and it is computed that 4000 of his subjects were executed in public and privately, either for being in arms against him, or suspected by him. In his last illness, he drank the warm blood of children, in the vain hope of restoring his decayed strength. He died in 1483, aged 60. The posts for letters were established in his reign, owing to his eagerness for news; the first institution of this nature in Europe.

Lewis XII. anno 1492, styled the *Just*, and the *Father of his people*; memorable for his valour in the field, and his wisdom in the cabinet. A great general; but unfortunate towards the end of his reign, when he did not command his troops in person: his orders transmitted from home were misunderstood, or wilfully disobeyed; and he had the mortification, before he died, to see the total expulsion of the French from the possessions he had acquired for them by his personal bravery. At 53 years of age, he married the princess Mary of England, sister of Henry VIII. and being of a delicate constitution, fell a victim (according to the French historians) to amorous dalliance; for he died in about two months after his nuptials, in 1515.

Lewis XIII. anno 1610, increased the military reputation of his country, and made considerable additions to its domains. The beginning of his reign was occupied in civil wars with his mother and his Protestant subjects; in which he was excited to continue by his famous minister, cardinal Richieu, who attended him to the siege of Rochelle, the bulwark of the Huguenot party. This place was reduced by famine to surrender, in 1628, after a siege of more than a year. Upon this, and other occasions, the king gave proofs of great personal bravery. His attachment to his ally the duke de Nevers, who succeeded to the duchy of Mantua, but was refused the investiture by Charles VI. emperor of Germany, involved him in a war with that prince, the Spaniards, and the duke of Savoy; in which Lewis was victorious, and obtained a treaty of peace, by which the duke of Mantua was guaranteed in the possession of his dominions. In 1635, a new war broke out between France and Spain, and the emperor took part with the latter: it lasted 13 years against the emperor, and 25 against Spain, with various success; and the different armies kept on foot, in the Low Countries, on the frontiers of France, and in Italy, in the first years of this war, paved the way for the signal successes of Lewis XIV. the campaigns of these armies being a military school of discipline and experience for the French officers, besides giving them a knowledge of the countries which became the seat of war in the next reign. Lewis XIII. died 1643, aged 41.

Lewis XIV. le *Grand*, (king at five years of age), anno 1643. He was at first styled *Dieu-donne*, because the French considered him as the gift of heaven, granted to their prayers after the queen had been barren 22 years. This prince (Ann of Austria) was declared regent by Lewis XIII. and saw herself under a necessity to continue the war against Philip IV. king of Spain, her brother. The duke d'Enguin was made general of the French armies; and so signal was the success of this renowned warrior, (afterwards prince

Lewis.

prince of Condé, and known by the style of the *Great Condé*,) that his victories brought on the advantageous treaties of Munster in 1648, between France, the emperor Ferdinand III. and Christina queen of Sweden: the basis of the aggrandisement of France in this reign; the principal events of which, and of the next, are related under the articles *BRITAIN*, *UNITED PROVINCES*, &c. *Lewis XIV.* died in 1715, aged 77.

*LEWIS XV.* (his great-grandson) succeeded in 1715. He was styled, in the course of his reign, *the well-beloved*, which he lost some years before he died; and was detested and despised by his subjects for his shameful attachment to a young girl, under the title of his *mistress*, who, by the ministry of her patron the duke d'Aiguillon, governed the kingdom, and invaded the ancient rights and privileges of the people. He died in 1774, in the 64th year of his age, and 59th of his reign.

*LEYDEN*, in Latin *Lugdunum Batavorum*, one of the largest and finest cities in Holland, abounds with canals, along which are rows of lofty trees that afford very pleasant walks. An arm, or small branch of the Rhine, runs through it. Over the canals are 145 bridges, most of them of stone or brick. The university here is the oldest in the United Provinces: it has large privileges; a library well furnished, and particularly rich in manuscripts; a physic-garden well stocked with all sorts of plants, many of which have been brought from the Cape of Good Hope and the East Indies; an anatomy-hall, well provided with skeletons; and an observatory. The professors, who are generally very eminent, read public lectures four times a-week, for which they take no money; but about three guineas are paid for a course of private lectures, which lasts a whole year. The students have no distinct habit, but all wear swords, though they generally go to the public and private lectures in their night-gowns and slippers. The salaries of the professors are from 100*l.* to 200*l.* a-year: they wear gowns only when they preside at public disputations, read public lectures, or meet in the senate; and their lectures are always in Latin. The students do not lodge in the university, but where they please in the town. The cloth manufacture here is much decayed, which formerly flourished to such a degree, that 100,000 pieces, it is said, have sometimes been made in a year. The city is famous for the long and severe siege it maintained in 1573 against the Spaniards. We cannot help mentioning the reply of that illustrious magistrate, Adrian de Vries, when the citizens represented to him the havoc made by the famine during the siege, and insisted upon his surrendering: "Friends, (said he), here is my body, divide it among you to satisfy your hunger, but banish all thoughts of surrendering to the cruel and perfidious Spaniard." They took his advice, in regard to their not surrendering, and never would listen to any overtures; but told the Spaniards, they would hold out as long as they had an arm to eat and another to fight. There are some fine churches here, and many long, broad, handsome streets; but the Papists, as at Harlem, are more numerous than the Protestants.

*LEYDEN Phial*, a phial coated on the inside and outside with tinfoil, or other proper conducting substance, and furnished with a brass wire and knob, for giving

the electrical shock. See *ELECTRICITY*, n° 25, 38, 62, 102, &c.

*LEYTE*, one of the Philippine islands in the East Indies, situated in E. Long. 118. o. N. Lat. 11. o. Its greatest length is about 40 leagues, and its circumference about 90 or 100. Its soil on the east side is very fruitful; but there are very high mountains which cut it almost through the middle, and occasion so great an alteration in the air, that when it is winter on the north-side, it is summer on the southern part of the island. Thus when the inhabitants of one half of the year reap, the others sow; and they have two plentiful harvests in a year, to which the rivers running down from the abovementioned mountains contribute not a little. The island contains about 9000 inhabitants, who pay tribute to the Spaniards in rice, wax, and quilts. The people have two good customs; the first, to entertain each other interchangeably when they travel; the other, never to alter the price of provisions on account of any scarcity, and this under severe penalties.

*LHUYD*, or *LHOYD* (Humphrey), a learned antiquarian of the 16th century, born at Denbigh, who applied himself to the study of physic; and living mostly within the walls of Denbigh castle, practised there as a physician; sometimes diverted himself with music; and died in 1570, with the character of a well-bred gentleman. He wrote, and translated, several pieces relative to history and antiquities; in particular "The history of Cambria, now called *Wales*, from Caradoc of Llangarvan, &c." but died before it was finished: however Sir Henry Sidney, lord president of Wales, employed Dr David Powel to finish it, who published it in 1584. A new and improved edition of this work was published in 1774.

*LIBANIUS*, a famous Greek rhetorician and sophist in the 4th century, was born at Antioch, and had a great share in the friendship of Julian the Apostate. That prince offered him the dignity of *Præfectus Prætorio*; but Libanius refused it, thinking the name of *sophist*, or *professor of eloquence*, much more honourable. There are still extant several of his letters and Greek orations, by which he acquired great reputation; but his style is somewhat affected and obscure. He was a pagan. Basil and Chrysostom were his disciples about the year 360. His letters were published at Amsterdam in 1738; his orations at Venice, 1755.

*LIBANUS*, the name of a chain of mountains of Turkey in Asia, which lie between Proper Syria and Palestine, extending from west to east, from the Mediterranean Sea as far as Arabia. The summits of these mountains are so high, that they are always covered with snow; but below are very pleasant and fruitful valleys. They were formerly famous for the great number of cedar-trees growing thereon; but now there are scarce any remaining. Geographers distinguish them into Libanus and Amilbanus; the latter of which lies on the south side of the valley, rising near the ruins of Sidon, and terminates at others in Arabia, in N. Lat. 34. They are separated from each other at an equal distance throughout; and form a basin, or country, called by the ancients *Cælo-Syria*.

*LIBATION*, a religious ceremony among the ancient pagans, which consisted in an effusion of liquors poured

Libaw, poured on the head of the victims prepared for sacrifice.

Libations were also in use among the Hebrews, who poured an hin of wine on the victim after it was killed, and the several pieces of the sacrifice were laid on the altar, ready to be consumed in the flames.

LIBAW, a sea-port town of Courland, lying on the Baltic Sea, consisting entirely of wooden houses. It belongs to the duke of Courland, and is situated in E. Long. 21. 27. N. Lat. 56. 27.

LIBEL, (*libellus famosus*), taken in its largest and most extensive sense, signifies any writing, picture, or the like, of an immoral or illegal tendency; but, in a peculiar sense, is used to denote a malicious defamation of any person, and especially a magistrate, made public by either printing, writing, signs or pictures, in order to provoke him to wrath, or expose him to public hatred, contempt, and ridicule. The direct tendency of these libels is the breach of the public peace, by stirring up the objects of them to revenge, and perhaps to bloodshed. The communication of a libel to any one person is a publication in the eye of the law: and therefore the sending an abusive private letter to a man is as much a libel as if it were openly printed, for it equally tends to a breach of the peace.

With regard to libels in general, there are, as in many other cases, two remedies; one by indictment and another by action. The former for the public offence; for every libel has a tendency to break the peace, or provoke others to break it: which offence is the same whether the matter contained be true or false; and therefore the defendant, on an indictment for publishing a libel, is not allowed to allege the truth of it by way of justification. But in the remedy by action on the case, which is to repair the party in damages for the injury done him, the defendant may, as for words spoken, justify the truth of the facts, and show that the plaintiff has received no injury at all. What was said with regard to words spoken, will also hold in every particular with regard to libels by writing or printing, and the civil actions consequent thereupon: but as to signs or pictures, it seems necessary always to show, by proper *innuendo's* and averments of the defendant's meaning, the import and application of the scandal, and that some special damage has followed; otherwise it cannot appear, that such libel by picture was understood to be levelled at the plaintiff, or that it was attended with any actionable consequences.

In a civil action, then, a libel must appear to be false, as well as scandalous; for, if the charge be true, the plaintiff has received no private injury, and has no ground to demand a compensation from himself, whatever offence it may be against the public peace: and therefore, upon a civil action, the truth of the accusation may be pleaded in bar of the suit. But, in a criminal prosecution, the tendency which all libels have to create animosities, and to disturb the public peace, is the sole consideration of the law. And therefore, in such prosecutions, the only points to be considered are, first, the making or publishing of the book or writing; and, secondly, whether the matter be criminal: and, if both these points are against the defendant, the offence against the public is complete. The punishment of such libellers, for either

making, repeating, printing, or publishing the libel, is a fine, and such corporal punishment as the court in its discretion shall inflict; regarding the quantity of the offence, and the quality of the offender. By the law of the twelve tables at Rome, libels, which affected the reputation of another, were made a capital offence: but, before the reign of Augustus, the punishment became corporal only. Under the emperor Valentinian it was again made capital, not only to write, but to publish, or even to omit destroying them. Our law, in this and many other respects, corresponds rather with the middle age of Roman jurisprudence, when liberty, learning, and humanity, were in their full vigour, than with the cruel edicts that were established in the dark and tyrannical ages of the ancient *decemviri*, or the later emperors.

In this, and other instances, where blasphemous, immoral, treasonable, schismatical, seditious, or scandalous libels are punished by the English law, some with a greater, others with a less degree of severity; the liberty of the press, properly understood, is by no means infringed or violated. See LIBERTY of the Press.

LIBELLA, or LIBELLULA, in the history of insects, a genus of four-winged flies, called in English *dragon-flies* or *adder-flies*; the characters of which are these: The mouth is furnished with jaws: the feelers are shorter than the breast; and the tail of the male terminates in a kind of hooked forceps. There are 21 species, chiefly distinguished by their colour. They have all two very large and reticulated eyes, covering the whole surface of the head. They fly very swiftly; and prey upon the wing, clearing the air of innumerable little flies. They are found in August and September in our fields and gardens, especially near places where there are waters, as they have their origin from worms living in that element. The great ones usually live all their time about waters; but the smaller are common among hedges, and the smallest of all frequent gardens. The smaller kind often settle upon bushes, or upon the ground; but the large ones are almost always upon the wing, so that it is very difficult to take them. Their eyes are beautiful objects for the microscope.

The manner of this insect's coupling with the female is a thing that has attracted the observation and admiration of multitudes, as they are frequently seen, in the hotter months, in that state, flying together about the edges of waters.—Mr Homberg of the Academy of Paris has taken a great deal of pains to inform the world of the whole secret of this strange coitus, and of several other remarkable particulars regarding the creature. The species in which he observed it, is the common libella with a blue body, and large black spots on the wings; and is one of the middle size between the largest and least of these creatures, and is very frequent in moist places in June, July, and August. When the male of this species finds the female sitting upon a leaf or stick, he seizes her as he flies, taking fast hold of her, with the hooks at the anus, by the neck, or that part which joins the head to the breast, and immediately flies away with her, holding her fixed by the neck to the end of his tail. It would not be unnatural, on this occasion, to imagine that they were one species of animal running

away

away with another to devour it: but this thought must be of short duration, since the female will be soon observed to make no attempts to get away; but, on the contrary, to contrive, as well as she can, to be the better carried, and that with less trouble to the male. He does not however carry his female far before he settles himself upon some plant, and raises his tail so that the female may be brought to sit easily under him upon the same plant. As soon as the female is thus seated, she turns up her tail, and brings it between the legs of the male; then places it to a certain part of the breast of the male, in which are the organs of generation in that sex. All this while the male keeps his hold of her neck with his forceps or hooks. They usually remain in this posture about three minutes; and, after that, the male gently raising up his breast, they become separated, and leaving the hold he had on her neck at the same time, he flies away as he pleases. The female usually remains on the place for half a quarter of an hour, and then flies away also.—Mr Homberg having observed the coupling of these animals thus far, was determined to examine the organs used in it, by dissection. His anatomical observations may be seen in Mem. Acad. Paris. 1699.

**LIBER**, in vegetables, the bark or rind, principally of trees. This is to be conceived as consisting of a number of cylindric and concentric surfaces whose texture is reticular, and in some trees plainly extrusible every way, by reason that the fibres are soft and flexible. While in this condition, they are either hollow regular canals, or, if not so, they have interstitial spaces which serve the office of canals. The nutritious juice which they are continually receiving, remains in part in them, makes them grow in length and thickness, and strengthens and brings them closer together; and by this means the texture which was before reticular becomes an assemblage of straight fibres ranged vertically and parallel to each other; that is, as they are thus altered behind one another, they by degrees become a new substance more woody, called *blea*.

**LIBERALIA**, in Roman antiquity, the same with the Dionysia of the Greeks. See **DIONYSIA**.

**LIBERIA**, in Roman antiquity, a festival observed on the 16th of the kalends of April, at which time the youth laid aside their juvenile habit for the toga virilis, or habit peculiar to grown men. See the article **TOGA**.

**LIBERTAS**, **LIBERTY**, in Pagan worship, one of the blessings deified by the Romans, was represented in the form of a virgin clothed in white, holding a sceptre in her right hand and a cap in her left. To this imaginary goddess they erected temples and altars, where they offered up petitions for the preservation of their liberties.

**LIBERTUS**, in Roman antiquity, a person who from being a slave had obtained his freedom.—The difference between the *liberti* and *libertini* was this: the *liberti* were such as had been actually made free themselves, and the *libertini* were the children of such persons.

**LIBERTY**, denotes a state of freedom, in contradistinction to *slavery* or *restraint*; and may be considered as either *natural* or *civil*.

The absolute rights of man, considered as a free

agent, endowed with discernment to know good from evil, and with power of choosing those measures which appear to him to be most desirable, are usually summed up in one general appellation, and denominated the *natural liberty of mankind*. This natural liberty consists properly in a power of acting as one thinks fit, without any restraint or controul, unless by the law of nature; being a right inherent in us by birth, and one of the gifts of God to man at his creation, when he endued him with the faculty of free-will. But every man, when he enters into society, gives up a part of his natural liberty, as the price of so valuable a purchase; and, in consideration of receiving the advantages of mutual commerce, obliges himself to conform to those laws which the community has thought proper to establish. And this species of legal obedience and conformity is infinitely more desirable than that wild and savage liberty which is sacrificed to obtain it. For no man, that considers a moment, would wish to retain the absolute and uncontrouled power of doing whatever he pleases: the consequence of which is, that every other man would also have the same power; and then there would be no security to individuals in any of the enjoyments of life.

*Political* therefore, or *civil*, liberty, which is that of a member of society, is no other than natural liberty so far restrained by human laws (and no farther) as is necessary and expedient for the general advantage of the public. Hence we may collect, that the law, which restrains a man from doing mischief to his fellow citizens, though it diminishes the natural, increases the civil liberty of mankind: but every wanton and causeless restraint of the will of the subject, whether practised by a monarch, a nobility, or a popular assembly, is a degree of tyranny. Nay, that even laws themselves, whether made with or without our consent, if they regulate and constrain our conduct in matters of mere indifference, without any good end in view, are laws destructive of liberty: whereas, if any public advantage can arise from observing such precepts, the controul of our private inclinations, in one or two particular points, will conduce to preserve our general freedom in others of more importance; by supporting that state of society, which alone can secure our independence. Thus the statute of king Edward IV. which forbade the fine gentlemen of those times (under the degree of a lord) to wear pikes upon their shoes or boots of more than two inches in length, was a law that favoured of oppression; because, however ridiculous the fashion then in use might appear, the restraining it by pecuniary penalties could serve no purpose of common utility. But the statute of king Charles II. which prescribes a thing seemingly as indifferent, viz. a dress for the dead, who were all ordered to be buried in woollen, is a law consistent with public liberty; for it encourages the staple trade, on which in great measure depends the universal good of the nation. So that laws, when prudently framed, are by no means subversive, but rather introductive of liberty; for (as Mr Locke has well observed) where there is no law there is no freedom. But then, on the other hand, that constitution or frame of government, that system of laws, is alone calculated to maintain civil liberty, which leaves the subject entire ma-

ster

ster of his own conduct, except in those points wherein the public good requires some direction or restraint.

The idea and practice of this political or civil liberty flourish in their highest vigour in these kingdoms, where it falls little short of perfection, and can only be lost or destroyed by the folly or demerits of its owner; the legislature, and of course the laws of Britain, being peculiarly adapted to the preservation of this inestimable blessing even in the meanest subject. Very different from the modern constitutions of other states on the continent of Europe, and from the genius of the imperial law; which in general are calculated to vest an arbitrary and despotic power, of controuling the actions of the subject, in the prince, or in a few grandes. And this spirit of liberty is so deeply implanted in our constitution, and rooted even in our very soil, that a slave or a negro, the moment he lands in Britain, falls under the protection of the laws, and so far becomes a freeman; though the master's right to his service may possibly still continue.

The absolute rights of every Briton, (which, taken in a political and extensive sense, are usually called their *liberties*) as they are founded on nature and reason, so they are coeval with our form of government; though subject at times to fluctuate and change, their establishment (excellent as it is) being still human. At some times we have seen them depressed by overbearing and tyrannical princes; at others, so luxuriant as even to tend to anarchy, a worse state than tyranny itself, as any government is better than none at all. But the vigour of our free constitution has always delivered the nation from these embarrassments: and, as soon as the convulsions consequent on the struggle have been over, the balance of our rights and liberties has settled to its proper level; and their fundamental articles have been from time to time asserted in parliament, as often as they were thought to be in danger:

First, by the great charter of liberties, which was obtained, sword in hand, from king John, and afterwards, with some alterations, confirmed in parliament by king Henry III. his son. Which charter contained very few new grants; but, as Sir Edward Coke observes, was for the most part declaratory of the principal grounds of the fundamental laws of England. Afterwards, by the statute called *confirmatio cartarum*, whereby the great charter is directed to be allowed as the common law; all judgments contrary to it are declared void; copies of it are ordered to be sent to all cathedral churches, and read twice a-year to the people; and sentence of excommunication is directed to be as constantly denounced against all those that by word, deed, or counsel, act contrary thereto, or in any degree infringe it. Next by a multitude of subsequent corroborating statutes (Sir Edward Coke reckons 32.) from the first Edward to Henry IV. Then, after a long interval, by the *petition of right*; which was a parliamentary declaration of the liberties of the people, assented to by king Charles I. in the beginning of his reign. Which was closely followed by the still more ample concessions made by that unhappy prince to his parliament, before the fatal rupture between them; and by the many salutary laws, particu-

larly the *habeas corpus* act, passed under Charles II. To these succeeded the *bill of rights*, or declaration delivered by the lords and commons to the prince and princess of Orange 13th February 1688; and afterwards enacted in parliament, when they became king and queen: which declaration concludes in these remarkable words; "and they do claim, demand, and insist upon, all and singular the premises, as their undoubted rights and liberties." And the act of parliament itself recognizes "all and singular the rights and liberties asserted and claimed in the said declaration to be the true, ancient, and indubitable rights of the people of this kingdom." Lastly, these liberties were again asserted at the commencement of the present century, in the *act of settlement*, whereby the crown was limited to his present majesty's illustrious house: and some new provisions were added, at the same fortunate æra, for better securing our religion, laws, and liberties; which the statute declares to be "the birthright of the people of England," according to the ancient doctrine of the common law.

Thus much for the *declaration* of our rights and liberties. The rights themselves, thus defined by these several statutes, consist in a number of private immunities; which will appear, from what has been premised, to be indeed no other, than either that *residuum* of natural liberty, which is not required by the laws of society to be sacrificed to public convenience; or else those civil privileges, which society hath engaged to provide, in lieu of the natural liberties so given up by individuals. These therefore were formerly, either by inheritance or purchase, the rights of all mankind; but, in most other countries of the world, being now more or less debased and destroyed, they at present may be said to remain, in a peculiar and emphatical manner, the rights of the people of Britain. And these may be reduced to three principal or primary articles; the right of personal security, the right of personal liberty, and the right of private property: because, as there is no other known method of compulsion, or of abridging man's natural free-will, but by an infringement or diminution of one or other of these important rights, the preservation of these, inviolate, may justly be said to include the preservation of our civil immunities in their largest and most extensive sense. See the article RIGHTS.

In vain, however, would these rights be declared, ascertained, and protected by the dead letter of the laws, if the constitution had provided no other method to secure their actual enjoyment. It has therefore established certain other auxiliary subordinate rights of the subject, which serve principally as barriers to protect and maintain inviolate the three great and primary rights, of personal security, personal liberty, and private property. These are,

1. The constitution, powers, and privileges of parliament; for which see PARLIAMENT,

2. The limitation of the king's prerogative, by bounds so certain and notorious, that it is impossible he should exceed them without the consent of the people; as to which, see PARLIAMENT. The former of these keeps the legislative power in due health and vigour, so as to make it improbable that laws should be enacted destructive of general liberty: the latter is a guard upon the executive power, by restraining it from

liberty. from acting either beyond or in contradiction to the laws that are framed and established by the other.

3. A third subordinate right of every Briton is that of applying to the courts of justice for redress of injuries. Since the law is, in this realm, the supreme arbiter of every man's life, liberty, and property, courts of justice must at all times be open to the subject, and the law be duly administered therein. The emphatical words of *magna carta*, spoken in the person of the king, who in judgment of law (says Sir Edward Coke) is ever present and repeating them in all his courts, are these; *Nulli vendemus, nulli negabimus, aut differemus rectum vel iustitiam*: "and therefore every subject," continues the same learned author, "for injury done to him in bonis, in terris, vel persona, by any other subject, be he ecclesiastical or temporal, without any exception, may take his remedy by the course of the law, and have justice and right for the injury done to him, freely without sale, fully without denial, and speedily without delay." It were endless to enumerate all the affirmative acts of parliament, wherein justice is directed to be done according to the law of the land: and what that law is, every subject knows; or may know if he pleases: for it depends not upon the arbitrary will of any judge; but is permanent, fixed, and unchangeable, unless by authority of parliament. We shall however just mention a few negative statutes, whereby abuses, perversions, or delays of justice, especially by the prerogative, are restrained. It is ordained by *magna carta*, that no freeman shall be outlawed, that is, put out of the protection and benefit of the laws, but according to the law of the land. By 2 Ed. III. c. 8. and 11 Ric. II. c. 10. it is enacted, that no commands or letters shall be sent under the great seal, or the little seal, the signet, or privy seal, in disturbance of the law; or to disturb or delay common right: and, though such commandments should come, the judges shall not cease to do right: which is also made a part of their oath by statute 18 Ed. III. ft. 4. And by 1 W. & M. ft. 2. c. 2. it is declared, that the pretended power of suspending or dispensing with laws, or the execution of laws, by regal authority without consent of parliament, is illegal.

Not only the substantial part, or judicial decisions, of the law, but also the formal part, or method of proceeding, cannot be altered but by parliament: for, if once those outworks were demolished, there would be an inlet to all manner of innovation in the body of the law itself. The king, it is true, may erect new courts of justice; but then they must proceed according to the old established forms of the common law. For which reason it is declared in the statute 16 Car. I. c. 10. upon the dissolution of the court of star-chamber, that neither his majesty, nor his privy-council, have any jurisdiction, power, or authority by English bill, petition, articles, libel (which were the course of proceeding in the star-chamber, borrowed from the civil law) or by any other arbitrary way whatsoever, to examine, or draw into question, determine, or dispose of the lands or goods of any subjects of this kingdom; but that the same ought to be tried and determined in the ordinary courts of justice, and by *course of law*.

4. If there should happen any uncommon injury, or

infringement of the rights before-mentioned, which Liberty. the ordinary course of law is too defective to reach, there still remains a fourth subordinate right, appertaining to every individual, namely, the right of petitioning the king, or either house of parliament, for the redress of grievances. In Russia we are told, that the Czar Peter established a law, that no subject might petition the throne, till he had first petitioned two different ministers of state. In case he obtained justice from neither, he might then present a third petition to the prince; but upon pain of death, if found to be in the wrong. The consequence of which was, that no one dared to offer such third petition; and grievances seldom falling under the notice of the sovereign, he had little opportunity to redress them. The restrictions, for some there are, which are laid upon petitioning in Britain, are of a nature extremely different; and while they promote the spirit of peace, they are no check upon that of liberty. Care only must be taken, lest, under the pretence of petitioning, the subject be guilty of any riot or tumult; as happened in the opening of the memorable parliament in 1640: and, to prevent this, it is provided by the statute 13 Car. II. ft. 1. c. 5. that no petition to the king, or either house of parliament, for any alteration in church or state, shall be signed by above 20 persons, unless the matter thereof be approved by three justices of the peace, or the major part of the grand jury, in the country; and in London, by the lord mayor, aldermen, and common-council: nor shall any petition be presented by more than 10 persons at a time. But, under these regulations, it is declared by the statute 1 W. & M. ft. 2. c. 2. that the subject hath a right to petition; and that all commitments and prosecutions for such petitioning are illegal.

5. The fifth and last auxiliary right of the subject, that we shall at present mention, is that of having arms for their defence, suitable to their condition and degree, and such as are allowed by law. Which is also declared by the same statute 1 W. & M. ft. 2. c. 2. and is indeed a public allowance, under due restrictions, of the natural right of resistance and self-preservation, when the sanctions of society and laws are found insufficient to restrain the violence of oppression.

In these several articles consists the rights, or, as they are frequently termed, the *liberties of Britons*: liberties more generally talked of, than thoroughly understood; and yet highly necessary to be perfectly known and considered by every man of rank or property, lest his ignorance of the points whereon they are founded should hurry him into faction and licentiousness on the one hand, or a pusillanimous indifference and criminal submission on the other. And we have seen that these rights consist, primarily, in the free enjoyment of personal security, of personal liberty, and of private property. So long as these remain inviolate, the subject is perfectly free; for every species of compulsive tyranny and oppression must act in opposition to one or other of these rights, having no other object upon which it can possibly be employed. To preserve these from violation, it is necessary that the constitution of parliaments be supported in its full vigour; and limits, certainly known, be set to the royal prerogative. And, lastly, to vindicate these rights,

*Liberty.* when actually violated or attacked, the subjects of Britain are entitled, in the first place, to the regular administration and free course of justice in the courts of law; next, to the right of petitioning the king and parliament for redress of grievances; and lastly, to the right of having and using arms for self-preservation and defence. And all these rights and liberties it is our birthright to enjoy entire; unless where the laws of our country have laid them under necessary restraints. Restraints in themselves so gentle and moderate, as will appear upon farther inquiry, that no man of sense or probity would wish to see them slackened. For all of us have it in our choice to do every thing that a good man would desire to do; and are restrained from nothing, but what would be pernicious either to ourselves or our fellow-citizens. So that this review of our situation may fully justify the observation of a learned French author, who indeed generally both thought and wrote in the spirit of genuine freedom; and who hath not scrupled to profess, even in the very bosom of his native country, that the British is the only nation in the world, where political or civil liberty is the direct end of its constitution. Recommending therefore to the student in our laws a farther and more accurate search into this extensive and important title, we shall close our remarks upon it with the expiring wish of the famous father Paul to his country, "ESTO PERPETUA!"

*LIBERTY and Necessity.* See *METAPHYSICS*, n° 78.—80.

*LIBERTY of the Press.* The art of printing, soon after its introduction, was looked upon in England, as well as in other countries, as merely a matter of state, and subject to the coercion of the crown. It was therefore regulated with us by the king's proclamations, prohibitions, charters of privilege and licence, and finally by the decrees of the court of star-chamber, which limited the number of printers, and of presses which each should employ, and prohibited new publications unless previously approved by proper licensers. On the demolition of this odious jurisdiction in 1641, the long parliament of Charles I. after their rupture with that prince, assumed the same powers as the star-chamber had exercised with respect to the licensing of books: and in 1643, 1647, 1649, and 1652 (Scobell. i. 44, 134. ii. 88, 230.) issued their ordinances for that purpose, founded principally on the star-chamber decree of 1637. In 1662, was passed the statute 13 & 14 Car II. c. 33. which, with some few alterations, was copied from the parliamentary ordinances. This act expired in 1679; but was revived by statute 1 Jac. II. c. 17. and continued till 1692. It was then continued for two years longer by statute 4 W. & M. c. 24. but though frequent attempts were made by the government to revive it, in the subsequent part of that reign (Com. Journ. 11 Feb. 1694. 26 Nov. 1695. 22 Oct. 1696. 9 Feb. 1697. 31 Jan. 1698.) yet the parliament resisted it so strongly, that it finally expired, and the press became properly free in 1694; and has continued so ever since.

The liberty of the press, however, so essential to the nature of a free state, consists not in freedom from censure for any criminal matter that may be published, but in laying no previous restraints upon publications. Every freeman has undoubtedly a right to lay what

sentiments he pleases before the public; to forbid this, is to destroy the freedom of the press: but if he publishes what is improper, mischievous, or illegal, he must take the consequence of his own temerity \*. To subject the press to the restrictive power of a licenser in the manner abovementioned, is to subject all freedom of sentiment to the prejudices of one man, and make him the arbitrary and infallible judge of all controverted points in learning, religion, and government. But to punish (as the law does at present) any dangerous or offensive writings which, when published, shall, on a fair and impartial trial, be adjudged of a pernicious tendency, is necessary for the preservation of peace and good order, of government and religion, the only solid foundations of civil liberty. Thus the will of individuals is still left free; the abuse only of that free-will is the object of legal punishment. Neither is any restraint hereby laid upon freedom of thought or inquiry; liberty of private sentiment is still left; the disseminating or making public of bad sentiments, destructive of the ends of society, is the crime which society corrects. A man (says a fine writer on this subject) may be allowed to keep poisons in his closet, but not publicly to vend them as cordials. And to this we may add, that the only plausible argument heretofore used for restraining the just freedom of the press, "that it was necessary to prevent the daily abuse of it," will entirely lose its force, when it is shewn, (by a seasonable exertion of the laws) that the press cannot be abused to any bad purpose without incurring a suitable punishment: whereas, it can never be used to any good one when under the controul of an inspector. So true will it be found, that to censure the licentiousness, is to maintain the liberty of the press.

*LIBETHRA*, (anc. geog.) the fountain of song, was situated in Magnesia, a district of Macedonia, annexed to Thessaly; distinct from the town of Libethra, which stood on mount of Olympus, where it verges towards Macedonia: hence the Muses are called *Libethrides*, (Virgil.) Strabo places on Helicon, not only Hippocrene, and the temple of the Muses, but also the cave of the nymphs Libethrides.

*LIBETHRIUS MONS*, (anc. geog.) a mountain of Boeotia, distant from Coronea 40 stadia; where stood the statues of the Muses, and of the nymphs, surnamed *Libethrine*. A mountain probably conjoined with, or at least very near to, Helicon.

*LIBITINA*, in Pagan worship, the goddess of funerals, is believed by some to have been the same with Proserpine. She had a temple at Rome, in which every thing proper for funerals was kept; and which were either bought or borrowed of her priests, called *libitinarii*, as every one had occasion.

*LIBNA*, (anc. geog.), a sacerdotal city in the tribe of Judah; a place of strength, as appears from Sennacherib's laying siege to it, 2 Kings xix. Isaiah xxvii. In Jerome's time, a village, called *Lobna*, in the territory of Eleutheropolis.

*LIBOURNE*, a town of France, in Guienne, and in Bourdelois. It is a populous trading town, and is seated on the river Dordogne. W. Long. o. 10. N. Lat. 44. 55.

*LIBRA*, the BALANCE, in astronomy. See there, n° 206.

Libertas  
Libra.  
• See  
Libel.

library LIBRA, in Roman antiquity, a pound weight, also a coin equal in value to 20 denarii.

LIBRARY, an edifice or apartment defined for holding a considerable number of books placed regularly on shelves; or, the books themselves lodged in it.

The first who erected a library at Athens was the tyrant Pisistratus, which was transported by Xerxes into Persia, and afterwards brought back by Seleucus Nicanor to Athens. Plutarch says, that under Eumenes there was a library at Pergamus that contained 200,000 books. That of Ptolemy Philadelphus, according to A. Gellius, contained 700,000, which were all burnt by Cæsar's soldiers. Constantine and his successors erected a magnificent one at Constantinople, which in the eighth century contained 300,000 volumes; and among the rest, one in which the Iliad and Odyssey were written in letters of gold, on the guts of a serpent; but this library was burnt by order of Leo Isaurus. The most celebrated libraries of ancient Rome; were the Ulpian and the Palatine, and in modern Rome, that of the Vatican. The foundation of the Vatican library was laid by pope Nicholas, in the year 1450; it was afterwards destroyed in the sacking of Rome by the constable of Bourbon, and restored by pope Sixtus V. and has been considerably enriched with the ruins of that of Heidelberg, plundered by count Tilly in 1682. One of the most complete libraries in Europe, is that erected by Cosmo de Medicis; though it is now exceeded by that of the French king, which was begun by Francis I. augmented by cardinal Richelieu, and completed by M. Colbert. The emperor's library at Vienna, according to Lambecius, consists of 80,000 volumes, and 15,940 curious medals. The Bodleian library at Oxford exceeds that of any university in Europe, and even those of any of the sovereigns of Europe, except the emperor's and the French king's, which are each of them older by 100 years. It was first opened in 1602, and has since been increased by a great number of benefactors: indeed, the Medicean library, that of Basilian at Venice, and those just mentioned, exceed it in Greek manuscripts; but it outdoes them all in Oriental manuscripts; and as to printed books, the Ambrosian at Milan, and that at Wolfenbüttele, are two of the most famous, and yet both are inferior to the Bodleian. The Cotton library consists wholly of manuscripts, particularly of such as relate to the history and antiquities of Britain; which, as they are now bound, make about 1000 volumes.

In Edinburgh there is a good library belonging to the university, well furnished with books; which are kept in good order. There is also a noble library of books and manuscripts belonging to the faculty of Advocates. See ADVOCATE.

LIBRATION, in astronomy, an apparent irregularity of the moon's motion, whereby she seems to librate about her axis, sometimes from the east to the west, and now and then from the west to the east. See ASTRONOMY, n° 221.

LIBURNIA (anc. geogr.), a district of Illyricum, extending towards the Adriatic between Istria on the west, Dalmatia on the east, and mount Albius on the north. *Liburni*, the people. The apparitors, who at the command of the magistrate summoned the

people from the country, were called *Liburni*, because generally men of *Liburnia*. *Liburna*, or *Liburnica*, (Horace), denoted a kind of light and swift skiffs, used by the Liburnians in their sea-rovings or piracies, for which they were noted. *Liburnum* (Juvenal), a species of litters, made in form of Liburnian skiffs, where in the noblemen of Rome were carried, and where they sat at their ease, either reading or writing, (Juvenal).

LIBURNUS (Polybius), a mountain of Campania. Also a port of Tuscany. Now *Livorno*, or *Leghorn*. E. Long. 11. N. Lat. 43. 30.

LIBYA, in general, according to the Greeks, denoted Africa. An appellation derived from *Lub*, "thirst," being a dry and thirsty country.

LIBYA, in a more restrained sense, was the middle part of Africa, extending north and west, (Pliny); between the Mediterranean to the north, the Atlantic to the west, the Ethiopic to the south, and Ethiopia to the east; and was two-fold, the *Hither* or *Exterior Libya*; and the *Farther* or *Interior*. The former lay between the Mediterranean on the north, and the *Farther Libya* and Ethiopia beyond Egypt on the south, (Ptolemy). The *Farther* or *Interior Libya*, was a vast country, lying between the *Hither Libya* on the north, the Atlantic ocean on the west, the Ethiopic on the south, and Ethiopia beyond Egypt on the east, (Ptolemy).

LIBYA, in a still more restrained sense, called, for distinction's sake, *Libya Propria*, was a northern district of Africa, and a part of the *Hither Libya*; situated between Egypt to the east, the Mediterranean to the north, the Syrtis Major and the Regio Tripolitana to the west, the Garamantes and Ethiopia beyond Egypt to the south. Now the kingdom and desert of *Barca*. This Libya was again subdivided into *Libya*, taken in the strictest sense of all, and into Marmarica and Cyrenaica. *Libya* in the strictest sense, otherwise the *Exterior*, was the most eastern part of *Libya Propria*, next to Egypt, with Marmarica on the west, the Mediterranean on the north, and the Nubi, now called *Nubia*, to the south, (Ptolemy).

LICE. See PEDICULUS.

Crab-LICE, so called from their resemblance to crab-fish. They infest the arm-pits, eye-lids, eye-brows, and pudenda of grown persons. They are flattish, and stick so close to the skin, that they can scarce be removed. They are also called *placule*, *petole*, *peffolata*, and, from their often infesting the pubes, they are called *pediculi inguinales*. They are destroyed either with black soap, mercurial ointments, oil of lavender, or a solution of sublimate in rose-water; of which last the proportion may be one drachm of sublimate to a pound of the water.

LICENCE, in law, an authority given to a person to do some lawful act.

LICENSER of the Press. See LIBERTY of the Press.

LICENTIATE, one who has obtained the degree of a licence.—The greatest number of the officers of justice in Spain are distinguished by no other title than that of *licentiate*. In order to pass *licentiate* in common law, civil law, and physic, they must have studied seven years, and in divinity 10. Among us a *licentiate* usually means a physician who has a licence to practise, granted by the college of physicians.

LICHEN, LIVER WORT; a genus of the order of algae, belonging to the cryptogamia class of plants. There are upwards of 100 species, all natives of Britain. The most remarkable are,

1. The geographicus; it is frequent in rocks, and may be readily distinguished at a distance. The crust or ground is of a bright greenish-yellow colour, sprinkled over with numerous plain black tubercles; which frequently run into one another, and form lines resembling the rivers in a map, from which last circumstance it takes its name.

2. The calcareous, or black-nobbed dyer's lichen, is frequent on calcareous rocks; and hath a hard, smooth, white, stony, or tartareous crust, cracked or tessellated on the surface, with black tubercles. Dillenius relates, that this species is used in dyeing, in the same manner as the tartareus after-mentioned.

3. The ventosus, or red spangled tartareous lichen, hath a hard tartareous crust, cracked and tessellated on the surface, of a pale-yellow colour when fresh, and a light olive when dry. The tubercles are of a blood-red colour at top, their margin and base of the same colour as the crust. The texture and appearance of this, (according to Mr Lightfoot) indicate that it would answer the purposes of dyeing as well as some others of this tribe, if proper experiments were made.

4. The candelarius, or yellow farinaceous lichen, is common upon walls, rocks, boards, and old pales. There are two varieties. The first has a farinaceous crust, of no regular figure, covered with numerous, small, greenish-yellow, or olive shields, and grows commonly upon old boards. The other has a smooth, hard, circular crust, wrinkled and lobed at the circumference, which adheres closely to rocks and stones. In the centre are numerous shields of a deeper yellow or orange colour, which, as they grow old, swell in the middle, and assume the figure of tubercles. The inhabitants of Smaland in Sweden scrape this lichen from the rocks, and mix it with their tallow, to make golden candles to burn on festival days.

5. The tartareus, or large yellow-fancier'd dyer's lichen, is frequent on rocks, both in the Highlands and Lowlands of Scotland. The crust is thick and tough, either white, or greenish-white, and has a rough warted surface. The shields are yellow or buff-coloured, of various sizes, from that of a pin's head to the diameter of a silver penny. Their margins are of the same colour as the crust. This lichen is much used by the Highlanders for dyeing a fine claret or pompadour colour. For this purpose, after scraping it from the rocks, and cleaning it, they steep it in urine for a quarter of a year. Then taking it out, they make it into cakes, and hang them up in bags to dry. These cakes are afterwards pulverised, and the powder is used to impart the colour with an addition of alum.

6. The parellus, or crawfish-eye lichen, grows upon wall and rocks, but is not very common. The crusts spread closely upon the place where they grow, and cover them to a considerable extent. They are rough, tartareous, and ash-coloured, of a tough coriaceous substance. The shields are numerous and crowded, having white or ash-coloured, shallow, plain discs, with obtuse margins. This is used by the French for

dyeing a red colour.

7. The saxatiles, or grey-blue pitted lichen, is very common upon trunks of trees, rocks, tiles, and old wood. It forms a circle two or three inches diameter. The upper surface is of a blue-grey and sometimes of a whitish ash-colour, uneven, and full of numerous small pits or cavities; the under-side is black, and covered all over, even to the edges, with short simple hairs or radicles. A variety sometimes occurs with leaves tinged of a red or purple colour. This is used by finches and other small birds in constructing the outside of their curiously formed nests.

8. The omphalodes, or dark-coloured dyers lichen, is frequent upon rocks. It forms a thick widely expanded crust of no regular figure, composed of numerous imbricated leaves of a brown or dark-purple colour, divided into small segments. The margins of the shields are a little crisped and turned inwards, and their outside ash-coloured. This lichen is much used by the Highlanders in dyeing a reddish brown colour. They steep it in urine for a considerable time, till it becomes soft and like a paste; then, forming the paste into cakes, they dry them in the sun, and preserve them for use in the manner already related of the Tartareus.

9. The parietinus, or common yellow wall-lichen, is very common upon walls, rocks, tiles of houses, and trunks of trees. It generally spreads itself in circles of two or three inches diameter, and is said to dye a good yellow or orange colour with alum.

10. The islandicus, or eatable Iceland lichen, grows on many mountains both of the Highlands and Lowlands of Scotland. It consists of nearly erect leaves about two inches high, of a stiff substance when dry, but soft and pliant when moist, variously divided without order into broad distant segments, bifid or trifid at the extremities. The upper or interior surface of the leaves is concave, chestnut-colour, smooth, and shining, but red at the base; the under or exterior surface is smooth and whitish, a little pitted, and sprinkled with very minute black warts. The margins of the leaves and all the segments from bottom to top are ciliated with small, short, stiff, hair-like spinules, of a dark chestnut colour, turning towards the upper side. The shields are very rarely produced. For the uses of this as an esculent herb, see ICELAND n° 16. Made into broth or gruel, it is said to be very serviceable in coughs and consumptions; and, according to Haller and Scopoli, is much used in these complaints in Vienna.

11. The pulmonarius, or lungwort lichen, grows in shady woods upon the trunks of old trees. The leaves are as broad as a man's hand, of a kind of leather-like substance, hanging loose from the trunk on which it grows, and lacinated into wide angular segments. Their natural colour, when fresh, is green; but in drying, they turn first to a glaucous and afterwards to a fuscous colour. It has an astringent, better taste; and, according to Gmelin, is boiled in ale in Siberia, instead of hops. The ancients used it in coughs and asthma, &c. but it is not used in modern practice.

12. The calcarius, or beaked lichen, grows sometimes upon trees but more frequently upon rocks, especially on the sea-coasts, but is not very common. It is smooth, glossy, and whitish, producing flat or convex shields

shields, of the same colour as the leaves, very near the summits of the segments, which are acute and rigid, and, being often reflected from the perpendicular by the growth of the shields, appear from under their limbs like a hooked beak. This will dye a red colour; and promises, in that intention, to rival the famous *Lichen Rocella* or *Argol*, which is brought from Canary Islands, and sometimes sold at the price of 80l. per ton. It was formerly used instead of starch to make hair-powder.

13. The prunastri, or common ragged hoary lichen, grows upon all sorts of trees; but is generally moist white and hoary on the sloe and old plum trees or upon old pales. This is the most variable of the whole tribe of lichens, appearing different in figure, magnitude and colour, according to its age, place of growth, and sex. The young plants are of a glaucous colour, slightly divided into small acute crested segments. As they grow older, they are divided like a stag's horn, into more and deeper segments, somewhat broad, flat, soft, and pitted on both sides, the upper surface of a glaucous colour, the under one white and hoary.—The male plants, as Linnaeus terms them, are short, seldom more than an inch high, not hoary on the under-side; and have pale glaucous shields situated at the extremities of the segments, standing on short peduncles, which are only small stiff portions of the leaf produced.—The female specimens have numerous farinaceous tubercles both on the edges of their leaves, and the wrinkles of their surface.—The pulverized leaves have been used as a powder for the hair, and also in dying yarn of a red-colour.

14. The juniperinus, or common yellow tree-lichen, is common upon the trunks and branches of elms and many other trees. Linnaeus says it is very common upon the juniper. The Gothland Swedes dye their yarn of a yellow colour with it, and give it as a specific in the jaundice.

15. The caninus, or ash-coloured ground-liverwort, grows upon the ground among moss, at the roots of trees in shady woods, and is frequent also in heaths and stony places. The leaves are large, gradually dilated towards the extremities, and divided into roundish elevated lobes. Their upper side, in dry weather, is ash-coloured; in rainy weather, of a dull fuscous green colour; their under-side white and hoary, having many thick downy nerves from which descend numerous, long, white, pencil-like radicles. The peltæ, or shields, grow at the extremities of the elevated lobes, shaped like the human nail; of a roundish oval form, convex above, and concave beneath; of a chocolate colour on the upper side, and the same colour with the leaves on the under. There are two varieties, the one called *reddish*, and the other *many-fingered* ground-liverwort. The former is more common than the other. This species has been rendered famous by the celebrated Dr Mead, who asserted that it was an infallible preventative of the dreadful consequences attending the bite of a mad dog. He directed half an ounce of the leaves dried and pulverized to be mixed with two drachms of powdered black pepper. This was to be divided into four doses, one of which was to be taken by the patient every morning fasting, for four mornings successively, in half a pint of warm cow's milk; after which he was to

use the cold bath every morning for a month.—It is much to be lamented, however, that the success of this medicine, or indeed any other recommended for the same purpose, hath not always answered the expectation. There are instances where the application hath not prevented the hydrophobia, and it is even uncertain whether it has ever been instrumental in keeping off that disorder.

16. The aphthosus, or green ground-liverwort with black warts, grows upon the ground at the roots of trees in woods, and other stony and mossy places. It differs very little from the foregoing, and according to some is only a variety of it. Linnaeus informs us, that the country-people of Upland in Sweden give an infusion of this lichen in milk to children that are troubled with the disorder called the *thrush* or *aphthæ*, which induced that ingenious naturalist to bestow upon it the trivial name of *aphthosus*. The same writer also tells us, that a decoction of it in water purges upwards and downwards, and will destroy worms.

17. The cocciferus, or scarlet-tipped cup-lichen, is frequent in moors and heaths. It has in the first state a granulated crust for its ground, which is afterwards turned into small lacinated leaves, green above, and hoary underneath. The plant assumes a very different aspect, according to the age, situation, and other accidents of its growth; but may be in general readily distinguished by its fructifications, which are fungous tubercles of a fine scarlet colour, placed on the rim of the cup, or on the top of the stalk. These tubercles, steeped in an alkaline lixivium, are said to dye a fine durable red colour.

18. The rangiferinus, or rein-deer lichen, is frequent in woods, heaths, and mountainous places. Its general height, when full-grown, is about two inches. The stalk is hollow, and very much branched from bottom to top; the branches are divided and subdivided, and at last terminated by two, three, four, or five very fine, short, nodding horns. The axillæ of the branches are often perforated. The whole plant is of a hoary white or grey colour, covered with white farinaceous particles, light and brittle when dry, soft and elastic when moist. The fructifications are very minute, round, fuscous, or reddish-brown tubercles, which grow on the very extremities of the finest branches; but these tubercles are very seldom found. The plant seems to have no foliaceous ground for the base, nor scarcely any visible roots.—Linnaeus tells us, that in Lapland this moss grows so luxuriant that it is sometimes found a foot high. There are many varieties of this species, of which the principal is the sylvaticus, or brown-tipt rein-deer lichen. The most remarkable difference between them is, that the sylvaticus turns fuscous by age, while the other always continues white. For the uses of these species, see LAPLAND.

19. The picatus, or official stringy lichen, grows on the branches of old trees, but is not very common. The stalks are a foot or more in length, cylindrical, rigid, and string-shaped, very irregularly branched, the branches entangled together, of a cinereous or ashy-colour, brittle and stringy if doubled short, otherwise tough and pliant, and hang pendent from the trees on which they grow. The shields grow gene-  
rally

Lichten-  
berg  
||  
Licinius.

rally at the extremities of the branches, are nearly flat, or slightly concave, thin, ash-coloured above, pale-brown underneath, and radiated with fine rigid fibres. As the plant grows old, the branches become covered with a white, rough, warty crust; but the young ones are destitute of it. It was formerly used in the shops as an astringent to stop hemorrhages, and to cure ruptures; but is out of the modern practice. Linnæus informs us, that the Laplanders apply it to their feet to relieve the excoriations occasioned by much walking.

20. The *barbatus*, or bearded lichen, grows upon the branches of old trees in thick woods and pine-forests. The stalks or strings are slightly branched and pendulous, from half a foot to two feet in length, little bigger than a taylor's common sewing thread; cylindrically jointed towards the base; but furrowed every where else with numerous, horizontal, capillary fibres, either simple, or slightly branched. Their colour is a whitish green. This has an astringent quality like the preceding. When steeped in water, it acquires an orange colour; and, according to Dillenius, is used in Pennsylvania for dying that colour.

21. The *vulpinus*, or gold-wiry lichen, grows upon the trunks of old trees, but is not very common. It is produced in erect tufts, from half an inch to two inches in height, of a fine yellow or lemon colour, which readily discovers it. The filaments which compose it are not cylindrical, but a little compressed and uneven on the surface, variously branched, the angles obtuse, and the branches straggling and entangled one with another. Linnæus informs us, that the inhabitants of Smoland in Sweden dye their yarn of a yellow colour with this lichen; and that the Norwegians destroy wolves by stuffing dead carcasses with this moss reduced to powder, and mixed with pounded glass, and so exposing them in the winter-season to be devoured by those animals.

**LICHTENBERG**, a castle of France, in Lower Alsace, and the chief place of a county of the same name; seated on a rock, near the mountains Vosges, and is looked upon as impregnable. E. Long. 7. 35. N. Lat. 48. 55.

**LICHTENBURG**, a town of Germany, in the circle of Franconia, and margravate of Culmbach. E. Long. 12. o. N. Lat. 50. 26.

**LICHTENFELS**, a town of Germany, in the circle of Franconia, and bishoprick of Bamberg, seated on the river Mayne, in E. Long. 11. 10. N. Lat. 50. 20.

**LICHTENSTEIN**, a town of Switzerland, in Tockberg, seated on the river Thour. E. Long. 2. 15. N. Lat. 47. 25.

**LICHTSTALL**, an handsome town of Switzerland, in the county of Basle; seated on the river Elgetz. in E. Long. 7. 57. N. Lat. 47. 40.

**LICINIUS STOLO**, a famous Roman tribune, styled *Stolo* on account of a law he made, while tribune, that no Roman citizen should possess more than 500 acres of land; alleging, that when they occupied more, they could not cultivate it with care, nor pull up the useless shoots (*stolones*) that grow from the roots of trees. He is memorable also for enacting, that one of the consuls should always be of a Plebeian family. He lived about 362 B. C.

**LICOLA**, or **LACO-DI-LICOLA**, a lake in the kingdom of Naples, formerly famous for plenty of excellent fish; but in the year 1538 an explosion of a volcano changed one part of it into a mountain of ashes, and the other into a morass. It was anciently known by the name of the Lucrine-lake.

**LICTORS**, in Roman antiquity, twelve officers or sergeants, appointed by Romulus the founder of Rome, to attend him whenever he should appear in public; each of them bearing a battle-ax stuck in a bundle of rods, which was then the usual symbol of sovereignty in the petty states of Hetruria. It was also a part of their office to be the public executioners in beheading, scourging, &c.

**LIDD**, a town of Kent in England, seated in Rumney-marsh, and is one of the Cinque-ports. On the east side of it is a heap of stones, which they pretend was the tomb of Crispin and Crispianus.

**LIDKOPING** a town of West Gothland in Sweden, seated on the lake Wenar, in E. Long. 13. 40. N. Lat. 58. 25.

**LIECHTENAU**, a town of Germany, in the circle of Franconia and Margravate of Anspach, subject to Nuremberg. E. Long. 9. 5. N. Lat. 48. 43.

**LIEGE**, (*Ligeur*), in law, is used for *liege-lord*, and sometimes for *liege-man*: *liege-lord* is he that acknowledgeth no superior, and *liege-man* is he who oweth allegiance to his *liege-lord*, 34 & 35 H. VIII. The king's subjects are called *lieges* or *liege-people*, because they owe and are bound to pay allegiance to him. Stat. 8. H. VI. c. 10, 14. H. VIII. c. 2. But in ancient times, private persons, as lords of manors, &c. had their lieges. Skene says that this word is derived from the Italian *Liga*, a bond or league.

**LIEGE-Pouffie**, in Scots law, is opposed to death-bed; and signifies a person's enjoying that state of health in which only he can dispose of his property at pleasure.

**LIEGE**, a bishopric of Germany, in the circle of Westphalia; bounded to the north by Brabant, to the south by Champagne and Luxemburg, to the east by Limburg and Juliers, and to the west by Brabant, Namur, and Hainault. It is very unequal both in length and breadth; the former being in some places above 90 miles, in others not half so much; and the latter in some places 45, in others hardly 25. The air here is very temperate; and the soil fruitful in corn, wine, wood, and pasture. Here also are mines of lead and iron, pits of coal, quarries of marble and stone, and some celebrated mineral waters, as those of Spa and Chau-fontaine. The principal rivers are, the Maes and Sambre. The manufactures and commodities of the country, are chiefly beer, arms, nails, serge, leather, with the products we have just mentioned. The states of the bishopric are composed of three bodies: the first is the chapter of Liege; the second, the nobility of the country; and the third, the deputies of the capital and the other towns. The three estates are seldom called together, except to raise taxes for the service of the province, or upon some particular emergency; but there is a committee of the states, who meet thrice a-week, and in time of war daily. They are always about the prince-bishop, to make remonstrances, and demand the redress of grievances. The bishop is spiritual and temporal lord

Liecl.  
||  
Liege.

of the whole country ; but, as bishop, is suffragan to the archbishop of Cologne. He styles himself by the *grace of God, bishop and prince of Liege, duke of Bouillon, marquis of Franchimont, count of Loos, Hoorn, &c.* His arms for Liege, are, a pillar argent, on a pedestal of the same, with a crown or, in a field ruby. In the matricula he was formerly rated at 50 horse, and 170 foot ; or 1280 florins monthly, in lieu of them, but now only at 826. An abatement of one third has also been granted of the ancient assessment to the chamber-court, which was 360 rix-dollars 62½ kruitzers for each term. Here are several colleges which sit at Liege, for the government of the country, and the decision of causes, civil, criminal, spiritual and feudal, and of such also as relate to the finances. The chapter consists of 60 persons, who must either prove their nobility for four generations, both by father and mother, before they can be admitted ; or if they cannot do that, must at least have been doctors or licentiates of divinity for seven years, or, of law, for five years, in some famous university. The bishopric is very populous and extensive, containing 1500 parishes, in which are 24 walled towns, besides others, 52 baronies, besides counties and feignories, 17 abbeys for men, who must be all gentlemen, and 11 for ladies, exclusive of others.

LIEGE, the capital of the bishopric of the same name, stands upon the Maes, in a fine valley, surrounded with woods and hills, being a free imperial city, and one of the largest and most eminent in Europe. Though it is 100 miles from the sea by water, the Maes is navigable up to it. The city has 16 gates ; 17 bridges, some of them very handsome ; 154 streets, many of them straight and broad ; a fine episcopal palace ; a very large stately cathedral, in which, besides five great silver coffers full of reliques, are several silver statues of saints, and a St George on horseback of massy gold, presented to the cathedral by Charles the Bold, by way of atonement for using the inhabitants cruelly in the year 1468. Of the other churches, that of St Paul is the most remarkable, both for its structure and fine ornaments in painting and marble. The city is well fortified, and there are also two castles on the mountain of the Holy Wallburg for its defence. Besides a great number of other convents of both sexes, here is a college of English Jesuits, founded in the year 1616, and a fine nunnery of English ladies. Indeed, churches, convents, and other religious foundations, take up the greater part of it. The reader, therefore, no doubt, will take it for granted, that it is a most blessed, holy, and happy city. But however it may fare with the profane, unhallowed laity, it is certainly the paradise of priests, as it is expressly called, by way of eminence. It is divided into the old and new, or the upper and lower ; and the latter again into the island, and the quarter beyond the Maes. The houses are high, and built of bluish marble. In the town and suburbs are 12 public places or squares, 10 hospitals, a beguin-house, and two fine keys, planted with several rows of trees, for the burghers to take the air ; but a great part of that within the walls is taken up with orchards and vineyards. The manufactures of this city are arms, nails, leather, serge, and beer. In St William's convent, without the city, is the tomb of the famous

English traveller Sir John Mandeville, with an inscription in barbarous French, requesting those who read it to pray for his soul. Near it are kept the saddle, spurs, and knife, that he made use of in his travels. After having seen most of the cities of any note in the world, he made choice of this to spend the eve of his life in. A little way from the city, on the other side the Maes, stands the episcopal palace of Seraing, in which the bishops generally reside during the summer. The latitude of this city is 50° 36'. and the longitude 5° 40'.

LIENTERY, a flux of the belly, in which the aliments are discharged as they are swallowed, or very little altered either in colour or substance. See (Index subjoined to) MEDICINE.

LIEUTENANT, an officer who supplies the place and discharges the office of a superior in his absence. Of these, some are civil, as the lords lieutenants of kingdoms, and the lords-lieutenants of counties ; and others are military, as the lieutenant-general, lieutenant-colonel, &c.

Lord LIEUTENANT of Ireland, is properly a viceroy ; and has all the state and grandeur of a king of England, except being served upon the knee. He has the power of making war and peace, of bestowing all the offices under the government, of dubbing knights, and of pardoning all crimes except high treason ; he also calls and prorogues the parliament, but no bill can pass without the royal assent. He is assisted in his government by a privy-council ; and, on his leaving the kingdom, he appoints the lords of the reGENCY, who govern in his absence.

Lord LIEUTENANTS of Counties, are officers, who, upon any invasion or rebellion, have power to raise the militia, and to give commissions to colonels and other officers, to arm and form them into regiments, troops, and companies. Under the lords-lieutenants, are deputy-lieutenants, who have the same power ; these are chosen by the lords-lieutenants, out of the principal gentlemen of each county, and presented to the king for his approbation.

LIEUTENANT-Colonel. See COLONEL.

LIEUTENANT-General. See GENERAL.

LIEUTENANT, in the land-service, is the second commissioned officer in every company of both foot and horse, and next to the captain, and who takes the command upon the death or absence of the captain.

LIEUTENANT of Artillery. Each company of artillery hath four ; 1 first and 3 second lieutenants. The first lieutenant has the same detail of duty with the captain ; because in his absence he commands the company : he is to see that the soldiers are clean and neat ; that their clothes, arms, and accoutrements, are in good and serviceable order ; and to watch over every thing else which may contribute to their health. He must give attention to their being taught the exercise, see them punctually paid, their messes regularly kept, and to visit them in the hospitals when sick. He must assist at all parades, &c. He ought to understand the doctrine of projectiles and the science of artillery, with the various effects of gun-powder, however managed or directed ; to enable him to construct and dispose his batteries to the best advantage ; to plant his cannon, mortars, and howitzers, so as to produce the greatest annoyance to an enemy. He is to be well

skilled

Lientery  
Lieutenant.

Lieutenant, skilled in the attack and defence of fortified places; and to be conversant in arithmetic, mathematics, mechanics, &c.

||  
Ligerius.

*Second Lieutenant in the Artillery*, is the same as an ensign in an infantry regiment, being the youngest commissioned officer in the company, and must assist the first lieutenant in the detail of the company's duty. His other qualifications should be equal with those of the first lieutenant.

*Lieutenant of a Ship of War*, the officer next in rank and power to the captain, in whose absence he is accordingly charged with the command of the ship, as also the execution of whatever orders he may have received from the commander relating to the king's service.

The lieutenant who commands the watch at sea, keeps a list of all the officers and men thereto belonging, in order to muster them when he judges it expedient, and report to the captain the names of those who are absent from their duty. During the night-watch, he occasionally visits the lower decks, or sends thither a careful officer, to see that the proper centinels are at their duty, and that there is no disorder amongst the men; no tobacco smoked between decks, nor any fire or candles burning there, except the lights which are in lanterns, under the care of a proper watch, on particular occasions. He is expected to be always upon deck in his watch, as well to give the necessary orders with regard to trimming the sails and superintending the navigation, as to prevent any noise or confusion; but he is never to change the ship's course without the captain's directions, unless to avoid an immediate danger.

The lieutenant, in time of battle, is particularly to see that all the men are present at their quarters, where they have been previously stationed according to the regulations made by the captain. He orders and exhorts them every where to perform their duty; and acquaints the captain at all other times of the misbehaviour of any person in the ship, and of whatever else concerns the service or discipline.

The youngest lieutenant in the ship, who is also styled *lieutenant at arms*, besides his common duty, is particularly ordered, by his instructions, to train the seamen to the use of small arms, and frequently to exercise and discipline them therein. Accordingly his office in time of battle, is chiefly to direct and attend them; and at all other times to have a due regard to the preservation of the small arms, that they be not lost or embezzled, and that they are kept clean and in good condition for service.

*Lieutenant Reformed*, he whose company or troop is broke or disbanded, but continued in whole or half-pay, and still preserves his right of seniority and rank in the army.

*LIFE*, is peculiarly used to denote the animated state of living creatures, or the time that the union of their soul and body lasts.

*LIFE-RENT*, in Scots law. When the use and enjoyment of a subject is given to a person during his life, it is said to belong to him in life-rent.

*LIGAMENT*, in anatomy, a strong compact substance, serving to join two bones together.

*LIGARIUS* (Quintus), a Roman proconsul in

Africa, 49 B.C. Taking part with Pompey, he was forbid by Julius Cæsar to return to Rome: to obtain his pardon, Cicero made that admired oration in his defence which has immortalized the memory of the client with that of his celebrated advocate.

*LIGATURE*, in surgery, is a cord, band, or string; or the binding any part of the body with a cord, band, fillet, &c. whether of leather, linen, or any other matter.

Ligatures are used to extend or replace bones that are broken or dislocated; to tie the patients down in lithotomy and amputations; to tie upon the veins in phlebotomy, or the arteries in amputations, or in large wounds; to secure the splints that are applied to fractures; to tie up the processes of the peritonæum with the spermatic vessels in castration; and lastly, in taking off warts or other excrescences by ligature.

*LIGHT*, in the most common acceptation of the word, signifies that invisible ethereal matter which makes objects perceptible to our sense of seeing. Figuratively, it is also used for whatever conveys instruction to our minds, and likewise for that instruction itself.

The nature of light hath been a subject of speculation from the earliest ages of philosophy. Some of the first philosophers even doubted whether objects became visible by means of any thing proceeding from them, or from the eye of the spectator. The fallacy of this notion must very soon have been apparent, because, in that case, we ought to have seen as well in the night as in the day. The opinion was therefore qualified by Empedocles and Plato; who maintained, that vision was occasioned by particles continually flying off from the surfaces of bodies which met with others proceeding from the eye; but Pythagoras ascribed it solely to the particles proceeding from the external objects and entering the pupil of the eye.

Among the modern philosophers there have been two celebrated opinions, viz. the Cartesian and Newtonian. According to the former, light is an invisible fluid present at all times and in all places, but which requires to be set in motion by an ignited or otherwise properly qualified body in order to make objects visible to us.—The Newtonians maintain, that light is not a fluid *per se*, but consists of a vast number of exceedingly small particles shaken off in all directions from the luminous body with inconceivable velocity by a repulsive power; and which most probably never return again to the body from which they were emitted. These particles are also said to be emitted in right lines by the body from whence they proceed: and this rectilinear direction they preserve until they are turned out of their original path by the attraction of some other body near which they pass, and which is called *inflection*; by passing through a medium of different density, which is called *refraction*; or by being thrown obliquely or directly forward by some body which opposes their passage, and which is called *reflection*; or, lastly, till they are totally stopped by the substance of any body into which they penetrate, and which is called their *extinction*. A succession of these particles following one another in an exactly straight line is called a *ray of light*; and this ray, in whatever manner it hath its direction changed, whether by refraction, reflection, or inflection, always preserves its recti-

Light.

rectilinear course, neither is it possible by any art whatever to make it pass on in the segment of a circle, ellipse, or other curve.—From some observations on the eclipses of Jupiter's satellites, and also on the aberration of the fixed stars, it appears that the particles of light move at the rate of little less than 200,000 miles in a second of time. See ASTRONOMY, n° 126, 127, 284.

4  
jections  
the New  
plan doc-  
ic.

To this doctrine concerning the nature of light several objections have been made; the most considerable of which is, That in this case, as rays of light are continually passing in different directions from every visible point, they must necessarily interfere with and destroy each other in such a manner as entirely to confound all distinct perception of objects, if not to destroy the sense of seeing altogether; not to mention the continual waste of substance which a constant emission of particles must occasion in the luminous body, and which hence the creation ought to have greatly diminished the sun and stars, as well as increased the bulk of the earth and planets by the vast quantity of particles of light absorbed by them in such a long period of time.

5  
answer by  
Mr Mel-  
ic.

In answer to this objection, Mr Melville gives some ingenious illustrations concerning the extreme subtilty of light, or the smallness of the particles of which it consists, and of which few persons, even of those who admit the hypothesis, have any idea. He observes, that there is probably no physical point in the visible horizon that does not send rays to every other point, unless where opaque bodies interpose. Light, in its passage from one system to another, often passes thro' torrents of light issuing from other suns and systems, without ever interfering or being diverted in its course, either by it, or by the particles of that elastic medium which some phenomena give us reason to suppose are diffused through all the mundane space. To account for this fact and others similar to it, he concludes, that the particles of which light consists must be incomparably rare, even when they are the most dense; that is, that the semidiameters of the two nearest particles, in the same or in different beams, soon after their emission, are incomparably less than their distance from one another. This difficulty concerning the non-interference of the particles of light is not solved, as he observes, by supposing with Mr Boscovich and others, that each particle is endued with an insuperable impulsive force; because, in that case, their spheres of impulsion would even be more liable to interfere, and they would on that account be more likely to disturb one another.

6  
Mr Canton.

The difficulty, according to Mr Canton, will nearly vanish, if a very small portion of time be allowed between the emission of every particle and the next that follows in the same direction. Suppose, for instance, that one lucid point of the sun's surface emits 150 particles in a second, which are more than sufficient to give continual light to the eye without the least appearance of intermission; yet still the particles of which it consists, will on account of their great velocity be more than 1000 miles behind each other, and thereby leave room enough for others to pass in all directions.

7  
experi-  
ments to  
determine  
the mo-  
mentum of  
light.

In order to determine whether light really consisted of particles emitted from the luminous body, or only in the vibrations of a subtle fluid, it hath been attempted to find out its momentum, or the force with which it

moves. The first who set about this matter with any tolerable pretensions to accuracy was M. Mairan. Others indeed, particularly Hartlocker and Homberg, had pretended, that in certain cases this momentum was very perceptible; but M. Mairan proved, that the effects mentioned by them were owing to currents of heated air produced by the burning-glasses used in their experiments, or to some other causes overlooked by the philosophers. To decide the matter therefore, if possible, he began with trying the effects of rays collected by lenses of four and six inches diameter, and thrown upon the needle of a compass; but the result was nothing more than some tremulous motion from whence he could draw no conclusion. After this, he and Mr du Fay constructed a kind of mill of copper, which moved with an exceeding slight impulse; but though they threw upon it the focus of a lens of seven or eight inches diameter, they were still unable to draw any conclusions from the result.

M. Mairan afterwards procured a horizontal wheel of iron three inches in diameter, having six radii, at the extremity of each of which was a small wing fixed obliquely. The axis of the wheel, which was also of iron, was suspended by a magnet. The wheel and the axis together did not weigh more than 30 grains; but though a motion was given to this wheel when the focus of the burning-glass was thrown upon the extremities of the radii, yet it was so irregular that he could not but conclude that it was occasioned by the motion of the heated air. He then intended to have made his experiment *in vacuo*, but he concluded that it was unnecessary. For, besides the difficulty of making a vacuum, he was persuaded that there was in our atmosphere a thinner medium which freely penetrates even glass itself, the existence of which he imagined that he had sufficiently proved in his treatise on the aurora borealis. See AURORA BOREALIS, n° 5.

Mr Michell some years ago endeavoured to ascertain the momentum of light in a manner still more accurate. By Mr Michell. The instrument he made use of for this purpose consisted of a very thin plate of copper, a little more than an inch square, which was fastened to one end of a slender harpichord-wire about ten inches long. To the middle of this was fixed an agate cap, such as is commonly used for small mariner's compasses, after the manner of which it was intended to turn; and at the other end of the wire was a middling sized shot-corn, as a counterpoise to the copper-plate. The instrument had also fixed to it in the middle, at right angles to the length of the wire, and in an horizontal direction, a small bit of a very slender sewing needle, about one third, or perhaps half an inch long, which was made magnetical. In this state the whole instrument might weigh about 10 grains. It was placed on a very sharp pointed needle, on which the agate cap turned extremely freely; and to prevent its being disturbed by any motion of the air, it was included in a box, the lid and front of which were of glass. This box was about 12 inches long, six or seven inches deep, and about as much in width; the needle standing upright in the middle. At the time of making the experiment, the box was placed in such a manner that a line drawn from the sun passed at right angles to the length of it; and the instrument was brought to range in the same direction with the box, by means of the

Light.

By Mr  
Mairan.

By Mr  
Michell.

Light.

magnetical bit of needle abovementioned, and a magnet properly placed on the outside, which would retain it, though with extremely little force, in any situation. The rays of the sun were now thrown upon the copperplate abovementioned from a concave mirror of about two feet diameter, which, passing through the front-glass of the box, were collected into the focus of the mirror upon the copperplate. In consequence of this the plate began to move, with a slow motion of about an inch in a second of time, till it had moved through a space of about two inches and a half, when it struck against the back of the box. The mirror being removed, the instrument returned to its former situation by means of the little needle and magnet; and the rays of the sun being then again thrown upon it, it again began to move, and struck against the back of the box as before; and this was repeated three or four times with the same success.—The instrument was then placed the contrary way in the box to that in which it had been placed before, so that the end to which the copper-plate was affixed, and which had lain, in the former experiment, towards the right hand, now lay towards the left; and the rays of the sun being again thrown upon it, it began to move with a slow motion, and struck against the back of the box as before; and this was repeated once or twice with the same success. But by this time the copperplate began to be so much altered in its form, by the extreme heat which it underwent in each experiment, and which brought it nearly into a state of fusion, that it became very much bent, and the more so as it had been unwarily supported by the middle, half of it lying above and half below the wire to which it was fastened. By this means it now varied so much from the vertical position, that it began to act in the same manner as the sail of a windmill, being impelled by the stream of heated air which moved upwards, with a force sufficient to drive it in opposition to the impulse of the rays of light.

Dr Priestley's conclusions.

“If we impute, (says Dr Priestley), the motion produced in the above experiment to the impulse of the rays of light, and suppose that the instrument weighed ten grains, and acquired a velocity of one inch in a second, we shall find that the quantity of matter contained in the rays falling upon the instrument in that time amounted to no more than one twelve hundred millionth part of a grain, the velocity of light exceeding the velocity of one inch in a second in the proportion of about 12,000,000,000 to 1. Now the light in the above experiment was collected from a surface of about three square feet, which reflecting only about half what falls upon it, the quantity of matter contained in the rays of the sun incident upon a square foot and an half of surface in one second of time, ought to be no more than the twelve hundred millionth part of a grain, or, upon one square foot only, the eighteen hundred millionth part of a grain. But the density of the rays of light at the surface of the sun is greater than at the earth in the proportion of 45,000 to 1: there ought, therefore, to issue from one square foot of the sun's surface in one second of time, in order to supply the waste by light, one forty thousandth part of a grain of matter; that is, a little more than two grains in a day, or about 4,752,000 grains, or 670 pounds avoirdupois nearly, in 6000 years; a quantity

which would have shortened the sun's semidiameter no more than about ten feet, if it was formed of the density of water only.”

The Newtonians, besides the answer just now given to the most formidable objections of their opponents, have endeavoured to prove the impossibility of light being a vibration in any fluid. Sir Isaac, in his *Principia*, demonstrates, that no rectilinear motion can be propagated among the particles of any fluid unless these particles lie in right lines; and he hath also shewn, that all motion propagated through a fluid diverges from a rectilinear progress into the unmoved spaces. Hence he concludes, “a pressure on a fluid medium (i. e. a motion propagated by such a medium beyond any obstacle, which impedes any part of its motion,) cannot be propagated in right lines, but will be always inflecting and diffusing itself every way, to the quiescent medium beyond that obstacle. The power of gravity tends downwards; but the pressure of water rising from it, tends every way with an equable force, and is propagated with equal ease, and equal strength, in curves, as in straight lines. Waves, on the surface of the water, gliding by the extremes of any very large obstacle, inflect and dilate themselves, still diffusing, gradually, into the quiescent water beyond that obstacle. The waves, pulses, or vibrations of the air, wherein sound consists, are manifestly inflected, though not so considerably as the waves of water; and sounds are propagated with equal ease, thro' crooked tubes, and through straight lines; but light was never known to move in any curve, nor to inflect itself *ad unbram*.”

To this Mr Rowing adds another proof. “The Cartesian notion of light, (says he), was not that it is propagated from luminous bodies by the emission of small particles, but that it was communicated to the organ of sight by their pressure upon the materia subtilis, with which they supposed the universe to be full. But, according to this hypothesis, it could never be dark; because, when a fluid sustains any pressure, if that fluid fills all the space it takes up, absolutely, without leaving any pores, which is the case of the supposed materia subtilis, then that pressure must necessarily be communicated *equally and instantaneously* to every part. And therefore, whether the sun were above or below the horizon, the pressure communicated, and consequently the light, would be the same. And farther, as the pressure would be instantaneous, so would the light, which is contrary to what is collected from the eclipses of Jupiter's satellites.”

It is obvious, however, that, whatever side we take concerning the nature of light, many, indeed almost all the circumstances concerning it, are incomprehensible, and beyond the reach of human understanding.

Most of the discous flowers, by some power unknown to us, follow the sun in his course. They attend him to his evening retreat, and meet his rising lustre in the morning with the same unerring law. If a plant also is shut up in a dark room, and a small hole is afterwards opened by which the light of the sun may enter, the plant will turn towards that hole, and even alter its own shape in order to get near it; so that though it was straight before, it will in time become crooked, that it may get near the light. It is not the heat, but the light of the sun, which it thus covets; for, though a fire be kept in the room, capable of giving

Light.

Objections against the Cartesian opinion, by Sir Isaac Newton.

By Mr Rowing.

Unaccountable properties of light.

Light.

a much stronger heat than the sun, the plant will turn away from the fire in order to enjoy the sun's light.—The green colour of plants also depends on the sun's light being allowed to shine upon them; for without this they are always white.—From this last circumstance, and likewise the property which the solar light has of blackening precipitates of silver from the nitrous acid \*, it hath been thought that light either contains the *phlogiston* in very considerable quantity, or is itself a modification of that unknown substance.

See Che-

stry,

1799.

14

not a

modifica-

on of the

phlogiston.

But that this cannot be the case, we have now a proof little short of demonstration, from the last experiments of Dr Priestley concerning the production of pure dephlogisticated air from pump-water, by means of the solar light. If light either were the *phlogiston* itself, or contained it in very considerable quantity, it is impossible the air produced by its means could be pure and dephlogisticated. See the articles *GAS* and *AIR*, in the APPENDIX.—For the properties of light acting as the medium of our perceptions by the sense of sight, see the article *OPTICS*.

*LIGHT independent of Heat.* In general, a very considerable degree of heat is requisite to the emission of light from any body; but there are several exceptions to this, especially in light proceeding from putrescent substances and phosphorus, together with that of luminous animals, and other similar appearances. Light proceeding from putrescent animal and vegetable substances, as well as from glow-worms, is mentioned by Aristotle. Thomas Bartholin mentions four kinds of luminous insects, two with wings, and two without; but in hot climates travellers say they are found in much greater numbers, and of different species. Columna, an industrious naturalist, observes, that their light is not extinguished immediately upon the death of the animal.

The first distinct account that we meet with of light proceeding from putrescent animal-flesh is that which is given by Fabricius ab Aquapendente, who says, that when three Roman youths, residing at Padua, had bought a lamb, and had eaten part of it on Easter-day 1592, several pieces of the remainder, which they kept till the day following, shone like so many candles, when they were casually viewed in the dark. Part of this luminous flesh was immediately sent to Aquapendente, who was professor of anatomy in that city. He observed, that both the lean and the fat of this meat shone with a whitish kind of light, and also took notice, that some pieces of kid's flesh, which had happened to have lain in contact with it, was luminous, as well as the fingers and other parts of the bodies of those persons who touched it. Those parts, he observed, shone the most which were soft to the touch, and seemed to be transparent in candle-light; but where the flesh was thick and solid, or where a bone was near the outside, it did not shine.

After this appearance, we find no account of any other similar to it, before that which was observed by Bartholin, and of which he gives a very pompous description in his ingenious treatise already quoted. This happened at Montpellier in 1641, when a poor old woman had bought a piece of flesh in the market, intending to make use of it the day following. But happening not to be able to sleep well that night, and

Light.

her bed and pantry being in the same room, she observed so much light come from the flesh, as to illuminate all the place where it hung. A part of this luminous flesh was carried as a curiosity to Henry Bourbon, duke of Condé, the governor of the place, who viewed it for several hours with the greatest astonishment.

This light was observed to be whitish; and not to cover the whole surface of the flesh, but certain parts only, as if gems of unequal splendor had been scattered over it. This flesh was kept till it began to putrify, when the light vanished, which, as some religious people fancied, it did in the form of a cross.

It is natural to expect, that the almost universal experimental philosopher Mr Boyle should try the effect of his air-pump upon these luminous substances. Accordingly we find that he did not fail to do it; when he presently found that the light of rotten wood was extinguished *in vacuo*, and revived again on the admission of the air, even after a long continuance *in vacuo*; but the extinguishing of this light was not so complete immediately upon exhausting the receiver, as some little time afterwards. He could not perceive, however, that the light of rotten wood was increased in condensed air; but this, he imagined, might arise from his not being able to judge very well of the degree of light, through so thick and cloudy a glass-vessel as he then made use of; but we find that the light of a shining fish, which was put into a condensing engine before the Royal Society, in 1668, was rendered more vivid by that means. The principal of Mr Boyle's experiments were made in October 1667.

This philosopher attended to a great variety of circumstances relating to this curious phenomenon. Among other things, he observed, that change of air was not necessary to the maintenance of this light; for it continued a long time when a piece of the wood was put into a very small glass hermetically sealed, and it made no difference when this tube which contained the wood was put into an exhausted receiver. This he also observed with respect to a luminous fish, which he put into water, and placed in the same circumstances. He also found, that the light of shining fishes had other properties in common with that of shining wood; but the latter, he says, was presently quenched with water, spirit of wine, a great variety of saline mixtures, and other fluids. Water, however, did not quench all the light of some shining veal, on which he tried it, tho' spirit of wine destroyed its virtue presently.

Mr Boyle's observation of light proceeding from flesh-meat was quite casual. On the 15th of February 1662, one of his servants was greatly alarmed with the shining of some veal, which had been kept a few days, but had no bad smell, and was in a state very proper for use. The servant immediately made his master acquainted with this extraordinary appearance; and though he was then in bed, he ordered it to be immediately brought to him, and he examined it with the greatest attention. Suspecting that the state of the atmosphere had some share in the production of this phenomenon, he takes notice, after describing the appearance, that the wind was south-west

Light. and blustering, the air hot for the season, the moon was past its last quarter, and the mercury in the barometer was at 29½ inches.

16 Light from fishes. Mr Boyle was often disappointed in his experiments on shining-fishes; finding, that they did not always shine in the very same circumstances, as far as he could judge, with others which had shined before. At one time that they failed to shine, according to his expectations, he observed that the weather was variable, and not without some days of frost and snow. In general, he made use of whittings, finding them the fittest for his purpose. In a discourse, however, upon this subject at the Royal Society in 1681, it was asserted, that, of all fishy substances, the eggs of lobsters, after they had been boiled, shone the brightest. Olig. Jacobæus, observes, that, upon opening a sea-polypus, it was so luminous, as to startle several persons who saw it; and he says, that the more putrid the fish was, the more luminous it grew. The nails also and the fingers of the persons who touched it became luminous; and the black liquor which issued from the animal, and which is its bile, shone also, but with a very faint light.

Art. Hæm.  
vol. v.  
P. 282.

Mr Boyle draws a minute comparison between the light of burning coals and that of shining wood or fish, showing in what particulars they agree, and in what they differ. Among other things, he observes, that extreme cold extinguishes the light of shining wood, as appeared when a piece of it was put into a glass tube, and held in a frigorific mixture. He also found that rotten wood did not waste itself by shining, and that the application of a thermometer to it did not discover the least degree of heat.

17 Of the pho-  
las, a re-  
markably  
luminous  
fish. There is a remarkable shell-fish called PHOLAS, which forms for itself holes in various kinds of stone, &c. That this fish is luminous, was noticed by Pliny; who observes, that it shines in the mouth of the person who eats it, and, if it touch his hands or cloaths, makes them luminous. He also says that the light depends upon its moisture. The light of this fish has furnished matter for various observations and experiments to M. Reaumur, and the Bolognian academicians, especially Beccarius, who took so much pains with the subject of phosphoreal light.

M. Reaumur observes, that, whereas other fishes give light when they tend to putrefcence, this is more luminous in proportion to its being fresh; that when they are dried, their light will revive if they be moistened either with fresh or salt water, but that brandy immediately extinguishes it. He endeavoured to make this light permanent, but none of his schemes succeeded.

The attention of the Bolognian academicians was engaged to this subject by M. F. Marilius, in 1724, who brought a number of these fishes, and the stones in which they were inclosed, to Bologna, on purpose for their examination.

Beccarius observed, that though this fish ceased to shine when it became putrid; yet that, in its most putrid state, it would shine, and make the water in which it was immersed luminous, when they were agitated. Galeatus and Montius found, that wine or vinegar extinguished this light: that in common oil it continued some days; but in rectified spirit of wine, or urine, hardly a minute.

Com. Bonon.  
vol. ii. 231.

In order to observe in what manner this light was affected by different degrees of heat, they made use of a Reaumur's thermometer, and found that water rendered luminous by these fishes increased in light till the heat arrived to 45 degrees; but that it then became suddenly extinct, and could not be revived.

In the experiments of Beccarius, a solution of sea-salt increased the light of the luminous water, a solution of nitre did not increase it quite so much. Sal ammoniac diminished it a little, oil of tartar *per deliquium* nearly extinguished it, and the acids entirely. This water poured upon fresh calcined gypsum, rock crystal, ceruss, or sugar, became more luminous. He also tried the effects of it when poured upon various other substances, but there was nothing very remarkable in them. Afterwards, using luminous milk, he found that oil of vitriol extinguished the light, but that oil of tartar increased it.

This gentleman had the curiosity to try how differently coloured substances were affected by this kind of light; and having, for this purpose, dipped several ribbons in it, the white came out the brightest, next to this was the yellow, and then the green; the other colours could hardly be perceived. It was not, however, any particular colour, but only light that was perceived in this case. He then dipped boards painted with the different colours, and also glass tubes, filled with substances of different colours, in water rendered luminous by the fishes. In both these cases the red was hardly visible, the yellow was the brightest, and the violet the dullest. But on the boards the blue was nearly equal to the yellow, and the green more languid; whereas in the glasses, the blue was inferior to the green.

Of all the liquors to which he put the pholades, milk was rendered the most luminous. A single pholas made seven ounces of milk so luminous, that the faces of persons might be distinguished by it, and it looked as if it was transparent.

Air appeared to be necessary to this light; for when Beccarius put the luminous milk into glass tubes, no agitation would make it shine, unless bubbles of air were mixed with it. Also Montius and Galeatus found, that, in an exhausted receiver, the pholas lost its light, but the water was sometimes made more luminous; which they ascribed to the rising of bubbles of air through it.

Beccarius, as well as Reaumur, had many schemes to render the light of these pholades permanent. For this purpose he kneaded the juice into a kind of paste, with flour, and found that it would give light when it was immersed in warm water; but it answered best to preserve the fish in honey. In any other method of preservation, the property of becoming luminous would not continue longer than six months, but in honey it had lasted above a year; and then it would, when plunged in warm water, give as much light as ever it had done.

Similar, in some respects, to those observations on the light of the pholas, was that which was observed to proceed from wood which was moist, but not in a putrid state, which was very conspicuous in the dark.

That the sea is sometimes luminous, especially when it is put in motion by the dashing of oars or the beating

Light.

Art. 5. Cæsa-  
rensis,  
vol. v.  
P. 485.

beating of it against a ship, has been observed with admiration by a great number of persons. Mr Boyle, after recting all the circumstances of this appearance, as far as he could collect them from the accounts of navigators; as its being extended as far as the eye could reach, and at other times being visible only when the water was dashed against some other body; that, in some seas, this phenomenon is accompanied by some particular winds, but not in others; and that sometimes one part of the sea will be luminous, when another part, not far from it, will not be so; concludes with saying, that he could not help suspecting that these odd phenomena, belonging to great masses of water, were in some measure owing to some cosmical law, or custom of the terrestrial globe, or at least of the planetary vortex.

Some curious observations on the shining of some fishes, and the pickle in which they were immerſed, were made by Dr Beal, in May 1665; and had they been properly attended to and purſued, might have led to the diſcovery of the cauſe of this appearance. Having put ſome boiled mackerel into water, together with ſalt and ſweet herbs; when the cook was, ſome time after, ſtirring it, in order to take out ſome of the fiſhes, ſhe obſerved, that, at the firſt motion, the water was very luminous; and that the fiſh ſhining through the water, added much to the light which the water yielded. The water was of itſelf thick and blackiſh, rather than of any other colour; and yet it ſhined on being ſtirred, and at the ſame time the fiſhes appeared more luminous than the water. Where-ever the drops of this water, after it had been ſtirred, fell to the ground, they ſhined; and the children in the family diverted themſelves with taking the drops, which were as broad as a penny, and running with them about the houſe. The cook obſerved, that, when ſhe turned up that ſide of the fiſh that was loweſt, no light came from it; and that, when the water had ſettled for ſome time, it did not ſhine at all. The day following, the water gave but little light, and only after a brisk agitation, though the fiſhes continued to ſhine as well from the inſide as the outſide, and eſpecially about the throat, and ſuch places as ſeemed to have been a little broken in the boiling.

When, in the light of the sun, he examined, with a microscope, a small piece of a fish which had shined very much the night before, he found nothing remarkable on its surface, except that he thought he perceived what he calls a *steam*, rather dark than luminous, arising like a very small dust from the fish, and here and there a very small and almost imperceptible sparkle. Of the sparkles he had no doubt; but he thought it possible that the steam might be a deception of the sight, or some dust in the air.

Finding the fish to be quite dry, he moistened it with his spittle; and then observed that it gave a little light, though but for a short time. The fish at that time was not fetid, nor yet insipid to the best discerning palate. Two of the slishes he kept two or three days longer for farther trial: but, the weather being very hot, they became fetid; and, contrary to his expectations, there was no more light produced either by the agitation of the water, or in the fish.

Father Bourzes, in his voyage to the Indies, in 1704, took particular notice of the luminous appear-

ance of the sea. The light was sometimes so great, that he could easily read the title of a book by it, though he was nine or ten feet from the surface of the water. Sometimes he could easily distinguish, in the wake of the ship, the particles that were luminous from those that were not; and they appeared not to be all of the same figure. Some of them were like points of light, and others such as stars appear to the naked eye. Some of them were like globes, of a line or two in diameter; and others as big as one's head. Sometimes they formed themselves into squares of three or four inches long, and one or two broad. Sometimes all these different figures were visible at the same time; and sometimes there were what he calls *vortices* of light, which at one particular time appeared and disappeared immediately, like flashes of lightning.

Nor did only the wake of the ship produce this light, but fishes also, in swimming, left so luminous a track behind them, that both their size and species might be distinguished by it. When he took some of the water out of the sea, and stirred it ever so little with his hand, in the dark, he always saw in it an infinite number of bright particles; and he had the same appearance whenever he dipped a piece of linen in the sea, and wrung it in a dark place, even though it was half dry; and he observed, that when the sparkles fell upon any thing that was solid, it would continue shining for some hours together.

After mentioning several circumstances which did not contribute to this appearance, this Father observes, that it depends very much upon the *quality of the water*; and he was pretty sure that this light is the greatest when the water is fatest, and fullest of foam. For in the main sea, he says, the water is not everywhere equally pure; and that sometimes, if linen be dipped in the sea, it is clammy when it is drawn up again; and he often observed, that when the wake of the ship was the brightest, the water was the most fat and glutinous, and that linen moistened with it produced a great deal of light, if it was stirred or moved briskly. Besides, in some parts of the sea, he saw a substance like saw-dust, sometimes red, and sometimes yellow; and when he drew up the water in those places, it was always viscous and glutinous. The sailors told him, that it was the spawn of whales; that there are great quantities of it in the North; and that sometimes, in the night, they appeared all over of a bright light, without being put in motion by any vessel or fish passing by them.

As a confirmation of this conjecture, that the more glutinous the sea-water is, the more it is disposed to become luminous, he observes, that one day they took a fish which was called a *bonite*, the inside of the mouth of which was so luminous, that, without any other light, he could read the same characters which he had before read by the light in the wake of the ship; and the mouth of this fish was full of a viscous matter, which, when it was rubbed upon a piece of wood, made it immediately all over luminous; though, when the moisture was dried up, the light was extinguished.

The abbé Nollet was much struck with the luminousness of the sea when he was at Venice in 1749; and, after taking a great deal of pains to ascertain the circumstances of it, concluded that it was occasioned

21  
is con-  
res con-  
rning the  
ufe.

12  
the No!-  
theory.

Light.

by a shining insect; and having examined the water very often, he at length did find a small insect, which he particularly describes, and to which he attributes the light. The same hypothesis had also occurred to M. Vianelli, professor of medicine in Chioggia near Venice; and both he and M. Grizellini, a physician in Venice, have given drawings of the insects from which they imagined this light to proceed.

The abbé was the more confirmed in his hypothesis, by observing, some time after, the motion of some luminous particles in the sea. For, going into the water, and keeping his head just above the surface, he saw them dart from the bottom, which was covered with weeds, to the top, in a manner which he thought very much resembled the motions of insects; though, when he endeavoured to catch them, he only found some luminous spots upon his handkerchief, which were enlarged when he pressed them with his finger.

23  
Observations of M.  
le Roi.

Mémoires  
Présentées,  
vol. iii. 144.

M. le Roi, making a voyage on the Mediterranean, presently after the abbé Nollet made his observations at Venice, took notice, that, in the day-time, the prow of the ship in motion threw up many small particles, which, falling upon the water, rolled upon the surface of the sea for a few seconds, before they mixed with it; and in the night the same particles, as he concluded, had the appearance of fire. Taking a quantity of the water, the same small sparks appeared whenever it was agitated; but, as was observed with respect to Dr Beal's experiments, every successive agitation produced a less effect than the preceding, except after being suffered to rest a while; for then a fresh agitation would make it almost as luminous as the first. This water, he observed, would retain its property of shining by agitation a day or two; but it disappeared immediately on being set on the fire, tho' it was not made to boil.

This gentleman, after giving much attention to this phenomenon, concludes, that it is not occasioned by any shining insects, as the abbé Nollet imagined; especially as, after carefully examining some of the luminous points, which he caught upon an handkerchief, he found them to be round like large pins heads, but with nothing of the appearance of any animal, though he viewed them with a microscope. He also found, that the mixture of a little spirit of wine with water just drawn from the sea, would give the appearance of a great number of little sparks, which would continue visible longer than those in the ocean. All the acids, and various other liquors, produced the same effect, though not quite so conspicuously; but no fresh agitation would make them luminous again. M. le Roi is far from asserting that there are no luminous insects in the sea. He even supposes that the abbé Nollet and M. Vianelli had found them. But he was satisfied that the sea is luminous chiefly on some other account, though he does not so much as advance a conjecture about what it is.

24  
Experiments by  
M. Ant.  
Martin.

Éméd.  
At head.  
vol. xxviii.  
p. 225.

M. Ant. Martin made many experiments on the light of fishes, with a view to discover the cause of the light of the sea. He thought that he had reason to conclude, from a great variety of experiments, that all sea-fishes have this property; but that it is not to be found in any that are produced in fresh water. Nothing depended upon the colour of the fishes, except

Light.

that he thought that the white ones, and especially those that had white scales, were a little more luminous than others. This light, he found, was increased by a small quantity of salt; and also by a small degree of warmth, though a greater degree extinguished it. This agrees with another observation of his, that it depends entirely upon a kind of moisture which they had about them, and which a small degree of heat would expel, when an oiliness remained which did not give this light, but would burn in the fire. Light from the flesh of birds or beasts is not so bright, he says, as that which proceeds from fish. Human bodies, he says, have sometimes emitted light about the time that they began to putrefy, and the walls and roof of a place in which dead bodies had often been exposed, had a kind of dew or clamminess upon it, which was sometimes luminous; and he imagined that the lights which are said to be seen in burying-grounds may be owing to this cause.

From some experiments made by Mr Canton, he By Mr Canton. concludes, that the luminousness of sea-water is owing to the slimy and other putrescent substances it contains. On the evening of the 14th of June 1768, he put a small fresh whitening into a gallon of sea-water, in a pan which was about 14 inches in diameter, and took notice that neither the whitening nor the water, when agitated, gave any light. A Fahrenheit's thermometer, in the cellar where the pan was placed, stood at 54°. The 15th, at night, that part of the fish which was even with the surface of the water was luminous, but the water itself was dark. He drew the end of a stick through it, from one side of the pan to the other; and the water appeared luminous behind the stick all the way, but gave light only where it was disturbed. When all the water was stirred, the whole became luminous, and appeared like milk, giving a considerable degree of light to the sides of the pan; and it continued to do so for some time after it was at rest. The water was most luminous when the fish had been in it about 28 hours; but would not give any light by being stirred, after it had been in it three days.

He then put a gallon of fresh water into one pan, and an equal quantity of sea-water into another, and into each pan he put a fresh herring of about three ounces. The next night the whole surface of the sea-water was luminous, without being stirred; but it was much more so when it was put in motion; and the upper part of the herring, which was considerably below the surface of the water, was also very bright; while at the same time, the fresh water, and the fish that was in it, were quite dark. There were several very bright luminous spots on different parts of the surface of the sea-water; and the whole, when viewed by the light of a candle, seemed covered with a greasy scum. The third night, the light of the sea-water, while at rest, was very little, if at all, less than before; but when stirred, its light was so great as to discover the time by a watch, and the fish in it appeared as a dark substance. After this, its light was evidently decreasing, but was not quite gone before the 7th night. The fresh water and the fish in it were perfectly dark during the whole time. The thermometer was generally above 60°.

The preceding experiments were made with sea-water;

ght. water: but he now made use of other water, into which he put common or sea salt, till he found, by an hydrometer, that it was of the same specific gravity with the sea-water; and, at the same time, in another gallon of water, he dissolved two pounds of salt; and into each of these waters he put a small fresh herring. The next evening the whole surface of the artificial sea-water was luminous without being stirred; but gave much more light when it was disturbed. It appeared exactly like the real sea-water in the preceding experiment; its light lasted about the same time, and went off in the same manner: while the other water, which was almost as salt as it could be made, never gave any light. The herring which was taken out of it the 7th night, and washed from its salt, was found firm and sweet; but the other herring was very soft and putrid, much more so than that which had been kept as long in fresh water. If a herring, in warm weather, be put into 10 gallons of artificial sea-water, instead of one, the water, he says, will still become luminous, but its light will not be so strong.

It appeared by some of the first observations on this subject, that heat extinguishes the light of putrescent substances. Mr Canton also attended to this circumstance; and observes, that though the greatest summer heat is well known to promote putrefaction, yet 20 degrees more than that of the human blood seems to hinder it. For putting a small piece of a luminous fish into a thin glass ball, he found, that water of the heat of 118 degrees would extinguish its light in less than half a minute; but that, on taking it out of the water, it would begin to recover its light in about 10 seconds; but it was never afterwards so bright as before.

Mr Canton made the same observation that Mr Ant. Martin had done, viz. that several kinds of river fish could not be made to give light, in the same circumstances in which any sea-fish became luminous. He says, however, that a piece of carp made the water very luminous, though the outside, or scaly part of it, did not shine at all.

For the sake of those persons who may choose to repeat his experiments, he observes, that artificial sea-water may be made without the use of an hydrometer, by the proportion of four ounces avoirdupois of salt, to seven pints of water, wine-measure.

From undoubted observations, however, it appears, that in many places of the ocean it is covered with luminous insects to a very considerable extent. Mr Dagelet, a French astronomer, who returned from the Terra Australis in the year 1774, brought with him several kinds of worms which shine in water when it is set in motion; and M. Rigaud, in a paper inserted (if we are not mistaken), in the Journal des Sçavans for the month of March 1770, affirms, that the luminous surface of the sea, from the port of Brest to the Antilles, contains an immense quantity of little, round, shining poly-puses of about a quarter of a line in diameter. Other learned men, who acknowledge the existence of these luminous animals, cannot, however, be persuaded to consider them as the cause of all that light and scintillation that appear on the surface of the ocean: they think that some substance of the phosphorus kind, arising

from putrefaction, must be admitted as one of the causes of this phenomenon. M. Godehou has published curious observations on a kind of fish, called in French *bonite*, already mentioned; and though he has observed, and accurately described, several of the luminous insects that are found in sea-water, he is, nevertheless, of opinion, that the scintillation and flaming light of the sea proceed from the oily and greasy substances with which it is impregnated.

The abbe Nollet was long of opinion, that the light of the sea proceeded from electricity (A); though he afterwards seemed inclined to think, that this phenomenon was caused by small animals, either by their luminous aspect, or at least by some liquor or effluvia which they emitted. He did not, however, exclude other causes; among these, the spawn or fry of fish deserves to be noticed. M. Dagelet, sailing into the bay of Antongil, in the island of Madagascar, observed a prodigious quantity of fry, which covered the surface of the sea above a mile in length, and which he at first took for banks of sand on account of their colour; they exhaled a disagreeable odour, and the sea had appeared with uncommon splendour some days before. The same accurate observer, perceiving the sea remarkably luminous in the road of the Cape of Good Hope during a perfect calm, remarked that the oars of the canoes produced a whitish and pearly kind of lustre: when he took in his hand the water which contained phosphorus, he discerned in it, for some minutes, globules of light as large as the heads of pins. When he pressed these globules, they appeared to his touch like a soft and thin pulp; and some days after the sea was covered, near the coasts, with whole banks of these little fish in innumerable multitudes.

To putrefaction, also, some are willing to attribute <sup>27</sup> *Ignis fatuus*. that luminous appearance which goes by the name of *ignis fatuus*, or in common English *Will with a wisp*, to which the credulous vulgar ascribe very extraordinary and especially mischievous powers. This phenomenon is chiefly visible in damp places; and is also said to be very often seen in burying-grounds, and near dunghills. Travellers say, that it is very frequent near Bologna in Italy, and in several parts of Spain and Ethiopia. The form and size of it are very various, and often variable.

It was the opinion of many philosophers, and especially Willoughby and Ray, that the *ignis fatuus* is made by shining insects; but this opinion was never well supported. Sir Isaac Newton calls it a *vapour shining without heat*; and supposes that there is the same difference between this vapour and flame, that there is between wood shining without heat, and burning coals of fire. That this opinion is just, and, moreover, that the light of this vapour shining without heat is of the same nature with light from putrescent substances, according to the supporters of the putrefactive hypothesis, may be concluded from the following circumstances relating to them, as described by Dr Derham and G. B. Beccari.

The former of these gentlemen, having observed an *ignis fatuus* in some boggy ground, between two rocky hills, in a dark and calm night, got by degrees within two or three yards of it, and thereby had an opportunity

(A) This hypothesis was also maintained in a treatise published at Venice in 1746, by an officer in the Austrian service, under the following title, *Dell' Elettricità*.

Light.

tunity of viewing it to the greatest advantage. It kept skipping about a dead thistle, till a slight motion of the air, occasioned, as he supposed, by his near approach to it, made it jump to another place; and as he advanced, it kept flying before him. He was so near to it, that, had it been the shining of glow-worms, he was satisfied that he could not but have distinguished the separate lights of which it must have consisted; whereas it was one uniform body of light. He therefore thought that it must be an ignited vapour (s).

M. Beccari made it his business to inquire concerning this phenomenon of all his acquaintance who had opportunities of observing it, either on the mountains, or on the plain. He found, that two which appeared on the plains, one to the north and the other to the east of Bologna, were to be seen almost every dark night, especially the latter; and the light they gave was equal to that of an ordinary faggot. That to the east of Bologna once appeared to a gentleman of his acquaintance as he was travelling, and kept him company above a mile, constantly moving before him, and casting a stronger light upon the road than the torch which was carried along with him. All these luminous appearances, he says, gave light enough to make all neighbouring objects visible; and they are always observed to be in motion, but this motion was various and uncertain. Sometimes they would rise up, and at other times sink; but they commonly kept hovering about six feet from the ground. They would also disappear of a sudden, and instantly appear again in some other place. They differed both in size and figure; sometimes spreading pretty wide, and then again contracting themselves; sometimes breaking into two, and then joining again; sometimes floating like waves, and dropping, as it were, sparks of fire. He was assured that there was not a dark night all the year round in which they did not appear, and that they were observed more frequently when the ground was covered with snow, than in the hottest summer: nor did rain or snow in the least hinder their appearance; but, on the contrary, they were observed more frequently, and cast a stronger light, in rainy and wet weather; nor were they much affected by the wind.

The grounds to the east of Bologna, where the largest of these appearances was seen, is, he says, a hard chalky and clayey soil, which will retain the water a long time, and afterwards, in hot weather, would break into large cracks; but on the mountains, where the *ignis fatui* were smaller, the soil was of a loose sandy texture, which would not keep the water very long. According to the best information he could procure, these lights very much frequent brooks and rivers, being often observed on the banks of them; particularly, says he, because the current of air carries them thither more readily than to any other place.

This gentleman concludes his account of these appearances with the following curious narrative. An intelligent gentleman travelling in March, between eight and nine in the evening, in a mountainous road about ten miles south of Bologna, perceived a light which shone very strongly upon some stones that lay on the banks of the river Rivoerde. It seemed to be about

two feet above the stones, and not far from the water. In size and figure it had the appearance of a paralleloiped, somewhat more than a foot in length, and half a foot high, the longest side being parallel to the horizon. Its light was so strong, that he could plainly distinguish by it part of a neighbouring hedge and the water of the river; only in the east corner of it the light was rather faint, and the square figure less perfect, as if it was cut off or darkened by the segment of a circle.

His curiosity tempting him to examine this appearance a little nearer, he advanced gently towards the place; but was surprised to find that it changed gradually from a bright red, first to a yellowish, and then to a pale colour, in proportion as he drew nearer; and when he came to the place itself, it quite vanished. Upon this he stepped back, and not only saw it again, but found that the farther he went from it, the stronger and brighter it grew. When he examined the place of this luminous appearance, he could not perceive the least smell, or any other mark of fire.

This extraordinary account was confirmed to M. Beccari by another gentleman who frequently travelled the same road, and who assured him that he had seen the very same light five or six different times, in spring and autumn, and that he had always observed it to be of the very same shape, and in the same place; and he once took particular notice of its coming out of a neighbouring place, and settling itself in the figure above described.

M. Beccari owns himself to be greatly at a loss to account not only for this very remarkable appearance, but also for the *ignis fatui* in general. He only says, that all persons who ever saw any of these appearances, agree, that they cast a light quite different from that of shining fires.

Dr Shaw describes an *ignis fatuus* which he saw in the Holy Land; the circumstances of which are so remarkable, that they well deserve to be recited, especially as some of them seem to point at the cause of the phenomenon. As he and his company were travelling by night through the valleys of Mount Ephraim, they were attended more than an hour by an *ignis fatuus*, which was sometimes globular, or in the form of the flame of a candle; and which would immediately afterwards spread itself so much as to involve the whole company in a pale inoffensive light, and then contract itself again, and suddenly disappear. But in less than a minute it would become visible as before; or, running along from one place to another, with a swift progressive motion, would expand itself at certain intervals, over more than two or three acres of the adjacent mountains. The atmosphere from the beginning of the evening had been remarkably thick and hazy, and the dew, as they felt it upon their bridles, was unusually clammy and unctuous. In the same kind of weather, he says, he has observed those luminous appearances, which at sea skip about the masts and yards of ships, and which the sailors call *corpufante*, which is a corruption of the Spanish *Cuerpo fante*.

A light in some respects similar to those abovementioned has been found to proceed from that celebrated light.

(s) Similar in some respects to this light, was one that surrounded the body and the bed of a woman at Milan, which flid from the hand that approached it, but was at length dispersed by the agitation of the air. *Atta Casarieria*, Vol. III. p. 11.

Light.

chemical production called *phosphorus*, which always tends to decompose itself, so as to take fire by the access of air only. Phosphorus, therefore, when it emits light, is properly a body ignited; though when a very small quantity of it is used, as what is left after drawing it over paper, or what may be dissolved in essential oil, the heat is not sensible. But perhaps the matter which emits the light in what we call *putrescent substances* may be similar to it, though it be generated by a different process, and burn with a less degree of heat. Putrescence does not seem to be necessary to the light of glow-worms, or of the pholades; and yet their light is sufficiently similar to that of shining wood or flesh. Electric light is unquestionably similar to that of phosphorus, though the source of it is apparently very different.

Kunkel formed his phosphorus into a kind of pills about the size of peas, which being moistened a little, and scraped in the dark, yielded a very considerable light, but not without smoke. The light was much more pleasing when eight or ten of these pills were put into a glass of water; for being shaken in the dark, the whole glass seemed to be filled with light. Kunkel also reduced his phosphorus into the form of larger stones, which being warmed by a person's hand, and rubbed upon paper, would describe letters that were very legible in the dark.

The greatest variety of experiments with the light of phosphorus was made by Dr Slare; who says, that the liquid phosphorus (which is nothing more than the solid phosphorus dissolved in any of the essential oils) would not hurt even a lady's hand; or that, when the hands or face were washed with it, it would not only make them visible to other persons in the dark, but that the light was so considerable as to make other neighbouring objects visible.

When the solid phosphorus is quite immersed in water, he observes that it ceases to shine; but that if any part of it chance to emerge, or get into the air, it will shine though the glass be hermetically sealed. In a large glass he kept it without water for several days; and yet it continued shining, with very little diminution of its light or weight. If the letters that were written with this phosphorus were warmed by the fire, they presently became dark lines, which continued upon the paper, like ink. To try how much light was given by a small quantity of this phosphorus, he observed that it continued to flame in the open air for seven or eight days; the light being visible whenever he shut his window.

As air was generally thought to contain the *pabulum* of flame, Dr Slare was determined to try this with respect to phosphorus; and for this purpose he placed a large piece of it in a receiver; but upon exhausting it, he perceived that it became more luminous, and that, upon admitting the air, it returned to its former state. This property of the light of phosphorus, which is the very reverse of that of shining wood and fishes, was also ascertained by several very accurate experiments of Mr Haukbee's.

Endeavouring to blow the phosphorus into a flame with a pair of bellows, Dr Slare found that it was presently blown out, and that it was a considerable time before the light revived again. All liquors would extinguish this light when the phosphorus was put into

VOL. VI.

them; nor would it shine or burn, though it was even boiled in the most inflammable liquors, as oil of olives, spirit of turpentine, or even spirit of wine.

In order to keep his phosphorus from consuming, he used to put it in a glass of water; and sometimes he has seen it, when thus immersed in water, make such bright and vigorous coruscations in the air, as, he says, would surprise and frighten those who are not used to the phenomenon. This fiery meteor, he says, is contracted in its passage through the water, but expands as soon as it gets above it. If any person would make this experiment to advantage, he informs them that the glass must be deep and cylindrical, and not above three quarters filled with water. This effect he perceived in warm weather only, and never in cold.

The phosphorus of which we have been treating is prepared from urine; but in some cases the sweat, which is similar to urine, has been observed to be phosphoreous, without any preparation. This once happened to a person who used to eat great quantities of salt, and who was a little subject to the gout, after sweating with violent exercise. Stripping himself in the dark, his shirt seemed to be all on fire, which surprised him very much. Upon examination, red spots were found upon his shirt; and the physician who was present perceived an urinous smell, though it had nothing in it of volatile alkali, but of the muriatic acid; the same, he says, that issues from cabbage much salted, and strongly fermenting.

The easiest method of accounting for all these kinds of lights, perhaps, is from electricity. If light consists in a certain vibration of the electric fluid, then it follows, that in whatever substance such a vibration takes place, there light must appear, whether in putrescent animal-substances, sea-water, phosphorus, or any thing else. We know that the electric matter pervades all terrestrial substances, and is very liable to be set in motion from causes of which we are ignorant. The action of the air by which putrefaction is produced may be one of these causes; and it can by no means appear surprising that the electric matter should act in the bodies of living animals in such a manner as to produce a permanent light, when we certainly know it acts in some of them so powerfully as to produce a shock similar to that of a charged vial.—On this subject we shall only observe farther, that when this vibration becomes so powerful as to penetrate the solid substance of the body itself, the luminous body then becomes transparent, as in the milk abovementioned; but, when it is only superficial, the body, though it emits light, is itself opaque.

**LIGHT-HOUSES**, in maritime affairs, a building on the sea-shore, a promontory, a rock, &c. wherein is kept a light during the night in order to direct vessels sailing near the place.

**LIGHT-ROOMS**, a small apartment, inclosed with glass-windows, near the magazine of a ship of war. It is used to contain the lights by which the gunner and his assistants are enabled to fill cartridges with powder to be ready for action.

**LIGHTER**, a large, open, flat-bottomed vessel, generally managed with oars, and employed to carry goods to or from a ship when she is to be laden or delivered.—There are also some lighters furnished with a deck throughout their whole length, in order to contain

Lightning. tain those merchandizes which would be damaged by rainy weather: these are usually called *close lighters*.

LIGHTNING, a bright and vivid flash of fire, suddenly appearing in the atmosphere, and commonly disappearing in an instant, sometimes attended with clouds and thunder, and sometimes not.

1 Different appearances of lightning. The phenomena of lightning are always surprising, and sometimes very terrible; neither is there any kind of natural appearance in which there is more diversity, not two flashes being ever observed exactly similar to one another. In a serene sky, the lightning, in this country at least, almost always hath a kind of indistinct appearance without any determinate form, like the sudden illumination of the atmosphere occasioned by firing a quantity of loose gunpowder; but when accompanied with thunder, it is well defined, and hath very often a zig-zag form. Sometimes it makes only one angle, like the letter V, sometimes it hath several branches, and sometimes it appears like the arch of a circle. But the most formidable and destructive form which lightning is ever known to assume is that of balls of fire. The motion of these is very often easily perceptible to the eye; but wherever they fall, much mischief is occasioned by their bursting, which they always do with a sudden explosion, like that of fire-arms. Sometimes they will quietly run along, or rest for a little upon any thing, and then break into several pieces, each of which will explode; or the whole ball will burst at once, and produce its mischievous effects only in one place. The next to this in its destructive effects is the zig-zag kind; for that which appears like indistinct flashes, whose form cannot be readily observed, is seldom or never known to do hurt.—The colour of the lightning also indicates in some measure its power to do mischief; the palest and brightest flashes being most destructive; such as are red or of a darker colour, commonly doing less damage.

2 Its seeming omnipresence. A very surprising property of lightning, the zig-zag kind especially, when near, is its seeming omnipresence. If two persons are standing in a room looking different ways, and a loud clap of thunder accompanied with zig-zag lightning happens, they will both distinctly see the flash, not only by that indistinct illumination of the atmosphere which is occasioned by fire of any kind; but the very form of the lightning itself, and every angle it makes in its course, will be as distinctly perceptible, as though they had looked directly at the cloud from whence it proceeded. If a person happened at that time to be looking on a book, or other object which he held in his hand, he would distinctly see the form of the lightning between him and the object at which he looked. This property seems peculiar to lightning, and to belong to no other kind of fire whatever.

3 Remarkable effects of lightning. The effects of lightning are generally confined within a small space; and are seldom similar to those which accompany explosions of gun-powder, or of inflammable air in mines. Instances of this kind, however, have occurred; the following is one of the most remarkable of which we have any distinct account. "August 2d 1763, about six in the evening, there arose at Anderlecht, about a league from Brussels, a conflict of several winds borne upon a thick fog. This conflict lasted four or five minutes, and was attended

with a frightful hissing noise, which could be compared to nothing but the yellings of an infinite number of wild beasts. The cloud then opening, discovered a kind of very bright lightning, and in an instant the roofs of one side of the houses were carried off and dispersed at a distance; above 1000 large trees were broke off, some near the ground, others near the top, some torn up by the roots; and many both of the branches and tops carried to the distance of 60, 100, or 120 paces; whole coppices were laid on one side, as corn is by ordinary winds. The glass of the windows which was most exposed was shivered to pieces. A tent in a gentleman's garden was carried to the distance of 4000 paces; and a branch torn from a large tree, struck a girl in the forehead as she was coming into town, at the distance of 40 paces from the trunk of the tree, and killed her on the spot."

These terrible effects seem to have been owing to the prodigious agitation in the air, occasioned by the emission of such a vast quantity of lightning at once; or perhaps to the agitation of the electric fluid itself, which is still more dangerous than any concussion of the atmosphere; for thunder-storms will sometimes produce most violent whirlwinds, such as are by the best philosophers attributed to electricity, nay, even occasion an agitation of the waters of the ocean itself, and all this too after the thunder and lightning have ceased.—Of this we have the following instances.

"Great Malvern, October 16th 1761. On Wednesday last, we had the most violent thunder ever known in the memory of man. At a quarter past four in the afternoon, I was surprised with a most shocking and dismal noise; 100 forges (the nearest resemblance I can think of,) were they all at work at once, could scarce equal it. I ran to the fore-door, and casting my eye upon the side of the hill about 400 yards to the south-west of my house, there appeared a prodigious smoky, attended with the same violent noise. I ran back into the house, and cried out, a volcano (for so I thought) had burst out of the hill; but I had no sooner got back again, than I found it had descended, and was passing on within about 100 yards of the south end of my house. It seemed to rise again in the meadow just below it; and continued its progress to the east, rising in the same manner for four different times, attended with the same dismal noise as at first; the air being filled with a nauseous and sulphureous smell. I saw it gradually decrease till quite extinguished in a turnep-field about a quarter of a mile below my house. The turnip-leaves, with leaves of trees, dirt, sticks, &c. filled the air, and flew higher than any of these hills. The thunder ceased before this happened, and the air soon afterwards became calm and serene."—The vast column of smoke mentioned in the above letter was so large, that a physician of eminence at Worcester saw it in its progress down the hill, about a mile from Feckenham, which is above 20 miles from Malvern.—In August 1763, a most violent storm of thunder, rain, and hail, happened at London, which did damage in the adjacent country, to the amount of 50,000 l. Hailstones fell of an immense size, from two to ten inches circumference; but the most surprising circumstance was the sudden flux and reflux of the tide in Plymouth pool, exactly corresponding with the like agi-

agitation in the same place, at the time of the great earthquake at Lisbon.

Instances are also to be found, where lightning, by its own proper force, without any assistance from those less common agitations of the atmosphere or electric fluid, hath thrown stones of immense weight to considerable distances; torn up trees by the root, and broke them in pieces; shattered rocks; beat down houses, and set them on fire, &c. All these, however, are to be considered as the more unusual phenomena of lightning; its common mode of action being entirely similar to that of a charged Leyden vial, where the electric matter discharges itself from a substance positively electrified to one that is negatively so. The identity of electric matter and lightning seems now, indeed, so well established, that there is not the least foundation for seeking any other solution of the phenomena of lightning, than what may be obtained by comparing them with those of our electrical experiments. The different forms of the flashes are all exemplified in those of electrical sparks. Where the quantity of electricity is small, and consequently incapable of striking at any considerable distance, the spark appears straight, without any curvature or angular appearance; but where the electricity is very strong, and of consequence capable of striking an object at a pretty considerable distance, it assumes a crooked or zig-zag form. This is always the case with Mr Nairn's very powerful machines, the conductors of which are six feet in length and one foot in diameter. Sparks may be taken from them at the distance of 16, 17, or even 20 inches; and all of these put on the angular zig-zag form of lightning. The reason of this appearance, both in these sparks and in the lightning, is, that the more fluid electric matter hath to pass through the denser and less fluid atmosphere with great rapidity; and in fact, this is the way in which all the more fluid substances pass through those that are less so, at least when their velocity becomes considerable.—If bubbles of air or steam pass very gently up through water, their course from the bottom to the top of the vessel will differ very little, if at all, from a straight line; but when they are impelled by a considerable force, as in air blown from a bellows, or the bubbles of steam which arise in boiling water, their course is then marked by waved and crooked lines, and the deflection of the bubbles to the right or left, will be precisely in proportion to their ascending velocity, and to the weight of the water by which they are resisted.

In the case of air blown through water, however, or steam ascending from the bottom of a vessel of boiling water, though the course of the bubbles is waved and crooked, we never observe it to be angular as in lightning. The reason of this is, that there is no proportion between the capacity of the air for yielding to the impetus of lightning, and the velocity with which the latter is moved. From Mr Robins's experiments in gunnery, it appears, that the air cannot yield with a velocity much greater than 1200 feet in a second, and that all projectiles moving with a greater degree of velocity meet with a violent resistance. But if we suppose lightning to move only with one half the velocity of light, that is, near 100,000 miles in a second, its motion in the fluid at-

mosphere will meet with a resistance very little inferior to what air would meet with in passing through the most solid bodies. The smallest difference of the resistance of the atmosphere on either side, must determine the lightning to that side; and in its passage to that new place where the resistance is least, it multiplies on in a straight line, making an angle with its former course, because the atmosphere is altogether incapable of yielding with such rapidity as the electric matter requires, and therefore resists like a solid rock. The case is otherwise in the former examples: for tho' a small difference in the resistance forces the bubbles of air or steam to deviate from side to side, yet there is always a considerable proportion between the capacity of water for yielding, and that force by which the bubbles urge it to yield; so that though it does make a resistance sufficient to prevent the bubbles from moving in a straight line, yet it also perceptibly yields at all times, and therefore the tract of the bubbles is formed by a number of curves and not angles.

Hence we may understand the reason why the zig-zag kind of lightning is so dangerous, namely, because it must overcome a very violent resistance of the atmosphere; and wherever that resistance is in the smallest degree lessened, there it will undoubtedly strike, and at a very considerable distance too. It is otherwise with that kind which appears in flashes of no determinate form. The electric matter of which these are composed, is evidently dissipated in the air by some conducting substances which are present there; and of consequence, though a man, or other conducting body, happened to be very near such a flash, he would not be struck or materially injured by it, tho' a zig-zag flash, in such circumstances, would have probably discharged its whole force upon him.

The most destructive kind of lightning, however, as we have already observed, is that which assumes the form of balls. These are produced by an exceeding great power of electricity gradually accumulated till the resistance of the atmosphere is no longer able to confine it. In general, the lightning breaks out from the electrified cloud by means of the approach of some conducting substance; either a cloud, or some terrestrial substance: but the fire-balls seem to be formed, not because there is any substance at hand to attract the electric matter from the cloud, but because the electricity is accumulated in such quantity that the cloud itself can no longer contain it. Hence such balls fly off slowly, and have no particular destination. Their appearance indicates a prodigious commotion and accumulation of electricity in the atmosphere, without a proportionable disposition in the earth to receive it. This disposition, however, we know is perpetually altered by a thousand circumstances, and the place which first becomes most capable of admitting electricity will certainly receive a fire-ball. Hence this kind of lightning has been known to move slowly backwards and forwards in the air for a considerable space of time, and then suddenly to fall on one or more houses, according to their being more or less affected with an electricity opposite to that of the ball at the time. It will also run along the ground, break into several parts, and produce several explosions at the same time.

It is very difficult to imitate lightning of this kind in our electrical experiments. The only cases in which

Lightning. it hath been done in any degree are those in which Dr Priestley made the explosion of a battery pass for a considerable way over the surface of raw flesh, water, &c. In these cases, if, while the electric flash passed over the surface of the flesh, it had been possible to interrupt the metallic circuit by taking away the chain, the electric matter discharged from the battery would have been precisely in the situation of one of the fire-balls above-mentioned; i. e. it would have been at a loss for a conductor. The negative side of the battery was the place of its destination; but to that it would not have easily got, because of the great quantity of atmosphere which lay in its way, and the incapacity of the neighbouring bodies to receive it. But if, while the electric matter was thus stationary for want of a conductor, if any person standing near, or touching the negative side of the battery, presented a finger to that seemingly inoffensive luminous body, he would instantly be struck very violently; because a free communication being now made by means of his body, the powers by which the electric fluid is impelled from one place to another would instantly urge it upon him. But if we suppose a person, who hath no communication with the battery, to present his finger to the same body, he may perhaps receive a slight spark from it; but not a shock of any consequence, because there is not a perfect communication by means of his body with the place to which the electric fire is destined.

Phenomena of lightning in general accounted for. Hence we may account for the seemingly capricious nature of lightning of all kinds, but especially of that kind which appears in the form of balls. Sometimes it will strike trees, high houses, steeples, and towers, without touching cottages, men, or other animals, who are in the neighbourhood. In such cases, people would be apt to say that the neighbourhood of these higher objects *preferred* the others from the stroke; but with little reason, since low houses, men walking in the fields, cattle, nay, the surface of the earth itself, have all been struck, while high trees and steeples in the neighbourhood have not been touched. In like manner, fire-balls have passed very near certain persons without hurting them, while they have, as it were, gone considerably out of their way to kill others. The reason of all this is, that in thunder-storms there is constantly a certain zone of earth considerably under the surface, which the lightning desires (if we may use the expression) to strike, because it hath an electricity opposite to that of the lightning itself. Those objects, therefore, which form the most perfect conductors between the electrified clouds and that zone of earth, will be struck by the lightning, whether they are high or low; and because we know not the conducting quality of the different terrestrial substances, the superstitious are apt to ascribe strokes of lightning to the Divine vengeance against particular persons, whereas it is certain that this fluid, as well as others, acts according to invariable rules from which it is never known to depart.

Lightning, in the time of severe thunder-storms, is supposed to proceed from the earth, as well as from the clouds: but this fact hath never been well ascertained, and indeed from the nature of the thing it seems very difficult to be ascertained; for the motion of the electric fluid is so very quick, that it is altogether

impossible to determine, by means of our senses, whether it goes from the earth or comes to it. In fact, there are in this country many thunder-storms in which it doth not appear that the lightning touches any part of the earth, and consequently can neither go to it nor come out from it. In these cases, it flashes either from an electrified cloud to one endowed with an opposite electricity, or merely into those parts of the atmosphere which are ready to receive it. But if not only the clouds, but the atmosphere all the way betwixt them and the earth, and likewise for a considerable space above the clouds, are electrified one way, the earth must then be struck. The reason of this will appear from a consideration of the principles laid down under the article ELECTRICITY, sect. vi. It there appears, that the electric fluid is altogether incapable either of *accumulation* or *diminution* in quantity in any particular part of space. What we call electricity is only the motion of this fluid made perceptible to our senses. Positive electricity is when the current of electric matter is directed from the electrified body. Negative electricity is when the current is directed towards it. Let us now suppose, that a positively electrified cloud is formed over a certain part of the earth's surface. The electric matter flows out from it first into the atmosphere all round; and while it is doing so, the atmosphere is negatively electrified. In proportion, however, as the electric current pervades greater and greater portions of the atmospheric space, the greater is the resistance to its motion, till at last the air becomes positively electrified as well as the cloud, and then both act together as one body. The surface of the earth then begins to be affected, and it silently receives the electric matter by means of the trees, grass, &c. which grow upon its surface, till at last it becomes positively electrified also, and begins to send off a current of electricity from the surface downwards. The causes which at first produced the electricity of the clouds, (and which are treated of under the article THUNDER), still continuing to act, the power of the electric current becomes inconceivably great. The danger of the lightning is directed to some place below the surface of the earth, it will certainly dart towards that place, and shatter every thing to pieces which resists its passage. The benefit of conducting-rods will now also be evident: for we are sure that the electric matter will in all cases take the way where it meets with the least resistance; and this is through the substance, or rather over the surface, of metals. In such a case, therefore, if there happen to be a house furnished with a conductor directly below the cloud, and at the same time a zone of negatively electrified earth not very far below the foundation of the house, the conductor will almost certainly be struck, but the building will be unhurt. If the house wants a conductor, the lightning will nevertheless strike in the same place, in order to get at the negatively electrified zone above-mentioned; but the building will now be damaged, because the materials of it cannot readily conduct the electric fluid.

We will now be able to enter into the dispute, Whether the preference is due to knobbed or pointed conductors for preserving buildings from strokes of lightning. Ever since the discovery of the identity of the electricity table.

lightning, electricity and lightning, it hath been allowed by all parties, that conductors of some kind are in a manner essentially necessary for the safety of buildings in those countries where thunder-storms are very frequent. The principle on which they act hath been already explained; namely, that the electric fluid, when impelled by any power, always goes to that place where it meets with the least resistance, as all other fluids also do. As metals, therefore, are found to give the least resistance to its passage, it will always choose to run along a metalline rod, in preference to a passage of any other kind. We must, however, carefully consider a circumstance which seems to have been too much overlooked by electricians in their reasonings concerning the effects of thunder-rods; namely, That lightning, or electricity, never strikes a body, merely for the sake of the body itself, but only because by means of that body it can readily arrive at the place of its destination. When a quantity of electricity is collected from the earth, by means of an electric machine, a body communicating with the earth will receive a strong spark from the prime conductor. The body receives this spark, not because it is itself capable of containing all the electricity of the conductor and cylinder, but because the natural situation of the fluid being disturbed by the motion of the machine, a stream of it is sent off from the earth. The natural powers, therefore, make an effort to supply what is thus drained off from the earth; and as the individual quantity which comes out is most proper for supplying the deficiency, as not being employed in any natural purpose, there is always an effort made for returning it to the earth. No sooner, then, is a conducting body, communicating with the earth, presented to the electrical machine, than the whole effort of the electricity is directed against that body, not merely because it is a conductor, but because it leads to the place where the fluid is directed by the natural powers by which it is governed, and at which it would find other means to arrive, though that body were not to be presented. That this is the case, we may very easily satisfy ourselves, by presenting the very same conducting substance in an insulated state to the prime conductor of the machine; for then we shall find, that only a very small spark will be produced. In like manner, when lightning strikes a tree, a house, or a thunder-rod, it is not because these objects are high, or in the neighbourhood of the cloud; but because they communicate with some place below the surface of the ground, against which the impetus of the lightning is directed; and at that place the lightning would certainly arrive, though none of the above-mentioned objects had been interposed.

The fallacy of that kind of reasoning generally employed concerning the use of thunder-rods, now lies sufficiently apparent. Because a point presented to an electrified body in our experiments, always draws off the electricity in a silent manner; therefore Dr Franklin and his followers have concluded, that a pointed conductor will do the same thing to a thunder-cloud, and thus effectually prevent any kind of danger from a stroke of lightning. Their reasoning on this subject, they think, is confirmed by the following fact among many others. " Dr Franklin's house at Philadelphia was furnished with a rod extending nine feet above the

top of the chimney. To this rod was connected a Lightning-wire of the thickness of a goose-quill, which descended through the well of the stair-case; where an interruption was made, so that the ends of the wire, to each of which a little bell was fixed, were distant from each other about six inches; an insulated brass ball hanging between the two bells. The author was one night waked by loud cracks, proceeding from his apparatus in the stair-case. He perceived, that the brass ball, instead of vibrating as usual between the bells, was repelled and kept at a distance from both; while the fire sometimes passed in very large quick cracks directly from bell to bell; and sometimes in a continued dense white stream, seemingly as large as his finger; by means of which the whole stair-case was enlightened, as with sun-shine, so that he could see to pick up a pin.—From the apparent quantity of electric matter of which the cloud was thus evidently robbed, by means of the pointed rod (and of which a blunt conductor would not have deprived it), the author conceives, that a number of such conductors must considerably lessen the quantity of electric fluid contained in any approaching cloud, before it comes so near as to deliver its contents in a general stroke."

For this very reason, Mr Benjamin Wilson and his followers, who constitute the opposite party, have determined that the use of pointed conductors is utterly unsafe. They say, that in violent thunder-storms the whole atmosphere is full of electricity; and that attempts to exhaust the vast quantity there collected, are like attempting to clear away an inundation with a shovel, or to exhaust the atmosphere with a pair of bellows. They maintain, that though pointed bodies will effectually prevent the accumulation of electricity in any substance; yet if a non-electrified body is interposed between a point and the conductor of an electrical machine, the point will be struck at the same moment with the non-electrified body, and at a much greater distance than that at which a knob would be struck. They affirm also, that, by means of this silent sollicitation of the lightning, inflammable bodies, such as gun-powder, tinder, and Kunckel's phosphorus, may be set on fire; and for these last facts they bring decisive experiments. From all this, say they, it is evident that the use of pointed conductors is unsafe. They solicit a discharge to the place where they are; and as they are unable to conduct the whole electricity in the atmosphere, it is impossible for us to know whether the discharge they solicit may not be too great for our conductor to bear; and consequently all the mischiefs arising from thunder-storms may be expected, with this additional and mortifying circumstance, that this very conductor hath probably solicited the fatal stroke, when without it the cloud might have passed harmless over our heads without striking at all.

Here the reasoning of both parties is equally wrong. They both proceed on this erroneous principle, that in thunder-storms the conductor will always solicit a discharge, or that at such times all the elevated objects on the surface of the earth are drawing off the electricity of the atmosphere: but this cannot be the case, unless the electricity of the earth and of the atmosphere is of a different kind. Now, it is demonstrable, that until this difference between the electricity of the atmosphere and of the surface of the earth ceases, there cannot

Lightning cannot be a thunder-form. When the atmosphere begins to be electrified either positively or negatively, the earth, by means of the inequalities and moisture of its surface, but especially by the vegetables which grow upon it, absorbs that electricity, and quickly becomes electrified in the same manner with the atmosphere. This absorption, however, ceases in a very short time, because it cannot be continued without setting in motion the whole of the electric matter contained in the earth itself. Alternate zones of positive and negative electricity will then begin to take place below the surface of the earth, for the reasons mentioned under the article ELECTRICITY, sect. vi. § 9. Between the atmosphere and one of these zones, the stroke of the lightning always will be. Thus, supposing the atmosphere is positively electrified, the surface of the earth will, by means of trees, &c. quickly become positively electrified also; we shall suppose to the depth of 10 feet. The electricity cannot penetrate farther on account of the resistance of the electric matter in the bowels of the earth. At the depth of 10 feet from the surface, therefore, a zone of negatively-electrified earth begins, and to this zone the electricity of the atmosphere is attracted; but to this it cannot get, without breaking through the positively-electrified zone which lies uppermost, and shattering to pieces every bad conductor which comes in its way. We are very sure, therefore, that in whatever places the outer-zone of positively-electrified earth is thinnest, there the lightning will strike whether a conductor happens to be present or not. If there is a conductor, either knobbed or sharp-pointed, the lightning will indeed infallibly strike it: but it would also have struck a house situated on that spot without any conductor; and though the house had not been there, it would have struck the surface of the ground itself.—Again, if we suppose the house with its conductor to stand on a part of the ground where the positively-electrified zone is very thick, the conductor will neither silently draw off the electricity, nor will the lightning strike it, though perhaps it may strike a much lower object, or even the surface of the ground itself, at no great distance; the reason of which undoubtedly is, that there the zone of positively-electrified earth is thinner, than where the conductor was.

We must also observe, that the Franklinians make their pointed conductors to be of too great consequence. To the houses on which they are fixed, no doubt, their importance is very great: but in exhausting a thunder-cloud of its electricity, their use must appear trifling; and to insist on it, ridiculous. Innumerable objects, as trees, grass, &c. are all conspiring to draw off the electricity, as well as the conductor, if it could be drawn off; but of effecting this there is an impossibility, because they have the same kind of electricity with the clouds themselves. The conductor hath not even the power of *attracting* the lightning a few feet out of the direction which it would choose of itself. Of this we have a most remarkable and decisive instance, in what happened to the magazine at Purfleet in Essex, on May 15, 1777. That house was furnished with a pointed conductor, raised above the highest part of the building; nevertheless, about six in the evening of the abovementioned day, a flash of lightning struck an iron cramp in the corner of the wall, considerably

lower than the top of the conductor, and only 46 feet Lightning in a sloping line distant from the point.—This produced a long dispute with Mr Wilson concerning the propriety of using pointed conductors; and, by the favour of his majesty, he was enabled to construct a more magnificent electrical apparatus than any private person could be supposed to erect at his own expence, and of which some account is given under the article ELECTRICITY, n<sup>o</sup> 78. The only new experiments, however, which this apparatus produced, were, the firing of gunpowder by the electric *aura*, as it is called; and a particularly violent shock which a person received when he held a small pointed wire in his hand, upon which the conductor was discharged. We must observe, that the electrified surface of the conductor was 620 feet; and we can have but little idea of the strength of sparks from a conductor of this magnitude, supposing it properly electrified. Six turns of the wheel made the discharge felt through the whole body like the strong shock of a Leyden vial; and nobody chose to make the experiment when the conductor had received a higher charge. A very strong shock was felt, as already observed, when this conductor was discharged upon a pointed wire held in a person's hand, even though the wire communicated with the earth; which was not felt, or but very little, when a knobbed wire was made use of.—To account for this difference may, perhaps, puzzle electricians; but with regard to the use of blunt or pointed thunder-rods, both experiments seem quite inconclusive. Though a very great quantity of electric matter silently drawn off will fire gunpowder, this only proves that a pointed conductor ought not to pass through a barrel of gunpowder; and if a person holding a pointed wire in his hand received a strong shock from Mr Wilson's great conductor, it can thence only be inferred, that in the time of thunder nobody ought to hold the conductor in their hands; both which precautions common-sense would dictate without any experiment. From the accident at Purfleet, however, the disputants on both sides ought to have seen, that, with regard to lightning, neither points nor knobs can *attract*. Mr Wilson surely had no reason to condemn the pointed conductor for *soliciting* the flash of lightning, seeing it did not strike the point of the conductor, but a blunt cramp of iron; neither have the Franklinians any reason to boast of its effect in *silently drawing off* the electric matter, since all its powers were neither able to prevent the flash, nor to turn it 46 feet out of its way. The matter of fact is, the lightning was determined to enter the earth at the place where the board-house stands, or near it. The conductor fixed on the house offered the easiest communication: but 46 feet of air intervening between the point of the conductor and the place of explosion, the resistance was less through the blunt cramp of iron, and a few bricks moistened with rain-water, to the side of the metalline conductor, than through the 46 feet of air to its point; for the former was the way in which the lightning actually passed.

Mr Wilson and his followers seem also mistaken in supposing that a pointed conductor can solicit a greater discharge than what would otherwise happen. Allowing the quantity of electricity in the atmosphere during the time of a thunder-form to be as great

great as they please to suppose; nevertheless, it is impossible that the air can part with all its electricity at once, on account of the difficulty with which the fluid moves in it. A pointed conductor, therefore, if it does any thing at all, can only solicit the partial discharge which is to be made at any rate; and if none were to be made though the conductor was absent, its preference will not be able to effect any.

In a late publication on the subject of electricity by lord Mahon, we find a new kind of lightning made mention of, which he is of opinion may give a fatal stroke, even though the main explosion was at a considerable distance; a mile, for instance, or more. This he calls the *electrical returning stroke*; and exemplifies it in the following manner, from some experiments made with a very powerful electrical machine, the prime conductor of which (six feet long, by one foot diameter) would generally, when the weather was favourable, strike into a brass ball connected with the earth, to the distance of 18 inches, or more. In the following account this brass ball, which we shall call *A*, is supposed to be constantly placed at the *striking distance*; so that the prime conductor, the instant that it becomes fully charged, explodes into it.

Another large conductor, which we shall call the *second conductor*, is suspended, in a perfectly insulated state, farther from the prime conductor than the *striking distance*, but within its *electrical atmosphere*;—at the distance of six feet, for instance. A person standing on an insulating stool touches this *second conductor* very lightly with a finger of his right hand; while, with a finger of his left hand, he communicates with the earth, by touching very lightly a second brass ball fixed at the top of a metallic stand, on the floor, and which we shall call *B*.

While the prime conductor is receiving its electricity, sparks pass (at least if the distance between the two conductors is not too great) from the second conductor to the insulated person's right hand; while similar and simultaneous sparks pass out from the finger of his left hand into the second metallic ball *B*, communicating with the earth. These sparks are part of the *natural quantity* of electric matter belonging to the second conductor, and to the insulated person; driven from them into the earth, through the ball *B*, and its stand, by the elastic pressure or action of the electrical atmosphere of the prime conductor. The second conductor and the insulated person are hereby reduced to a *negative state*.

At length, however, the prime conductor, having acquired its *full charge*, suddenly strikes into the ball *A*, of the first metallic stand, placed for that purpose at the *striking distance* of 17 or 18 inches. The explosion being made, and the prime conductor suddenly robbed of its electric atmosphere, its pressure or action on the second conductor, and on the insulated person, as suddenly ceases; and the latter instantly feels a smart *returning stroke*, though he has no direct or visible communication (except by the floor) either with the *striking or struck body*, and is placed at the distance of five or six feet from both of them. This returning stroke is evidently occasioned by the sudden re-entrance of the electric fire *naturally* belonging to his body and to the second conductor, which had before been expelled from them by the action of the charged prime conductor

upon them; and which returns to its former place, the instant that action or elastic pressure ceases. The author shows, that there can be no reason to suppose that the electrical discharge from the prime conductor should, in this experiment, *divide itself* at the instant of the explosion, and go different ways, so as to strike the second conductor and insulated person in this manner, and at such a distance from it.

When the second conductor and the insulated person are placed in the *densest* part of the electrical atmosphere of the prime conductor, or *just beyond* the striking distance, the effects are still more considerable; the *returning stroke* being extremely severe and pungent, and appearing considerably sharper than even the *main stroke* itself, received directly from the prime conductor. This circumstance the author alleges as an unanswerable proof that the effect which he calls the *returning stroke*, was not produced by the *main stroke* being any *wise divided* at the time of the explosion, since *no effect* can ever be greater than the *cause* by which it is *immediately* produced.—Having taken the *returning stroke* eight or ten times one morning, he felt a considerable degree of pain across his chest during the whole evening, and a disagreeable sensation in his arms and wrists all the next day.

We come now to the application of this experiment, and of the doctrine deduced from it, to what passes in *natural electricity*, or during a thunder-storm; in which there is reason to expect similar effects, but on a larger scale:—a scale so large indeed, according to the author's representation, that persons and animals may be destroyed, and particular parts of buildings may be considerably damaged, by an electrical *returning stroke*, occasioned even by some *very distant explosion* from a thunder-cloud;—possibly at the distance of a mile or more.

It is certainly easy to conceive, that a charged extensive thunder-cloud must be productive of effects similar to those produced by the author's prime conductor. Like it, while it continues charged, it will, by the *superinduced elastic electrical pressure* of its atmosphere—to use the author's own expression—drive into the earth a part of the electric fluid *naturally* belonging to the bodies which are within the reach of its *widely extended* atmosphere; and which will therefore become *negatively* electrical. This portion too of their electric fire, as in the artificial experiments, will, on the explosion of the cloud, at a distance, and the cessation of its action upon them, suddenly *return* to them; so as to produce an equilibrium, and restore them to their *natural state*.

To this theory, the authors of the Monthly Review<sup>12</sup> have given the following answer: “We cannot, how-<sup>Answered</sup> ever, agree with the ingenious author, with respect to <sup>by the Rev</sup> viewers, the *greatness* of the effects, or of the danger to be apprehended from the *returning stroke* in this case; as we think his estimate is grounded on an erroneous foundation.— Since (says he) the density of the electrical atmosphere of a *thunder-cloud* is so *immense*, when compared to the electrical density of the electrical atmosphere of any *prime conductor*, charged by means of any electrical apparatus whatsoever; and since a *returning stroke*, when produced by the *sudden removal* of even the *weak* elastic electrical pressure of the electrical atmosphere of a charged *prime conductor*, may be extremely *strong*, as

Lightning. we have seen above; it is *mathematically evident*, that, when a *returning stroke* comes to be produced by the sudden removal of the very strong elastic electrical pressure of the electrical atmosphere of a thunder-cloud powerfully charged; the strength of such a *returning stroke* must be enormous.

"If indeed the quantity of electric fluid *naturally* contained in the body of a man, for instance, were immense, or indefinite, the author's estimate between the effects producible by a cloud, and those caused by a prime conductor, might be admitted. But surely an electrified cloud,—how great soever may be its extent, and the height of its charge, when compared with the extent and charge of a prime conductor—cannot expel from a man's body (or any other body) *more* than the *natural* quantity of electricity which it contains. On the sudden removal, therefore, of the pressure by which this natural quantity had been expelled, in consequence of the explosion of the cloud into the earth; *no more* (at the utmost) than his *whole natural stock* of electricity can re-enter his body (c). But we have no reason to suppose that this quantity is so great, as that its sudden re-entrance into his body should destroy or even injure him.

"In the experiment above described, the insulated person receives into his body, at the instant of the *returning stroke*, not only all that portion of his own natural electric fire which had been expelled from it; but likewise transmits through it, at the same instant, *in consequence of his peculiar situation*, all the electric fire of which the large second conductor had been robbed; and which must necessarily *re-pass* through his body, to arrive at that conductor. To render the case somewhat parallel, in *natural electricity*, the man's body must be so peculiarly circumstanced, supposing him to be in a house, that the electric matter which has been expelled from the house into the earth, by the pressure of an extensive thunder-cloud, could not return back into the building, on the explosion of the cloud at a distance, without passing through his body: a case not likely to happen, unless the house were insulated (like the second conductor in the preceding experiment), and his body became the channel through which alone the house could have its electric matter restored to it: it appears much more probable that the electric matter returns to the house through the *same channels* by which it before insensibly passed out, and with equal silence, tho' more suddenly.

"In the case of a man who is abroad, and in an open field, during the time of an explosion;—as he is unconnected with other masses of matter *above him*, no more than the precise quantity of electric fire, which had been before expelled from his body, will suddenly return into it at the instant of a distant explosion: and that this quantity is not usually very large, may be inferred from many considerations.

(c) "We suppose the person not to be so situated, that the *returning fire* of other bodies must necessarily pass through his body."

(d) "The author does indeed produce a *living evidence*, in the case of a person at Vienna, who, he has been credibly informed, received an electrical shock, by having held one hand accidentally in contact with an interrupted metallic conducting rod, at the instant that a thunder-cloud exploded at the distance, as was conjectured, of above half an English mile. He likewise observes, that a 'very strong, bright, and sudden stroke' (or spark) of electrical fire has been seen, by several electricians, to pass in the interval, or interruption, purposely left in the conducting rod of a house at the instant of a distant explosion; and 'when it was fully proved, by the sharp point of the conductor not being melted, or even tinged,' that the conductor itself had not been struck.—These observations, however, do not by any means prove the *magnitude*, or *danger*, of the returning stroke, but merely its *existence*: which we do not contest."

"When a person standing on the ground holds a *Lightning* pair of Mr Canton's balls in his hand, while a highly charged thunder-cloud is suspended over his head; the angle made by the balls indicates the *electrical state* of that person, or the quantity of *natural electricity* of which his body is at that time deprived, by the action of the (*positively*) charged cloud hanging over him. But we have never seen the repulsion of the balls so considerable, as to furnish any just apprehensions that the return of his natural electric matter, however sudden, could be attended with injury to him: nor would he be sensible of any commotion on the balls suddenly coming together; tho' a spark might undoubtedly be perceived, at that instant, were he insulated, and placed in the same manner with the author when he tried the above-related experiment.

"The author nevertheless observes, that 'there have been instances of persons who have been killed by *natural electricity*, having been found with their shoes torn, and with their feet damaged by the electrical fire; but who have not had, over their whole body, any other apparent marks of having been struck with lightning.' He adds, 'if a man walking out of doors were to be killed by a *returning stroke*, the electrical fire would rush into that man's body thro' his feet, and his feet only; which would not be the case, were he to be killed by any *main stroke* of explosion, either positive or negative.'

"It would be no difficult task, we think, to account for these appearances in a different manner; were all the circumstances attending the case minutely ascertained: but without interrogating the *dead* on this subject, we may more satisfactorily appeal to the experience of the *living* (d), to shew, that though the *returning stroke* must take place, in all thunder-storms, in *some degree or other*; yet it is not of that alarming magnitude which the author ascribes to it. If, in any particular thunder-storm, a man in the open fields could be killed, at the instant of a distant explosion, merely by the *return* of his *own* electric fire, which had before been driven out of his body; surely numerous observations of persons who had experienced the *returning stroke*, in *slighter* degrees, would be familiar; and scarce a great thunder-storm must have occurred, in which one person or another must not, at the instant of an explosion, have felt the effects of the *returning stroke*, in *some degree or other*—from that of a violent concussion, to that of a slight and almost imperceptible pulsation. But no observations of this kind are known to us; nor have we ever heard of any person's experiencing any kind of electrical commotion in a thunder-storm, except such as have either been directly struck, or have happened to be in the *very near neighbourhood* of the spot where the explosion took place.

"The author has been aware of this objection, which

lightning, which he proposes, and endeavours to remove: but his answer to it amounts to little more than what has been already quoted from him; that is, to a simple estimate of the enormous difference between the electrical density, or the *elastic electrical pressure*, of the atmosphere of an extensive *thunder-cloud*, and that of a charged *prime conductor*. We have already observed, that this is not the proper method of estimating their different effects, when these two causes, how unequal soever in power, are considered as exerting that power on bodies containing a *limited*, and comparatively *small*, quantity of electric matter.

"We have been induced to discuss this subject thus particularly, with a view to quiet the minds of the timorous; as the author's extension of his principles, respecting the returning stroke in *artificial electricity*, to what passes in *natural electricity*, holds out a new, and, in our opinion, groundless subject of terror to those who, in the midst of their apprehensions, have hitherto only dreaded the effects of a thunder-storm when it made near approaches to them; but who, if this doctrine were believed, would never think themselves in security while a thunder-cloud appeared in sight, unless sheltered in a house furnished with proper conductors:—for we should not omit to remark, that a subsequent observation tends to diminish their fears, by shewing that *high* and *pointed* conductors tend to secure both persons and buildings, against the various effects of any *returning stroke* whatever, as well as of the *main stroke*.

"Indeed various parts of this work, besides those immediately appropriated to the subject, tend to prove the utility of *high* and *pointed* conductors, in preference to those which terminate in a *ball*, or *rounded end*. Towards the end of the performance, the author discusses this matter very particularly; and enumerates the '*necessary requisites*' in erecting them, in number 11; to every one of which, tho' we have taken the liberty to differ from him on another subject, we readily subscribe. As this matter is of a popular nature, and on a subject generally interesting, we shall transcribe this list; adding a short explanation to particular articles.—These requisites (says the author) are 11 in number:

1st, That the rod be made of such substances, as are, in their nature, the *best conductors* of electricity."

2dly, That the rod be *uninterrupted*, and *perfectly continuous*.—"This is a very material circumstance. One entire piece of metal cannot perhaps be had: but it is not sufficient that the rods, of which the conductor consists, be *sensibly* in contact; they should be pressed into *actual* contact by means of nuts and screws, with a thin piece of sheet-lead between the shoulders of the joints.

3dly, That it be of a *sufficient thickness*.—"A copper rod half an inch square, or an iron rod one inch square, or one of lead two inches square, are thought fully sufficient by the author.

4thly, That it be perfectly connected with the common stock.—"That is, it should be carried deep into the earth, which is frequently dry near the surface; and then continued in a horizontal direction, so as to have the farther extremity dipped, should this be practicable, into water, at the distance of 10 yards or more from the foundation.

5thly, That the upper extremity of the rod be *astighting*, *acutely pointed* as possible.—"This termination should be of copper; or rather a very fine and exceedingly acute needle of *gold* should be employed, which will not materially add to the expence.

6thly, That it be very finely tapered:—"so that the upper extremity may be a cone, the diameter of the base of which may bear an extremely small proportion to its height; for instance, that of *one* to *forty*.

7thly, That it be extremely prominent;—"that is, 8, 10, or 15 feet at least above the highest parts of the building. The author lays great stress on this circumstance; in consequence of the law above-mentioned, deduced by him from his experiments, relating to electric atmospheres. According to this law, the density of an electric atmosphere (the *negative* atmosphere, for instance, of the roof of a house, &c. while a *positively* charged cloud hangs over it) diminishes in the inverse ratio of the *square* of the distance from the surface of the body to which that atmosphere belongs. Accordingly, if the rod project 12 feet into this atmosphere, it will reach to a part of it *four* times less dense than if the rod projected only to *half* that distance, or six feet;—and to a part *one hundred and forty* times rarer, than if it projected only *one* foot.

8thly, That each rod be carried, in the shortest convenient direction, from the point at its upper end, to the common stock."

9thly, That there be neither large nor prominent bodies of metal upon the top of the building proposed to be secured, but such as are connected with the conductor, by some proper metallic communication."

10thly, That there be a *sufficient number* of high and pointed rods.—"On edifices of great importance, especially magazines of gun-powder, the author thinks these ought never to be above 40 or 50 feet asunder.

11thly, That every part of the rods be very substantially erected."

"The author declares that he has never been able to hear of a *single* instance, nor does he believe that any can be produced, of an *high*, *tapering*, and *acutely pointed* metallic conductor, having ever, in any country, been struck by lightning; if it had *all* the necessary requisites abovementioned, especially the second and fourth."

On the whole, it seems to be pretty certain, that both pointed and knobbed metalline conductors <sup>14</sup>do have the power of preferring any body placed at a small distance from them from being struck by lightning. This they do, not because they can *attract* the lightning far out of its way, but because the resistance to its passage is always least on that side where they are; and as pointed conductors diminish the resistance more considerably than blunt ones, they seem in all cases to be preferable.—It appears, however, that a single conductor, whether blunt or pointed, is not capable of securing all the parts of a large building from strokes of lightning; and therefore several of them will be required for this purpose: but to what distance their influence extends, hath not been determined, nor does it seem easily capable of being ascertained.

It now remains only to explain some of the more <sup>15</sup>uncommon appearances and effects of lightning. One thing some of these is, that it is frequently observed to kill alternately, ternately: that is, supposing a number of people <sup>15</sup>standing

Lightning.

standing in a line; if the first person was killed, the second perhaps would be safe; the third would be killed, and the fourth safe; the fifth killed, &c.—Effects of this kind are generally produced by the most violent kind of lightning; namely, that which appears in the form of balls, and which are frequently seen to divide themselves into several parts before they strike. If one of these parts of a fire-ball strikes a man, another will not strike the person who stands immediately close to him; because there is always a repulsion between bodies electrified the same way. Now, as all these parts into which the ball breaks have all the same kind of electricity, it is evident that they must for that reason repel one another; and this repulsion is so strong, that a man may be interposed within the stroke of two of them, without being hurt by either.

16  
Why it  
sometimes  
marks bod-  
ies with  
the form of  
a cross.

The other effect of lightning is mentioned under the article JERUSALEM, where those who attempted to rebuild the temple had the marks of crosses impressed upon their garments and bodies. This may reasonably be thought to arise from the same cause to which the angular appearance of lightning in the air is owing, namely, its violent impetus and velocity, together with the opposition of the atmosphere. A small stroke of lightning, sometimes indeed a very considerable one, cannot always enter the substance of terrestrial bodies, even when it touches them, for reasons already given. In this case it runs along their surface, and, as in its motion it is perpetually resisted by the atmosphere, it undoubtedly has the same angular motion which we often perceive in the atmosphere. If in this situation it happens to touch the human skin, or a garment, especially of linen, as being a conductor, it will undoubtedly leave a mark upon it; and this mark being of a zig-zag form, might, in the above instance, have been either taken for the exact form of a cross by the beholders, or have suggested that idea in relating the story to make it appear more wonderful.

These observations may serve to give some idea of the nature of lightning, and its operations after it appears in its proper form and bursts out from the cloud; but for an account of its original formation, and of the powers by which the clouds are at first electrified, and their electricity kept up notwithstanding many successive discharges of lightning, and the quantity of electric matter continually carried off by the rain, &c. see the article THUNDER.

*Artificial LIGHTNING.* Before the discoveries of Dr Franklin concerning the identity of electricity and lightning, many contrivances were invented in order to represent this terrifying phenomenon in miniature: the combustions of phosphorus in warm weather, the ascension of the vapour of spirit of wine evaporated in a close place, &c. were used in order to support the hypotheses which at that time prevailed; namely, that lightning was formed of some sulphureous, nitrous, or other combustible vapours, floating in long trains in the atmosphere, which by some unaccountable means took fire, and produced all the destructive effects of that phenomenon. These representations, however, are now no more exhibited; and the only true artificial lightning is universally acknowledged to be the discharge of electric matter from bodies in which it is artificially set in motion by our machines.

Lightfoot

Lignum

**LIGHTFOOT** (John), a very learned English divine in the 17th century, was educated in Christchurch, Cambridge. Sir Rowland Cotton, knight, took him into his family as his chaplain, and engaged him in the study of the Hebrew language. He resolved to travel; but changed his resolution, being importuned by the people of Stone in Staffordshire to be their minister. From hence he removed to Hornsey near London, for the sake of Sion-college library, where he discharged the duties of his function, and prosecuted his rabbinical studies, till June 1642, when he retired to London, was chosen minister of St Bartholomew's behind the Exchange, and appointed one of the assembly of divines in 1643. August 26, 1645, he preached, before the house of commons, a sermon printed at London the same year, in which he recommends to the parliament a *Review and Survey* of the translation of the bible, and to hasten the settling of the church. In 1655, he was chosen vice-chancellor of the university of Cambridge. He was collated to a prebend in the cathedral of Ely by Sir Orlando Bridgeman, then keeper of the great seal. He published several valuable works, particularly "The Harmony of the Old, and the Harmony of the New Testament," &c. He died in 1675, aged 74.

**LIGNICENSIS TERRA**, in the materia medica, the name of a fine yellow bole dug in many parts of Germany, particularly about Emeric in the circle of Westphalia, and used in cordial and astringent compositions.

**LIGNUM COLUBRINUM.** See OPHIORHIZA.

**LIGULATED**, among botanists, an appellation given to such stamules as have a straight end turned downwards, with three indentures, but not separated into segments.

**LIGURIA** (anc. geog.), a country of Italy, bounded on the south by the Mediterranean sea, on the north by the Appennine mountains, on the west by part of Transalpine Gaul, and on the east by Etruria. There is a great disagreement among authors concerning the origin of the Ligurians, though most probably they were descended from the Gauls. Some carry up their origin as far as the fabulous heroes of antiquity; while others trace them from the Ligyes, a people mentioned by Herodotus as attending Xerxes in his expeditions against Greece. These Ligyes are by some ancient geographers placed in Colchis; by others, in Albania.—According to Diodorus Siculus, the Ligurians led a very wretched life; their country being entirely overgrown with woods, which they were obliged to pull up by the root, in order to cultivate their land, which was also encumbered with great stones, and, being naturally barren, made but very poor returns for all their labour. They were much addicted to hunting; and, by a life of continual exercise and labour, became so strong, that the weakest Ligurian was generally an overmatch for the strongest and most robust among the Gauls. The women are said to have been almost as strong as the men, and to have borne an equal share in all laborious enterprises. With all their bravery, however, they were not able to resist the Roman power; but were subdued by that warlike nation, about 211 B. C.

**LIGUSTICUM, LOYAGE**; a genus of the digynia order, belonging to the pentandria class of plants. There are six species, of which the most remarkable

are,

*astrum*, *quene*. are, the levisiticum or common, and the fœticum or Scots, lovage. The first is a native of the Apennine mountains in Italy. It hath a thick, fleshy, deeply-penetrating perennial root, crowned by very large, many-parted, radical leaves, with broad lobes, having incisions at top, upright, strong, channelled stalks, branching six or seven feet high, and all the branches terminated by yellow flowers in large umbels. The second is a native of Scotland, and grows near the sea in various parts of the country. It hath a thickish, fleshy, penetrating, perennial root, crowned by large doubly-trifoliate leaves, with broad, short, indented lobes, upright, round stalks, half a yard high; terminated by small yellow umbels. Both species are hardy, and easily propagated by seeds sown in spring or autumn.

*Medicinal uses, &c.* The root of the first species agrees nearly in quality with that of angelica: the principal difference is, that the lovage root hath a stronger smell, and a somewhat less pungent taste, accompanied with a more durable sweetness, the seeds being rather warmer than the root; but though certainly capable of being applied to useful purposes, this root is not regarded in the present practice. The leaves of the second are sometimes eaten raw as a salad, or boiled as greens, by the inhabitants of the Hebrides. The root is reckoned a good carminative. They give an infusion of the leaves in whey to their calves to purge them.

**LIGUSTRUM**, *PRIVET*; a genus of the monogynia order, belonging to the diandria class of plants. — There is but one species; of which there are two varieties, the deciduous and the evergreen. They are hardy plants, rising from 10 to 15 feet high, adorned with oblong entire leaves, and spikes of infundibuliform oblong white flowers succeeded by black-berries. They are easily propagated by seed, layers, suckers, or cuttings. They are used for making hedges. The purple colour upon cards is prepared from the berries. With the addition of alum, these berries are said to dye wool and silk of a good and durable green; for which purpose they must be gathered as soon as they are ripe. The leaves are bitter and slightly astringent. Oxen, goats, and sheep, eat the plant; horses refuse it.

**LILBURNE** (John), an enthusiastic demagogue, who was tyrannically punished by the star-chamber court, being put in the pillory, whipped, fined and imprisoned, for importing and publishing seditious pamphlets, which he had got printed in Holland; they chiefly reflected on the church of England and its bishops: he suffered in 1637, and in prison was doubly loaded with irons. In 1641, he was released by the long parliament; and from this time, he had the address to make himself formidable to all parties, by his bold, aspiring genius. He signalized himself in the parliament army; and was at one time the secret friend and confidant of Cromwell, and at another his avowed enemy and accuser; so that, in 1650, Cromwell found it to be his interest to silence him, by a grant of some forfeited estates. But after this, he grew outrageous against the protector's government; became chief of the levellers; and was twice tried for high treason, but acquitted by the juries. The last was for returning from exile (having

been banished by the parliament) without a pass. He died in 1657, aged 88.

**LILIACEOUS**, in botany, an appellation given to such flowers as resemble those of the lily.

**LILIUM**, the *LILY*; a genus of the monogynia order, belonging to the hexandria class of plants. There are nine species, all of them bulbous-rooted, herbaceous, flowery perennials, rising with erect annual stalks three or four feet high, garnished with long narrow leaves, and terminated by fine clusters of large, bell-shaped, hexapetalous flowers of exceeding great beauty, of white, red, scarlet, orange, purple, and yellow colours.

*Culture.* All the species are propagated by sowing the seeds; and if care is taken to preserve these seeds from good flowers, very beautiful varieties are often produced. The manner of sowing them is as follows. Some square boxes should be procured, about six inches deep, with holes bored in the bottoms to let out the wet: these must be filled with fresh, light, sandy earth; and the seeds sown upon them pretty thick in the beginning of August, and covered over about half an inch deep with light sifted earth of the same kind. They should then be placed where they may have the morning sun; and if the weather proves dry, they must be watered at times, and the weeds carefully picked out. In the month of October the boxes are to be removed to a place where they may have as much sun as possible, and be secured from the north and north-east winds. In spring the young plants will appear, and the boxes are then to be removed into their former situation. In August the smallest roots are to be emptied out of these boxes, and strewed over a bed of light earth, and covered with about half an inch depth of earth of the same kind sifted over them. Here they must be watered, and shaded at times, and defended from the severity of winter by a slight covering of straw or pease-haulm in the hardest weather. In February, the surface of the bed should be cleared, and a little light earth sifted over it. When the leaves are decayed, the earth should be a little stirred over the roots, and in the month of September following some more earth sifted on. In the September of the following year, the roots must be transplanted to the places where they are to remain, and set at the distance of eight inches; the roots being placed four inches below the surface: this should be done in moist weather. They will now require the same care as in the preceding winters; and the second year after they are transplanted, the strongest roots will begin to flower. The fine ones should then be removed at the proper season into flower-beds, and planted at great distances from one another that they may flower strong.

*Medical uses.* The roots of the white lily are emollient, maturating, and greatly suppurative. They are used externally in cataplasms for these purposes with success. The common form of applying them is boiled and bruised; but some prefer the roasting them till tender, and then beating them to a paste with oil, in which form they are said to be excellent against burns. Gerard recommends them internally against dropsies.

**LILLO** (George), an excellent dramatic writer, born at London in 1693. He was a jeweller by profession, and followed his business for many years in that

Lilly.

that neighbourhood with the fairest reputation. He wrote several dramatic pieces, which with his life were lately collected in two volumes 12mo. He died in 1739.

LILLY (John), a dramatic poet, was born in the wilds of Kent, about the year 1553, and educated in Magdalen-college, Oxford, where he took the degree of bachelor of arts in 1573, and that of master in 1575. From Oxford he removed to Cambridge; but how long he continued there, is uncertain. On his arrival in London, he became acquainted with some of queen Elizabeth's courtiers, by whom he was cherished, and admired as a poet and a wit; and her majesty, on particular festivals, honoured his dramatic pieces with her presence. His plays are nine in number. His first publication, however, printed in 1580, was a romance called *Euphues*, which was universally read and admired. This romance, which Blount, the editor of six of his plays, says introduced a new language, especially among the ladies, is, according to Berkenhout, in fact a most contemptible piece of affectation and nonsense: nevertheless it seems very certain, that it was in high estimation by the women of fashion of those times, who, we are told by Whalley the editor of Ben Jonson's works, had all the phrases by heart; and those who did not speak *Euphuism* were as little regarded at court as if they could not speak French. "He was," says Oldys, "a man of great reading, good memory, ready faculty of application, and uncommon eloquence; but he ran into a vast excess of allusion." When or where he died, is not known. Anthony Wood says he was living in 1597, when his last comedy was published. After attending the court of queen Elizabeth thirteen years, notwithstanding his reputation as an author, he was under a necessity of petitioning the queen for some small stipend to support him in his old age. His two letters or petitions to her majesty, on this subject, are preserved in manuscript.

LILLY (William), a noted English astrologer, born in Leicestershire in 1602; where his father not being able to give him more learning than common writing and arithmetick, he resolved to seek his fortune in London. He arrived in 1620, and lived four years as servant to a mantua-maker in the parish of St Clements Danes; but then moved a step higher to the service of Mr Wright, master of the Salter's company, in the Strand, who not being able to write, Lilly among other offices kept his books. In 1627, when his master died, he paid his addresses to the widow, whom he married with a fortune of 1000*l*. Being now his own master, he followed the puritanical preachers; and, turning his mind to judicial astrology, became pupil to one Evans, a profligate Welch parson, in that pretended art. Getting a MS. of the *Artis notitia* of Corn. Agrippa, with alterations, he drank in the doctrine of the magic circle, and the invocation of spirits, with great eagerness. He was the author of the *Merlinus Anglicus junior*; *The Supernatural Sight*; and *The White King's Prophecy*. In him we have an instance of the general superstition and ignorance that prevailed in the time of the civil war between Chas. I. and his parliament: for the king consulted this astrologer, to know in what quarter he should conceal himself, if he could escape from Hampton-court; and

general Fairfax, on the other side, sent for him to his army, to ask him if he could tell by his art, whether God was with them and their cause? Lilly, who made his fortune by favourable predictions to both parties, assured the general, that God would be with him and his army. In 1648, he published his *Treatise of the three Suns* seen the preceding winter; and also an astrological judgment upon a conjunction of Saturn and Mars. This year the council of state gave him in money 50*l*. and a pension of 100*l*. *per annum*, which he received for two years, and then resigned on some disgust. In June 1660, he was taken into custody by order of the parliament, by whom he was examined concerning the person who cut off the head of king Charles I. The same year he sued out his pardon under the great seal of England. The plague raging in London, he removed with his family to his estate at Hertham; and in October 1666, was examined before a committee of the house of commons concerning the fire of London, which happened in September that year. After his retirement to Hertham, he applied himself to the study of phylis, and, by means of his friend Mr Ashmole, obtained from archbishop Sheldon a licence for the practice of it. A little before his death he adopted for his son, by the name of *Merlin junior*, one Henry Coley, a taylor by trade; and at the same time gave him the impression of his almanac, after it had been printed for 36 years. He died in 1681, of a dead palsy. Mr Ashmole set a monument over his grave in the church of Walton upon Thames. His "Observations on the Life and Death of Charles late king of England," if we overlook the astrological nonsense, may be read with as much satisfaction as more celebrated histories, Lilly being not only very well informed, but strictly impartial. This work, with the *Lives of Lilly and Ashmole*, written by themselves, were published in one vol 8vo, in 1774, by Mr Burman.

LILYÆUM, (anc. geog.), a city of Sicily, situated on the most westerly promontory of the island of Sicily, and said to have been founded by the Carthaginians on their expulsion from Motya by Dionysius tyrant of Syracuse. It is remarkable for three sieges it sustained; one against Dionysius the tyrant, another against Pyrrhus king of Epirus, and the third against the Romans. The two first failed in their attempts, but the Romans with great difficulty made themselves masters of it. No remains of this once stately city are now to be seen except some aqueducts and temples; though it was standing in Strabo's time.

LILYE (William), the grammarian, was born in the year 1478, at Odiham in Hampshire; and in 1486, was admitted a semi-commoner of Magdalen college, in Oxford. Having taken the degree of bachelor of arts, he left the university, and travelled to Jerusalem. Returning from thence, he continued five years in the island of Rhodes, where he studied the Greek language, several learned men having retired thither after the taking of Constantinople. From Rhodes he travelled to Rome; where he improved himself in the Greek and Latin languages, under Sulpitius and P. Sabinus. He then returned to London, where for some time he taught a private grammar-school, being the first person who taught Greek in the metropolis. In 1510, when Dr Colet founded St Paul's school, Lilyc was appointed

Lilly.

Lilyc.

pointed the first master; at which time, it seems, he was married and had many children. In this employment he had laboured 12 years, when, being seized by the plague, which then raged in London, he died in February 1523, and was buried in the north yard of St Paul's. He had the character of an excellent grammarian, and a successful teacher of the learned languages. His principal work is *Brevissima institutio, seu ratio grammaticæ cognoscendæ*; Lond. 1513. Reprinted times without number, and commonly called *Lily's grammar*. The English rudiments were written by Dr Colet, dean of St Paul's; and the preface to the first edition, by cardinal Wolsey. The English syntax was written by Lily; also the rules for the genders of nouns, beginning with *Propria quæ maribus*; and those for the preterperfect tenses and supines, beginning with *As in præsentis*. The Latin syntax was chiefly the work of Erasmus. See Ward's preface to his edition of Lily's Grammar, 1732.

LIMA, a city of South America, in Peru, of which it is capital, with an archbishop's see, and an university. It gives its name to the principal audience of Peru; and is surrounded with brick walls, fortified with several ramparts and bastions, eight yards high. The streets are handsome, and as straight as a line; but the houses are generally only one story high, on account of the earthquakes. However, they are pretty enough, and well adorned, having long galleries on the front. One part of the roofs are covered with coarse linen cloth, and the others only with reeds, which is not inconvenient, because it never rains here; however, the richest inhabitants cover theirs with fine mats, or beautiful cotton-cloths. There are trees planted all round their houses, to keep off the heat of the sun. What the houses want in height they have in length and depth; for some of them are 200 feet long, and proportionably broad, so that they have 10 or 12 large apartments on the ground-floor. The royal square is very handsome, and in the middle there is a fountain of bronze, adorned with the image of fame, which spouts out water. On the east and west sides are the public structures, which are well built. The river which crosses Lima forms canals or streams which run to most of the houses, and serve to water their gardens, as well as for other uses. All the churches and convents are extremely rich; and many images of the saints are of massy gold, adorned with jewels. This city is four miles in length, and two in breadth, and is divided into eight parishes; and yet it contains but 28,000 inhabitants, whereof 9000 are Spaniards. They make use of mules to draw their coaches with, and of these there are about 5000. It is the seat of the viceroy; and contains several courts, as that of the viceroy, of the archbishop, of the inquisition, of the crusado, and of the wills. Earthquakes are here very frequent; some of which have done this city a great deal of damage, particularly that in 1746, whereby it was almost destroyed: were it not for this, it would be a perfect paradise; there being plenty of corn, wine, oil, sugar, fruits, and flax. The inhabitants are so rich, that when the viceroy, who was duke of Palata, and sent from Spain to Peru in 1672, made his public entrance into this city, the inhabitants paved the streets he was to pass through with ingots of silver. The inhabitants of Lima are very debauched, but at the same time ex-

remely superstitious, and they have a strong belief in the power of charms. About a fourth part of the city are monks and nuns, who are not a jot more chaste than the rest; and if any one happens to rival a monk, he is in danger of his life, for they always carry a dagger under their frocks. The nuns are such libertines, that it is hard to find any free from the French disease, of which they sometimes die for want of good physicians. The greatest sinners think they atone for all their faults by hearing a mass, and kissing the robe of St Francis or St Dominic, and then they return to their former practices. It is seated on a large, pleasant, fertile plain, on a small river, near the sea. W. Long. 68. 45. S. Lat. 12. 15.

LIMAX, the slug, or *Naked Snail*; a genus of insects, belonging to the order of vermes mollusca; the characters of which are these: The body is oblong, fitted for crawling, with a kind of muscular coat on the upper part; and the belly is plain: they have a roundish hole in the side, near the neck, which serves for the purpose of genitals, and for voiding their excrements. They have likewise four tentacula, or horns, situated above the mouth, which they extend or retract at pleasure. There are eight species, distinguished entirely by their colour; as the black slug, the white slug, the reddish slug, the ash-coloured slug, &c. The last of these, the agrestis or field-slug, is very common in gardens, and destructive to plants. They are sometimes swallowed by consumptive persons, to whom they are thought to be of service. Snails are said to be hermaphrodites, and mutually to impregnate each other. See REPRODUCTION.

LIMB, in general, denotes the border or edge of a thing; thus we say, the limb of a quadrant, of the sun, of a leaf, &c.

LIMB, in anatomy, an appellation given to the extremities of the body, as to the arms and legs.

LIMB, *Limbus*, in the church of Rome, is used in two different senses. 1. The limb of the patriarchs is said to be the place where the patriarchs waited the redemption of mankind: in this place they suppose our Saviour's soul continued from the time of his death to his resurrection. 2. The limb of infants dying without baptism, is a place supposed to be distinct both from heaven and hell; since, say they, children dying innocent of any actual sin, do not deserve hell; and, by reason of their original sin, cannot be admitted into heaven.

LIMBORCH (Philip), a learned writer among the remonstrants, born at Amsterdam in 1633. After having made great proficiency in his studies, he was, in 1655, admitted to preach in public, which he did first at Harlem. His sermons had in them no affected eloquence; but were solid, methodical, and edifying. He was chosen minister of Goudja; from whence he was called to Amsterdam, where he had the professorship of divinity, in which he acquitted himself with great reputation till his death, which happened in the 1712. He had an admirable genius, and a tenacious memory. He had many friends of distinction in foreign parts as well as in his own country. Some of his letters to Mr Locke are printed with those of that celebrated author. He had all the qualifications suitable to the character of a sincere divine, lived an example of every virtue, and preserved the vigour of his body and mind to a con-

Limax  
||  
Limborch.

**LIMBURGH** considerable age. He wrote many works, which are esteemed; the principal of which are, 1. *Amica collatio de veritate religionis Christianae cum eruditio Ju-deo*, in 12mo. 2. A complete body of Divinity, according to the opinions and doctrines of the re-mon-strants. 3. A history of the Inquisition; which has been translated into English by Dr Samuel Chandler. Limborch also published the works of the famous E-piscopius, who was his great-uncle by the mother's side.

**LIMBURGH DUCHY**, a province of the Austrian Netherlands, bounded by the duchy of Juliers on the north and east, by Luxemburg on the south, and by the bishopric of Liege on the west. It is about 30 miles in length, and 25 in breadth; and consists of good arable and pasture land, with plenty of wood, and some iron mines.

**LIMBURGH**, the capital city of the duchy of Lim-burgh, in the Austrian Netherlands, is seated on a steep rock near the river Vesse. This town is small, but plea-santly seated on a hill, with shady woods; and consists chiefly of one broad street, not very well built. It is strong by situation, and almost inaccessible; however, it was taken by the French in 1675, and by the confederates under the duke of Marlborough in 1603, for the house of Austria, to whom it remains by the treaties of Rastadt and Baden, after having been dis-mantled. It is famous for its cheese, which is exceed-ing good. E. Long. 6. 8. N. Lat. 50. 40.

**LIME**. See **QUICKLIME**.

**LIMERICK**, a county of Ireland in the province of Munster, is bounded on the east by Tipperary, on the west by Kerry, on the north by the river Shan-non, and on the south by Cork. It is 48 miles in length, and 27 in breadth; being a fertile country and well inhabited, but has few good towns: the west parts are mountainous, and the rest plain; and it is divided into nine baronies.

**LIMERICK**, or *Lough-Meath*, a market-town, a bo-rough, and a bishop's see, now the metropolis of the province of Munster. It is an elegant, rich, populous city, and of singular strength, seated partly on an island of the river Shannon, and is counted two towns; in the upper stands the castle and cathedral. It has two handsome bridges of stone, as also bulwarks and little drawbridges, the one leading to the west and the other to the east; to this the lower town is joined, and is strengthened with a wall, a castle, and a fore-gate, at the entrance into it. It was besieged by king Wil-liam III. in the year 1690; and though there was no army to assist it, the king was obliged to raise the siege. In the year 1691, it was again besieged by the English and Dutch on the 21st of September; and it was obliged to surrender on the 13th of October fol-lowing, not without the loss of abundance of men; however, the garrison had very honourable and advan-tageous conditions, being permitted to retire where they thought fit, and the Roman-catholics by these ar-ticles were to be tolerated in the free exercise of their religion. W. Long. 8. 30. N. Lat. 52. 35.

**LIMINGTON**, a town of Hampshire in England. See **LIMINGTON**.

**LIMIT**, in a restrained sense, is used by mathema-ticians for a determined quantity to which a variable one continually approaches; in which sense, the circle

may be said to be the limit of its circumscribed and inscribed polygons. In algebra, the term *limit* is ap-plied to two quantities, one of which is greater and the other less than another quantity; and in this sense it is used in speaking of the limits of equations, whereby their solution is much facilitated.

**LIMNING**, the art of painting in water-colours, in contradistinction to painting which is done in oil-colours.

Limning is much the more ancient kind of paint-ing. Till a Flemish painter, one John van Eyck, bet-ter known by the name of *John of Bruges*, found out the art of painting in oil, the painters all painted in water, and in fresco, both on their walls, on wooden boards, and elsewhere. When they made use of boards, they usually glued a fine linnen cloth over them, to prevent their opening; then laid on a ground of white; lastly, they mixed up their colours with water and size, or with water and yolks of eggs, well beaten with the branches of a fig-tree, the juice whereof thus mixed with the eggs; and with this mixture they painted their pieces.

In limning, all colours are proper enough, except the white made of lime, which is only used in fresco. The azure and ultramarine must always be mixed with size or gum; but there are always applied two layers of hot size before the size-colours are laid on: the col-ours are all ground in water each by itself; and, as they are required in working, are diluted with size-wa-ter. When the piece is finished, they go over it with the white of an egg well beaten; and then with var-nish, if required.

To limn, or draw a face in colours: Having all the materials in readiness, lay the prepared colour on the card even and thin, free from hairs and spots over the place where the picture is to be. The ground being laid, and the party placed in a due position, begin the work, which is to be done at three sittings. At the first you are only to dead-colour the face, which will require about two hours. At the second sitting, go over the work more curiously, adding its particular graces or deformities. At the third sitting, finish the whole; carefully remarking whatever may conduce to render the piece perfect, as the cast of the eyes, moles, scars, gestures, and the like.

**LIMOGES**, an ancient and considerable town of France, in the province of Guienne, and capital of Limosin, with a bishop's see. It is a trading place, and its horses are in great esteem. It is seated on the river Vienne, in E. Long. 1. 22. N. Lat. 42. 48.

**LIMOSIN**, a province of France, bounded on the north by La Marche, on the east by Auvergne, on the south by Quercy, and on the west by Perigord and Angoumois. It is divided into the Upper and Lower; the former of which is very cold, but the latter more temperate. It is covered with forests of chestnut-trees; and contains mines of lead, copper, tin, and iron; but the principal trade consists in cattle and horses.

**LIMPEL**. See **PATELA**.

**LIMPURG**, a barony of Germany, in the circle of Franconia, included almost entirely within Suabia, and seated to the south of Hall in Suabia. It is a-bout 15 miles long, and eight broad. Gaildorf and Shonburg, near which is the castle of Limpurg, are the principal places.

**LIM-**

mpary,  
n. l. c.

LIMBURG, a town of Germany, in the electorate of Tiers or Treves, and in Wetteravia, formerly free and imperial, but now subject to the electorate of Treves. It is seated on the river Lhon. E. Long. 8. 13. N. Lat. 50. 18.

LINARIA, in ornithology. See *FRINGILLA*.

LINACRE (Thomas), physician, was born at Canterbury about the year 1460, and there educated under the learned William Selling: thence he removed to Oxford, and in 1484 was chosen fellow of All-Souls college. Tilly, alias Selling, his former instructor, being at this time appointed ambassador from king Henry VII. to the court of Rome, Mr Linacre accompanied him to Italy, where he attained the highest degree of perfection in the Greek and Latin languages. At Rome, he applied himself particularly to the study of Aristotle and Galen, in the original. On his return to Oxford, he was incorporated doctor of physic, and chosen public professor in that faculty. But he had not been long in England, before he was commanded to court by king Henry VII. to attend the young prince Arthur as his tutor and physician. He was afterwards appointed physician to the king, and, after his death, to his successor Henry VIII.

Dr Linacre founded two medical lectures at Oxford, and one at Cambridge; but that which most effectually immortalized his name among the faculty, is his being the first founder of the college of physicians in London. He beheld with vexation the wretched state of physic in those times; and, by an application to cardinal Wolsey, obtained a patent in 1518, by which the physicians of London were incorporated. The intention of this corporation was to prevent illiterate and ignorant medicalists from practising the art of healing. Doctor Linacre was the first president, and held the office as long as he lived. Their meetings were in his own house in Knight-rider street, which house he bequeathed to the college. But our doctor, when he was about the age of 50, took it into his head to study divinity; entered into orders; and was collated, in 1509, to the rectory of Merham. In the same year he was installed prebendary of Wells, in 1518 prebendary of York, and in the following year was admitted precentor of that cathedral. This, we are told, he resigned for other preferments. He died of the stone in the bladder in October 1524, aged 64; and was buried in St Paul's. Thirty-three years after his death, doctor John Caius caused a monument to be erected to his memory, with a Latin inscription, which contains the outlines of his life and character. He was a man of great natural sagacity, a skilful physician, a profound grammarian, and one of the best Greek and Latin scholars of his time. Erasmus in his epistles speaks highly of the doctor's translations from Galen, preferring them even to the original Greek. His works are, 1. *De emendata structura Latini sermonis, libri sex*; London, printed by Pynson, 1524, 8vo. and by Stephens, 1527, 1532. 2. *The rudiments of grammar*, for the use of the prince's Mary, printed by Pynson. Buchanan translated it into Latin; Paris, 1536. He likewise translated into very elegant Latin, several of Galen's works, which were printed chiefly abroad at different times. Also *Procli Diadochi sphaera*, translated from the Greek; Venet. 1499, 1500.

LINCOLN, a city of England, and capital of a county of the same name, stands on the side of a hill, at the bottom of which runs the river Witham. The old *Lindum* of the Britons, which stood on the top of the hill, as appears from the vestiges of a rampart, and deep ditches still remaining, was taken and demolished by the Saxons; who built a town upon the south side of the hill down to the river-side, which was several times taken by the Danes, and as often retaken by the Saxons. In Edward the Confessor's time, it appears, from Doomsday-book, to have been a very considerable place; and in the time of the Normans, Malmbury says, it was one of the most populous cities in England. William I. built a castle upon the summit of the hill above the town. The diocese, tho' the bishopric of Ely was taken out of it by Henry II. and those of Peterborough and Oxford by Henry VIII. is still vastly large, containing the counties of Leicesters, Huntingdon, Bedford, and part of Bucks, making 1255 parishes. Though the other churches are mean, the cathedral, or minster, is a most magnificent piece of Gothic architecture. Here is a prodigious large bell, called *Tom of Lincoln*, which is near five ton in weight, and 23 feet in compass. The hill on which the church stands is so high, and the church itself so lofty, that it may be seen 50 miles to the north, and 30 to the south. Besides other tombs, it contains one of brass, in which are the entrails of queen Eleanor, wife to Edward I. It is said there were anciently 52 churches, which are now reduced to 13. Such is the magnificence and elevation of the cathedral, that the monks thought the sight of it must be very mortifying to the devil; whence it came to be said of one who was displeased, *that he looked like the devil over Lincoln*. The declivity on which the city is built being steep, the communication betwixt the upper and lower town is very troublesome, and coaches and horses are obliged to make a compass. The little river Witham runs through the town; and on the west side forms a large pool, called, from the number of swans upon it, *swan-pool*, which has a communication with the Trent by a canal, called the *fosse-dyke*. In the upper town, many gentlemen, besides the prebendaries and others of the clergy, have handsome houses of modern architecture. There are four charity-schools, in each of which 30 poor children are taught by clergymen widows. It is governed by a mayor, 12 aldermen who are justices of the peace, two sheriffs, a recorder, four chamberlains, a sword-bearer, four coroners, and above 40 common-council; and has a vicinial jurisdiction 20 miles round, a privilege which no other city in England can boast of. The country round is very fertile and pleasant, and the tract called *Lincoln heath* extends above 50 miles. On the down, towards Boston, are sometimes seen those rare birds called *bustards*. Here are frequent horse-races, markets on Tuesday and Friday, fairs first Tuesday in April, June 24, first Friday in September, and November 17. It has given the title of earl to the family of Clinton, ever since the reign of queen Elizabeth. W. Long. 27. 1. N. Lat. 53. 16.

LINCOLNSHIRE, a maritime county of England, having the German ocean on the east, Northamptonshire on the south, from which it is separated by the river Welland, as it is on the west from Yorkshire by the

Lincoln,  
Lindsey.

the Humber: it has also on the west, part of Nottinghamshire, Leicestershire, and Rutlandshire. Its greatest length is above 60 miles, and its greatest breadth about 40, making upwards of 180 miles in circumference, containing 2162 square miles; or, according to others, 1,740,000 acres, 30 hundreds or wapentakes, 688 parishes, one city, five parliamentary boroughs, 34 other market-towns, and about 254,540 inhabitants. The names of the three grand divisions are Holland, Kesteven, and Lindsey; the last of which is by much the largest. The soil of Holland being marshy, the air is moist and foggy, and therefore unwholesome. Kesteven has a drier and more fruitful soil, and consequently a better air. Of the third division, Lindsey, the air is reckoned good and wholesome. There are many large rivers in the county, as the Nen, Welland, Gwash, Witham, Bane, Trent, Don, and Ankam, all abounding with fish. In the Fens are very rich pastures; so that their cattle are the largest in England, unless, perhaps, we should except those of Somersetshire: and at certain seasons the numbers of fowl are amazing, especially of ducks; so that Camden says, they could, in his time, about Crows "catch 1000 at once in August with a single net; and they called the pools where they caught them, their corn-fields, no corn then growing within five miles of the place: that of these fowls there were some sorts not only very rare, but extremely delicate, as the puittes, knotts, and goodwits; so that the nicest palates and richest purses greatly coveted them." The knotts are said to be so called, from their having been first brought from Denmark for the use of king Canute. The dotterel is so called because it is a very simple bird, and mimicks all the motions of the fowler, till it is easily caught by candle-light. They have all the common fruits, and some of them in greater perfection than in other parts of England. Their hares and their hounds are said to be exceeding swift. The fens seem to have been over-run with wood anciently, for trunks of trees are still found in them. The churches in Lincolnshire are said to be very fine, but the houses indifferent. There is a homely proverb, which says, that its hogs sh—t soap, and its cows fire; because the poor people wash their clothes with hogs dung, and, from the scarcity of other fuel, burn dried cow-dung. It is entirely in the diocese of Lincoln; and sends 12 members to parliament, viz. two knights for the shire, two citizens for Lincoln, two burgesses for Boston, two for Great Grimsby, two for Stamford, and two for Grantham.

LINDSEY (Sir David), a celebrated Scots poet, was descended of an ancient family, and born in the reign of king James IV. at his father's seat called the Mount, near Coupar in Fifeshire. He was educated at the university of St Andrews; and, after making the tour of Europe, returned to Scotland in the year 1514. Soon after his arrival, he was appointed gentleman of the bed-chamber to the king, and tutor to the young prince, afterwards James V. From the verses prefixed to his dream, we learn that he enjoyed several other honourable employments at court; but, in 1533, he was deprived of all his places, except that of *Lion king at arms*, which he held to the time of his death. His disgrace was most probably owing to his invectives against the clergy, which are frequent in

all his writings. After the decease of king James V. Sir David became a favourite of the earl of Arran, regent of Scotland; but the abbot of Paisley did not suffer him to continue long in favour with the earl. He then retired to his paternal estate, and spent the remainder of his days in rural tranquillity. He died in the year 1553. His poetical talents, considering the age in which he wrote, were not contemptible; but he treats the Romish clergy with great severity, and writes with some humour; but, whatever merit might be formerly attributed to him, he takes such licentious liberties with words, stretching, or carving them for measure or rhyme, that the Scots have a proverb, when they hear an unusual expression, that, *There is nae sic a word in a' Davie Lindsay*. Mackenzie tells us, that his comedies were so facetious, that they afforded abundance of mirth. Some fragments of these comedies are still preserved in manuscript. He is said to have also written several tragedies, and to have first introduced dramatic poetry into Scotland. One of his comedies was played in 1515. Mackenzie says, he understood nothing of the rules of the theatre. He was cotemporary with John Heywood, the first English dramatic poet. His poems are printed in one small volume; and fragments of his plays, in manuscript, are in Mr William Carmichael's collection.

LINDSEY, the third and largest division of the county of Lincolnshire in England. On the east and north it is washed by the sea, into which it runs out with a large front; on the west it has Yorkshire, and Nottinghamshire, from which it is yoked by the rivers Trent and Don; on the south it has Kesteven, from which it is separated by the river Witham, and the Foss-dyke, which is seven miles long, and was cut by Henry I. between the Witham and the Trent, for the convenience of carriage in those parts. It had its name from Lincoln, the capital of the county, which stands in it, and by the Romans called *Lindum*, by the Britons *Lyndeceit*, by the Saxons *Lindocolyne*, probably from its situation on a hill, and the lakes or woods that were anciently thereabouts; but the Normans called it *Nicol*. It gives title of earl and marquis to the duke of Ancaster.

LINDUS, (auc. geog.), a town of Rhodes, situated on an eminence, on the south-east side of the island; with a temple of Minerva surnamed *Lindia*, built by Danaus, Herodotus, and Strabo; in which the seventh Olympian ode of Pindar was written in letters of gold. The town was built by Tlepolemus the son of Hercules, according to Diodorus Siculus; by one of the Heliades, grandsons of the Sun, named *Lindus*, according to Strabo. It was the native place of Cleobulus, one of the wise men. It is still extant, and called *Lindo*.

LINE, in geometry, a quantity extended in length only, without any breadth or thickness. It is formed by the flux or motion of a point. See FLUXIONS, and GEOMETRY.

LINE, in the art of war, is understood of the disposition of an army ranged in order of battle with the front extended as far as may be, that it may not be flanked.

LINE of Battle, is also understood of a disposition of the fleet in the day of engagement; on which occasion the vessels are usually drawn up as much as possible

Lindsey  
|  
Lin.

**Line** in a straight line, as well to gain and keep the advantage of the wind as to run the same board. See *Naval Tactics*.

**Horizontal LINE**, in geography and astronomy, a line drawn parallel to the horizon of any part of the earth.

**Equinoctial LINE**, in geography, is a great circle on the earth's surface, exactly at the distance of 90° from each of the poles, and of consequence bisecting the earth in that part. From this imaginary line, the degrees of longitude and latitude are counted.—In astronomy, the equinoctial line is that circle which the sun seems to describe round the earth on the days of the equinox in March and September. See *ASTRONOMY*; and *GEOGRAPHY*, n° 28.

**Meridian LINE**, is an imaginary circle drawn thro' the two poles of the earth and any part of its surface. See *GEOGRAPHY*, n° 29.

**Ship of the LINE**, a vessel large enough to be drawn up in the line, and to have a place in a sea-fight.

**LINE**, in genealogy, a series or succession of relations in various degrees, all descending from the same common father. See *DESCENT*.

**LINE**, also denotes a French measure containing the 12th part of an inch or the 144th part of a foot. Geometricians conceive the line subdivided into six points. The French line answers to the English barley-corn.

**Fishing LINE**. See *FISHING LINE*.

**LINEs**, in heraldry, the figures used in armories to divide the shield into different parts, and to compose different figures. These lines, according to their different forms and names, give denomination to the pieces or figures which they form, except the straight or plain lines.

**LINEA ALBA**, in anatomy, the concourse of the tendons of the oblique and transverse muscles of the abdomen; dividing the abdomen in two, in the middle. It is called *linea*, line, as being straight; and *alba*, from its colour, which is white.—The *linea alba* receives a twig of a nerve from the intercostals in each of its digitations or indentings, which are visible to the eye, in lean persons especially.

**LINEAMENT**, among painters, is used for the outlines of a face.

**LINEAR NUMBERS**, in mathematics, such as have relation to length only; such is a number which represents one side of a plain figure. If the plain figure be a square, the linear figure is called a *root*.

**LINEAR Problem**; that which may be solved geometrically by the intersection of two right lines. This is called a *simple problem*, and is capable but of one solution.

**LINEN**, in commerce, a well-known kind of cloth chiefly made of flax. The linen manufacture was probably introduced into Britain with the first settlements of the Romans. The flax was certainly first planted by that nation in the British soil. The plant itself indeed appears to have been originally a native of the east. The woollen drapery would naturally be prior in its origin to the linen; and the fibrous plants from which the threads of the latter are produced, seems to have been first noticed and worked by the inhabitants of Egypt. In Egypt, indeed, the linen manufacture

Vol. VI.

appears to have been very early: for even in Joseph's time it had risen to a considerable height. From the Egyptians the knowledge of it proceeded probably to the Greeks, and from them to the Romans. Even at this day the flax is imported among us from the Eastern nations; the western kind being merely a degenerate species of it.

In order to succeed in the linen manufacture, one set of people should be confined to the ploughing and preparing the soil, sowing and covering the seed, to the weeding, pulling, rippling, and taking care of the new seed, and watering and dressing the flax till it is lodged at home: others should be concerned in the drying, breaking, scutching, and heckling the flax, to fit it for the spinners; and others in spinning and reeling it, to fit it for the weaver: others should be concerned in taking due care of the weaving, bleaching, beetling, and finishing the cloth for the market. It is reasonable to believe, that if these several branches of the manufacture were carried on by distinct dealers in Scotland and Ireland, where our home-made linens are manufactured, the several parts would be better executed, and the whole would be afforded cheaper, and with greater profit.

**Staining of LINEN**. Linen receives a black colour with much more difficulty than woollen or cotton. The black struck on linen with common vitriol and galls, or logwood, is very perishable, and soon washes out. Instead of the vitriol, a solution of iron in four strong-beer is to be made use of. This is well known to all the calico-printers; and by the use of this, which they call their *iron liquor*, and madder-root, are the blacks and purples made which we see on the common printed linens. The method of making this iron-liquor is as follows: A quantity of iron is put into the four strong-beer; and, to promote the dissolution of the metal, the whole is occasionally well stirred, the liquor occasionally drawn off, and the rust beat from the iron, after which the liquor is poured on again. A length of time is required to make the impregnation perfect; the solution being reckoned unfit for use till it has stood at least a twelvemonth. This solution stains the linen of a yellow, and different shades of buff colour; and is the only known substance by which these colours can be fixed on linen. The cloth stained deep with the iron liquor, and afterwards boiled with madder, without any other addition, becomes of the dark colour which we see on printed linens and cottons; which, if not a perfect black, has a very near resemblance to it. Others are stained paler with the same liquor diluted with water, and come out purple.

Linen may also be stained of a durable purple by means of solution of gold in aqua regia. The solution for this purpose should be as fully saturated as possible; it should be diluted with three times its quantity of water; and if the colour is required deep, the piece, when dry, must be repeatedly moistened with it. The colour does not take place till a considerable time, sometimes several days, after the liquor has been applied: to hasten its appearance, the subject should be exposed to the sun and free air, and occasionally removed to a moist place, or moistened with water.—When solution of gold in aqua regia is soaked up in linen cloths, the metal may be recovered by drying and burning them.

*Linens.*

Linen.

The anacardium nut, which comes from the East-Indies, is remarkable for its property of staining linen of a deep black colour, which cannot be washed out either with soap or alkaline ley. The stain is at first of a reddish-brown, but afterwards turns to a deep black on exposure to the air. The cashew-nut, called the *anacardium of the West-Indies*, differs from the oriental anacardium, in its colouring quality. The juice of this nut is much paler than the other, and stains linen or cotton only of a brownish colour; which indeed is very durable, but does not at all change towards blackness. There are, however, trees, natives of our own colonies, which appear to contain juices of the same nature with those of India. Of this kind are several, and perhaps the greater number, of the species of the toxicodendron or poison-tree †. Mr Catesby, in his history of Carolina, describes one called there the *poison-ash*, from whose trunk flows a liquid as black as ink, and supposed to be poisonous; which reputed poisonous quality has hitherto prevented the inhabitants from collecting or attempting to make any use of it. In the Philosophical Transactions for the year 1755, the abbé Mazars gives an account of three sorts of the toxicodendron raised in a botanic garden in France, containing in their leaves a milky juice, which in drying became quite black, and communicated the same colour to the linen on which it was dropped. The linen thus stained was boiled with soap, and came out without the least diminution of colour; nor did a strong ley of wood-ashes make any change in it. Several of these trees have been planted in the open ground in England, and some still remain in the bishop of London's garden at Fulham.

That species called by Mr Miller the *true lac tree*, was found by Dr Lewis to have properties of a similar kind. It contains in its bark, and the pedicles and ribs of the leaves, a juice somewhat milky, which soon changed in the air to a reddish-brown, and in two or three hours to a deep blackish or brownish-black colour: wherever the bark was cut or wounded, the incision became blackish; and on several parts of the leaves the juice had spontaneously exuded, and stained them of the same colour. This juice, dropped on linen, gave at first little or no colour, looking only like a spot of oil; but, by degrees, the part moistened with it darkened in the same manner as the juice itself. On washing and boiling the linen with soap, the stain not only was not discharged, but seemed to have its blackness rather improved; as if a brown matter, with which the black was manifestly debased, had been in part washed out, and left the black more pure.

As the milky juices of some of our common plants turn dark-coloured or blackish in drying, the doctor was induced to try the effects of several of them on linen. The milks of wild-poppies, garden-poppies, dandelion, hawk-weed, and fow-thistle, gave brown or brownish-red stains, which were discharged by washing with soap; the milks of the fig-tree, of lettuces, and of different kinds of sparges, gave no colour at all. The colourless juice which issues from hop-stalks when cut, stains linen of a pale-reddish or brownish-red, extremely durable; the colour was deepened by repeated applications of the juice, but it never made any approach to blackness. The juice of flaes gave likewise

a pale-brownish stain, which, by repeated washings with soap, and being wetted with strong solution of alkaline salt, was darkened to a deeper brown: on baking the flaes, their juice turns red; and the red stain which it then imparts to linen is, on washing with soap, changed to a pale-blueish, which also proves durable. These colours could not be deepened by repeated applications of the juice. The flaes were tried in different states of maturity, from the beginning of September to the middle of December, and the event was always nearly the same.

In the fifth volume of Linnæus's *Amenitates Academicæ*, mention is made of a black colour obtained from two plants which grow spontaneously in Britain; the one is the *allua spicata*, herb-christopher, or bane-berries; the other the *enica bacifera nigra*, black-berried heath, crow-berries, or crane-berries. The juice of the bane-berries boiled with alum, is said to yield a black ink; and the heath-berries, boiled also with alum, to dye linen of a purplish black.

*Linen flowered with Gold-leaf.* Dr Lewis informs us of a new manufacture established in London for embellishing linen with flowers and ornaments of gold-leaf. The linen, he says, looks whiter than most of the printed linens; the gold is extremely beautiful, and bears washing well. The doctor informs us, that he had seen a piece which he was credibly informed had been washed three or four times, with only the same precautions which are used for the finer printed linens; and on which the gold continued entire, and of great beauty.—Concerning the process used in this manufacture, he gives us no particulars.

*Fossil Linen*, is a kind of amianthus, which consists of flexible, parallel, soft fibres, and which has been celebrated for the uses to which it has been applied, of being woven, and forming an *incombustible cloth*. Paper also, and wicks for lamps, have been made of it. See AMIANTHUS and ASBESTOS.

LING, in zoology. See GADUS.

LINGEN, a strong town of Germany, in the circle of Westphalia, and capital of a county of the same name. It belongs to the king of Prussia; and is situated on the river Embs, in E. Long. 7. 30. N. Lat. 52. 32.

LINGELBACH (John), an excellent painter, born at Frankfurt on the Maine in 1625. He first learned the art in Holland, but perfected himself at Rome; where he studied till he was 25 years of age, when he settled at Amsterdam. His usual subjects are fairs, mountebanks, sea-pieces, and landscapes, which he composed and executed exceeding well: his landscapes are enriched with antiquities, animals, and elegant figures; his sea-fights are full of expression, exciting pity and terror, and all his objects are well designed. He had an uncommon readiness in painting figures and animals, on which account he was employed by several eminent artists to adorn their landscapes with such objects; and whatever he inserted in the works of other masters, were always well-adapted, and produced an agreeable effect. He died in 1687.

LINIMENT, in pharmacy, a composition of a consistence somewhat thicker than an unguent, and thicker than an oil used for anointing different parts of the body in various intentions.—The materials proper

† See RUBUS.

proper for composing *liniments* are, fats, oils, balsams, and whatever enters the composition of unguents and plasters.

**LINLITHGOWSHIRE**, or **WEST LOTHIAN**, a small county of Scotland, not exceeding 14 miles in length and 13 in breadth, is bounded on the north by part of Stirlingshire and the river Forth, by part of Clydesdale on the west, and on the south and west by Mid-Lothian, from which it is divided by the rivers Breich and Almond. The country is pleasant and fertile, abounding with corn and pasturage. Here is found plenty of coal, limestone, and lead ore; nay, in the reign of James VI. it produced a rich mine of silver. The chief town, Linlithgow, from which it borrows the name, is a royal borough and seat of a presbytery, standing on the side of a small lake, about 18 miles from Edinburgh: it consists of one open street, from whence lanes are detached on both sides; the houses are built of stone, tolerably neat and commodious; and the place is adorned with some stately public edifices. On the side of the lake stands a royal palace, magnificently built of hewn stone, begun by king James V. and perfected by his grandson. Within the inner court, which is larger than that of Hamilton, there is an artificial fountain, adorned with statues and water-works; and at each corner of the square a tower, with a range of fine apartments. Hard by the palace is the church of St Michael, a noble structure, with a very high steeple. The inhabitants carry on a great manufacture of linen, and bleach it with the water of this lake, which is noted for its whitening quality: they likewise enjoy a tolerable share of trade, by means of a good harbour on the Forth, where they have built a custom-house, and magazines or ware-houses for the use of the merchants. Hard by this harbour stands the castle of Blacknecfs, belonging to the crown, formerly used as a state prison, but now quite ruinous. The chiefs of the Livingstone family were earls of Linlithgow and Caeldar, hereditary keepers of the palace in this town, and hereditary constables of Blacknecfs castle. The last of these noblemen forfeited his estate and honours, by engaging in the rebellion of the year 1715.

**LINNÆUS** (Sir Charles), a celebrated botanist and natural historian, was born on May 24. 1707, O. S. in a village called *Roosbult*, in Smoland, where his father, Nicolas Linneus, was then vicar, but afterwards preferred to the curacy of Stenbroholt. On the farm where Linneus was born, there yet stands a large lime-tree, from which his ancestors took the surnames of *Tiliander*, *Lindelius*, and *Linneus*. Of such surnames, derived from some natural object, there are many other instances in Sweden, which seem to evince, at least, that the taste for natural knowledge is of a very ancient standing in that country. Charles's father, who was a great florist, regaled his wife, during her pregnancy with this her first son, with the choicest flowers; with which he also often bestrewed the child's cradle, and presented him with flowers instead of the usual toys. As soon as little Linné was able to run after his father, he made gardening his chief amusement. He soon knew garden-plants, and then began to gather such as grew wild in his neighbourhood; for which he found yet better opportunity at Wexiœ, whither he was, in 1717, sent to school.

In 1727, Linneus went to the academy at Lund, where the celebrated Kiisan Stobæus favoured his genius for natural knowledge with his patronage. Even at his native farm he had already hunted after insects; neither did he lose that taste, though he was at Lund once stung by the *furia infernalis*, and had very narrowly escaped with life. From Lund he, in 1728, proceeded to the university at Upsal, always pursuing his favourite studies; but found himself, within less than a year, involved in debts for board and cloathing, without prospect of being extricated by any remittances from his indigent parents. Olof Celsius, the excellent author of the *Hiero-botanicum*, happening once to find him in the botanical garden, busied with describing plants, and being surprized to hear him name them all, took a liking to him, and received him to his house, his table, and his library. By this and some other unexpected and fortunate incidents, our Linneus was enabled to pursue his studies, notwithstanding the original lowness of his finances. So early as the 25th year of his age, he planned a considerable part of his system of botany. He was afterwards patronized by Rudbeck junior; who being then old, entrusted Linneus with reading the botanical lectures in his place, which he did with great zeal and success. In 1732, Linneus at the expense of the Society of Sciences at Upsal, made a scientific tour to Lapland, where he encountered hunger and cold, with a variety of dangers and hardships. The plants which he found in this tour, he, in the same year, exhibited in the memoirs of the society, classed according to his own system. During this tour, he had opportunities for cultivating the art of assaying minerals; on which art, and on mineralogy, he, after his return, read lectures at Upsal. For the same scientific purposes he also made journeys to the principal Swedish mines, during which he was greatly assisted by the liberality of Mr de Reuterholm; and, after having thus enlarged his acquaintance with the state of his own native country, he, in 1735, with a very slender support, began his travels into foreign countries.

He visited Hamburg, Amsterdam, the university of Harderwyck, where he was created a doctor in physic; and then hastened to Boerhaave at Leyden, who valued and recommended him to Mr Clifford, whose natural collections at Hitecamp Linneus was to describe. At Gronovius's persuasion, he, in 1736, published the original edition of his System of Nature in Holland; and, after this, many other of his works in the same country. In the mean time Linneus came over to England. His System of Botany was first adopted by Gronovius, in his *Virginian Flora*; and his names of plants by Van Royen, in his *Prodromus*: yet, though he lived very happy in Holland, and had the most advantageous offers made him there, he left that country and went to France, where he entered into the most intimate friendship with M. Bernard Jussieu. In 1738 he returned to Stockholm, where he began with practising physic, and was appointed professor of mineralogy, and physician to the admiralty. In 1739, he married the provincial physician Moræus's daughter, to whom he had been betrothed before his departure from Sweden. His spirit and zeal were now encouraged by a variety of rewards. The Royal Academy of Sciences, established in the same year at

Linnaeus. Stockholm, chose him their first speaker. At the public expence he made tours into several provinces of the kingdom, in order to explore their respective productions. In 1741, after professor Roberg's death, he succeeded to the chair of physic at Upsal; and as he had the celebrated M. de Rosenstein for his colleague in that profession, the faculty of physic became uncommonly flourishing in that university. The botanical garden of Upsal, which had been long ago founded by Rudbeck the elder, but destroyed by a fire in 1702, and afterwards neglected, was now soon restored by Linnaeus, and in three years brought to a degree of perfection equal at least to that of any other botanical garden whatever.

In the new green house, a particular room was designed for a collection of natural curiosities, which was partly furnished by the court and wealthy individuals. Nor were the other branches of physic left unimproved by Linnaeus. His delivery in his lectures was exceedingly sprightly, and animated by a native eloquence peculiar to him; as he held them not merely for the sake of money, but inspired with a lively affection for their subjects. While his health and spirits remained, his school was always more crowded than that of any other professor; and on his botanical excursions, he was surrounded by still greater numbers of pupils. There is hardly a professor who can produce so many disciples, who, chiefly at his persuasion, have, for the enlargement of his favourite study, undertaken voyages and travels to the remotest parts of the globe. The celebrated names of Kalm, Hasselquist, Ternstroem, Torén, Oelbeck, Rolander, Loeffling, Berlin, Forkal, Solander, Thunberg, Sparrman, Rothman, with many others, such as Clas Alstroemer, Kehler, &c. who, in the pursuit of natural science, travelled through many countries of Europe, will ever do credit to Linnaeus's memory. He kept up a most extensive correspondence; every one strove to give him an early account of any new discovery made, and increase his collections, to which even many sovereign princes contributed. He was highly distinguished and favoured by the late king, the queen dowager, and the present king of Sweden, who often honoured him with their visits. No system or method of botany has ever yet been more generally adopted than his. Some noblemen of the first distinction caused a medal to be struck to his honour; and the late excellent count Tessin, who had ever been his chief patron, honoured him with another. In 1747, he had the title of *physician to the king* conferred on him: in 1753, he received the honour of knighthood of the polar star; and, in 1757, he was ennobled. In 1776, the present king of Sweden accepted his resignation of his place, and conferred on him a double pension, with a noble donation of two farms for himself and his children.—He did not live long after this period; dying in January 1778, aged 70 years and 8 months.

As to the private and personal character of this illustrious philosopher: His stature was diminutive and puny; his head large, and his hinder part very high; his look was ardent, piercing, and apt to daunt the beholder; his ear not sensible to music; his temper quick, but easily appeased; his memory good, though, in the latter period of his life, sometimes liable to

fail him; his knowledge of languages confined, yet no interesting discovery remained unknown to him. In summer, he used to sleep from ten to three o'clock; in winter, from nine to six; and instantly to cease his labours when he found himself not well disposed for them.—Both in his younger years, and in the decline of life, he was afflicted with various corporeal infirmities; and the disorder of which he died, an ulceration of the urinary bladder, was long and painful. The severity, however, even of his last illness did not interrupt the ardour of his scientific pursuits. And, to the fruits of his labours which the world already enjoy, future additions still remain to be made. Before his death he had finished the greatest part of the *Mantissa Tertia*. And, we are told, that his son, who has already given several specimens of his taste for botany, and other branches of natural history, labours hard in completing this work. After this, we are informed, that he intends to publish a large collection of plants which his father had lately received from the Cape of Good Hope, from Mutis in Mexico, from Koenig in India, and several other places. These, added to the inestimable works which he has already published, will be the most lasting monuments of a man, who, in the eyes of posterity, must be considered not only as a glory to his country, but as an ornament to the age in which he lived.

His contemporaries, however, and surviving friends, have not been neglectful in paying due marks of respect to his memory. At Upsal, a general mourning took place on the death of the man whose industry and genius had promoted the interest, and exalted the reputation, of that seminary of literature to the highest pitch. His funeral procession was attended by the whole university, as well professors as students; and the pall was supported by 16 doctors of medicine, all of whom were his own pupils. The Swedish monarch also ordered a medal to be struck to his honour; of which one side exhibits Linnaeus's bust and name; and the other, Cybele in a dejected attitude, holding in her left hand a key, and surrounded with animals and growing plants, with the legend, *Deam luctus avertit amissus*; and beneath, *Post obitum, Upsalia, d. x. Jan. MDCCCLXXVIII. Regis jubente*. But an honour never yet conferred on any other learned man in so high a degree, was still reserved to Linnaeus's memory by his king, who, in his speech from the throne, to the late assembly of the States of the kingdom, lamented Sweden's loss by the death of Linnaeus. Nor must we omit mentioning, that, at Edinburgh, Dr Hope, professor of botany, on opening his course of lectures for the ensuing summer, delivered a discourse in honour of this great master of the science which he has there cultivated with so much assiduity and success; and, at the same time, in presence of the students, he laid the foundation-stone of a monument (which has since been erected) to his memory, in the botanical garden at that place. While this monument cannot fail to suggest the merits of Linnaeus to the students, it will also be a mark of respect to his memory from one of his greatest and most sincere admirers.

LINNET, in ornithology. See FRINGILLA.—It is remarkable of this bird, that when it builds in hedges, and when in furze-bushes on heath, in both which places the nests are very common, they are made

made of very different materials. When they build in hedges, they use the slender filaments of the roots of trees, and the down of feathers and thistles; but when they build on heaths they use moss, principally for the outer part, finishing it within with such things as the place will afford. These birds will have young ones three or four times a-year, especially if they are taken away before they are able to leave the nests.

When linnets are to be taught to whistle tunes, or to imitate the notes of any other bird, they must be taken from the old one when they are not above four days old; for at this time they have no idea of the note of the old ones, and will be readily taught to modulate their voice like any thing that is most familiar to their ears, and within the compass of their throats. More care is required in feeding them when taken thus young, than when they are left in the nest till nearly fledged; but they will be reared very well upon a food half bread and half rasedef boiled and bruised: this must be given them several times a-day. It must be made fresh every day, and given them sufficiently moist, but not in the extreme. If it be in the least sour, it gripes and kills them; and if too stiff, it is as mischievous by binding them up.—They must be hung up as soon as taken from the nest, under the bird whose note they are intended to learn; or, if they are to be taught to whistle tunes, it must be done by giving them lessons at the time of feeding; for they will profit more, while young, in a few days, than in a long time afterwards, and will take in the whole method of their notes before they are able to crack hard feeds. Some have attempted to learn them to speak in the manner of the parrot or other birds; and they will arrive at some sort of perfection in it, with great pains.

**LINSEED**, the seed of the plant linum.—Lintseed bruised and steeped in water gives it very soon a thick mucilaginous nature, and communicates much of its emollient virtue to it. See **LINUM**.

**LINT**. See **FLAX**, **LINEN**, and **LINUM**.

**LINT**, in surgery, is the scrapings of fine linen, used by surgeons in dressing wounds. It is made in to various forms, which acquire different names according to the difference of their figures.—Lint made up in an oval or orbicular form is called a *pledgit*; if in a cylindrical form, or in shape of a date, or olive-stone, it is called a *doffil*.

These different forms of lint are required for many purposes; as, 1. To stop blood in fresh wounds, by filling them up with dry lint before the application of a bandage: though, if scraped lint be not at hand, a piece of fine linen may be torn into small rags, and applied in the same manner. In every large hæmorrhage the lint or rags should be first dipped in some styptic liquor, as alcohol, or oil of turpentine; or sprinkled with some styptic powder. 2. To agglutinate or heal wounds; to which end lint is very serviceable, if spread with some digestive ointment, balsam, or vulnerary liquor. 3. In drying up wounds and ulcers, and forwarding the formation of a cicatrix. 4. In keeping the lips of wounds at a proper distance, that they may not hastily unite before the bottom is well digested and healed. 5. They are highly necessary to preserve wounds from the injuries of the air.—Surgeons of former ages formed compresses of

sponge, wool, feathers, or cotton; linen being scarce: Lintstock but lint is far preferable to all these, and is at present universally used.

**LINTSTOCK**, in military affairs, a wooden staff about three feet long, having a sharp point in one end, and a sort of fork or crotch on the other; the latter of which serves to contain a lighted match, and by the former the lintstock is occasionally stuck in the ground, or in the deck of a ship during an engagement. It is very frequently used in small vessels, where there is commonly one fixed between every two guns, by which the match is always kept dry, and ready for firing.

**LINTZ**, a very handsome town of Germany, and capital of Upper Austria, with two fortified castles; the one upon a hill, the other below it. Here is a hall in which the states assemble, a bridge over the Danube, a manufacture of gunpowder, and several other articles. It was taken by the French in 1741, but the Austrians retook it in the following year. E. Long. 14. 33. N. Lat. 48. 16.

**LINTZ**, a town of Germany, in the circle of the Lower Rhine, and electorate of Cologne, subject to that elector. It is seated on the river Rhine, in E. Long. 7. 1. N. Lat. 50. 31.

**LINUM**, **FLAX**; a genus of the pentagynia order, belonging to the pentandria class of plants.

*Species.* 1. The *usitatissimum*, or common annual flax, hath a taper fibrous root; upright, slender, unbranched stalks, two feet and a half high; garnished with narrow, spear-shaped, alternate grey-coloured leaves; and the stalks divided into footstalks at top, terminated by small blue crenated flowers in June and July; succeeded by large round capsules of ten cells, containing each one seed. 2. The perenne, or perennial Siberian flax, hath a fibrous perennial root, sending up several upright, strong, annual stalks, branching four or five feet high; garnished with small, narrow, spear-shaped, alternate leaves of a dark-green colour; and terminated by umbellate clusters of large blue flowers in June, succeeded by seeds in autumn. There are 20 other species of linum, but these are the most remarkable.

*Culture.* The first species is cultivated in the fields according to the directions given under the article **FLAX**. The second sort is raised from seed in a bed or border of common garden-earth, in shallow drills six inches asunder; and when the plants are two or three inches high, thin them to the same distance; and in autumn plant them out where they are wanted.

*Uses.* The first species may justly be looked upon as one of the most valuable of the whole vegetable kingdom; as from the bark of its stalks is manufactured the lint or flax for making all sorts of linen-cloth; from the rags of the linen is made paper; and from the seeds is expressed the lintseed oil so useful in painting and other trades. The seeds themselves are esteemed an excellent emollient and anodyne: they are used externally in cataplasms, to allay the pain of inflamed tumours: internally, a slight infusion of lintseed, by way of tea, is recommended in coughs as an excellent pectoral, and of great service in pleuritis, nephritic complaints, and suppressions of urine.

**LINUS**, in classic history, a native of Colchis,

cotemporary with Orpheus, and one of the most ancient poets and musicians of Greece. It is impossible, at this distance of time, to discover whether Linus was the disciple of Orpheus, or Orpheus of Linus. The majority, however, seem to decide this question in favour of Linus. According to archbishop Usher, he flourished about 1280 B. C. and he is mentioned by Eusebius among the poets who wrote before the time of Moses. Diodorus Siculus tells us, from Dionysius of Mitylene, the historian, who was cotemporary with Cicero, that Linus was the first among the Greeks who invented verses and music, as Cadmus first taught them the use of letters. The same writer likewise attributes to him an account of the exploits of the first Bacchus, and a treatise upon Greek mythology, written in Pelasgian characters, which were also those used by Orpheus, and by Parnapides the preceptor of Homer. Diodorus says that he added the string *lichanos* to the Mercarian lyre; and ascribes to him the invention of rhythm and melody; which Suidas, who regards him as the most ancient of lyric poets, confirms. Mr Marpurge tells us, that Linus invented cat-gut strings for the use of the lyre, which, before his time, was only strung with thongs of leather, or with different threads of flax strung together. He is said by many writers to have had several disciples of great renown; among whom were Hercules, Thamyris, and, according to some, Orpheus—Hercules, says Diodorus, in learning from Linus to play upon the lyre, being extremely dull and obstinate, provoked his master to strike him; which so enraged the young hero, that, instantly seizing the lyre of the musician, he beat out his brains with his own instrument.

LION, in zoology. See FELIS.

LIONCELLES, in heraldry, a term used for several lions borne in the same coat of arms.

LIP, in anatomy. See there, n° 366. c.

*Hare-LIP*, a disorder in which the upper lip is in a manner slit or divided, so as to resemble the upper lip of a hare, whence the name. See SURGERY.

LIPARA (anc. geogr.), the principal of the islands called *Æolia*, situated between Sicily and Italy, with a cognominal town, so powerful as to have a fleet, and the other islands in subjection to it. According to Diodorus Siculus, it was famous for excellent harbours and medicinal waters. He informs us also, that it suddenly emerged from the sea about the time of Hannibal's death. The name is Punic, according to Bochart; and given it, because, being a volcano, it shone in the night. It is now called *Lipari*, and gives name to nine others in its neighbourhood; viz. Stromboli, Pare, Rotto, Panaria, Saline, Volcano, Fenicusa, Alicor, and Ustica. These are called, in general, the *Lipari Islands*. Some of these are active volcanoes at present, though Lipari is not. It is about 15 miles in circumference; and abounds in corn, figs, and grapes; bitumen, sulphur, alum, and mineral waters.

LIPARI, an ancient and very strong town, and capital of an island of the same name in the Mediterranean, with a bishop's see. It was ruined by Barbarossa in 1544, who carried away all the inhabitants into slavery, and demolished the place; but it was rebuilt by Charles V. E. Lon. 15. 30. N. Lat. 38. 35.

LIPOTHYMIA, FAINTING, may arise from several causes; as too violent exercise, suppression of the menses or other accustomed evacuations, &c. See (the *Index* subjoined to) MEDICINE.

LIPPA, a town of Hungary, with a castle. It was taken by the Turks in 1552; by the imperialists in 1688; and by the Turks again in 1691; who abandoned it in 1665, after having demolished the fortifications. It is seated on a mountain, in E. Lon. 21. 55. N. Lat. 36. 5.

LIPPE, the capital of a country of the same name in Germany, and the circle of Westphalia. It is seated on a river of the same name, and was formerly the residence of the principal branch of the house of Lippe. It is now in the possession of the king of Prussia, and carries on a good trade in preparing timber for building vessels on the Rhine, with which it has a communication by the river Lippe. The country round it is unwholesome and marshy. E. Long. 8. 12. N. Lat. 51. 43.

LIPSIUS (Justus), a learned critic, was born at Ilich, a small village near Brussels, in 1547. After having distinguished himself in polite literature, he became secretary to cardinal de Granvelle at Rome, where the best libraries were open to him; and he spent much labour in collating the MSS. of ancient authors. He lived 13 years at Leyden; during which he composed and published what he esteems his best works; but settled at Louvain, where he taught polite literature with great reputation. He was remarkable for unsteadiness in religion, fluctuating often between the Protestants and Papists; but he became finally a bigoted catholic. He died at Louvain in 1606; and his works are collected in six vols folio.

LIQUIDAMBER, SWEET-GUM-TREE; a genus of the polyandria order, belonging to the monœcia class of plants. There are two species, both of them beautiful deciduous trees, growing 30 or 40 feet high, forming fine pyramidal heads; adorned with large angular and oblong leaves, and monœcious, apetalous, saffron-coloured flowers; and producing a liquid, transparent, gummy substance, of great fragrance. They may be propagated either by seed or layers in the full ground. The seeds must be procured from America, where these trees are natives.

LIQUOR, a name for any fluid substance of the aqueous or spirituous kind.

LIQUOR of *Flints*. See CHEMISTRY, n° 338.

*Smoking LIQUOR* of *Libanum*. See CHEMISTRY, n° 247.

*Mineral Anodyne LIQUOR* of *Hoffman*. This is a composition of highly rectified spirit of wine, vitriolic ether, and a little of the dulcified oil of vitriol. It is made by mixing an ounce of the spirit of wine, which rises first in the distillation of ether, with as much of the liquor which is to be distilled, and afterwards by dissolving in the mixture which rises next, and which contains the ether, 12 drops of the oil which rises after the ether has passed. This has the same virtues with the ether, and is now generally diffused, the pure ether being substituted in its place.

LIQUORICE. See GLYCRRHIZA.

LIRIODENDRON, the TULIP-TREE; a genus of the polygynia order, belonging to the polyandria class of

Lisbon.

of plants.—There is but one species, viz. the *tulipifera*, a native of America. This rises with a large upright trunk, branching 40 or 50 feet high, having large lobed alternate leaves, of three lobes, the middle one truncated, those of the sides rounded; and from the ends of the branches bell-shaped flowers, composed of six petals in a double series, spotted with green, red, white, and yellow, appearing in July, and succeeded by large conic fruit, not ripening in this country. In the countries of North America where they are natives, these trees are known by the name of *poplar*, and grow to a great size. Mr Catesby tells us, that in Carolina some are met with of 30 feet in circumference, with irregular and unequal boughs, which distinguish them at a distance, even when they are stripped of their leaves. Their timber is of great use, particularly for making the boats called *periauges*.

LISBON, the capital of the kingdom of Portugal, situated in the province of Estremadura, on the banks of the river Tagus, in W. Long. 9. 25. N. Lat. 38. 25. It was anciently called *Olisippo*, *Olisippus*, and *Ulyssip*, which are supposed to be derived from the Phenician *Uliabbo*, or *Olisippo*, signifying, in that tongue, a *pleasant bay*, such as that on which this city stands. It first became considerable in the reign of king Emanuel; from that time it hath been the capital of the kingdom, the residence of its monarchs, the seat of the chief tribunals, and offices of the metropolis, a noble university, and the receptacle of the richest merchandize of the East and West Indies. Its air is excellent; being refreshed by the delightful sea-breezes, and those of the Tagus. The city extends for about two miles along the Tagus; but its breadth is inconsiderable. Like old Rome, it stands on seven hills: but the streets in general are narrow and dirty, and some of them are very steep; neither are they lighted at night. The churches, in general, are very fine; but the magnificence of the chapel-royal is amazing. Here is one of the finest harbours in the world; and there were a great number not only of fine churches and convents here, but also of other public buildings, and particularly of royal palaces, and others belonging to the grandees; but the greatest part of them, and of the city, were destroyed by a most dreadful earthquake, on Nov. 1, 1755, from which it will require a long time to recover. The inhabitants, before the earthquake, did not at all exceed 150,000. The government of it is lodged in a council, consisting of a president, six counsellors, and other inferior officers. The harbour has water enough for the largest ships, and room enough for 10,000 sail without being crowded. For its security, there is a fort at the mouth of the river, on each side, and a bar that runs across it, and is very dangerous to pass without pilots. Higher up, at a place where the river is considerably contracted, there is a fort called *Torre de Belem*, or the *Tower of Belem*, under whose guns all ships must pass in their way to the city; and on the other side are several more forts. Before the earthquake, most of the private houses were old and unfitly, with lattice-windows; and the number of convents and colleges amounted to 50, namely, 32 for monks, and 18 for nuns. The king's principal palace stands on the river, and is large and commodious. Of the hospitals, that called the *Great* is obliged to receive all persons, of what degree, nation, or religion

soever, without exception. At the village of Belem, near Lisbon, is a noble hospital for decayed gentlemen who have served the king, and have not wherewithal to maintain themselves. That called the *house of mercy* is also a noble charity. In the centre of the city, upon one of the highest hills, is the castle, which commands the whole, being large and ancient, and having always a garrison of four regiments of foot. The cathedral is a vast edifice of the Gothic kind, but heavy and clumsy: it contains, however, great riches, and is finely adorned within. The square called *Resio* is large, and surrounded with magnificent buildings. The whole city is under the ecclesiastical jurisdiction of the patriarch, who was appointed in the year 1717. Here is also an archbishop, who has, or at least had before the erection of the patriarchate, a revenue of 40,000 crusadoes, or 6000*l*. The university, which was removed for some time to Coimbra, but afterwards restored to its ancient seat, makes a considerable figure, though much inferior to that of Coimbra.

LISBURN, a town of Ireland, in the county of Antrim and province of Ulster. It was burnt down about 40 years ago; but is now rebuilt in a neat and handsome manner, and has a large linen manufactory. It is seated on the river Laggan, in W. Long. 6. 20. N. Lat. 54. 31.

LISIEUX, a considerable town of France, in Upper Normandy, with a bishop's see. The churches and religious houses, and the bishop's palace, are all very handsome structures. It is a trading place; and is seated at the confluence of the rivers Arbeck and Gassin, in E. Long. 0. 20. N. Lat. 49. 11.

LISLE, a large, rich, handsome, and strong town of French Flanders, of which it is the capital, with a strong castle, and a citadel built by Vauban, and said to be the finest in Europe, as well as the best fortified. The large square, and the public buildings, are very handsome; and they have manufactures of silks, cambrics, and camblets, as well as other stuffs, which have been brought to great perfection. It was taken by the duke of Marlborough, after three months siege and the loss of many thousands of men, in 1708; but restored to the French by the treaty of Utrecht, in consideration of their demolishing the fortifications of Dunkirk. It is seated on the river Duele, 14 miles west of Tournay, 32 south-west of Ghent, 37 north-west of Mons, and 130 north of Paris. E. Long. 3. 9. N. Lat. 50. 38.

LISLE (Claudius de), a learned historiographer, born at Vancouver, in 1644. He studied among the Jesuits at Pontamousson; took his degrees in law, and afterwards applied himself intirely to the study of history and geography; and to perfect himself in those sciences went to Paris, where the principal lords of the court became his scholars, and among the rest the duke of Orleans, afterwards regent of the kingdom. He wrote, 1. An historical account of the kingdom of Siam. 2. A genealogical and historical Atlas. 3. An abridgment of universal history. He died at Paris, in 1720.

LISLE (William de), son of the former, and the most learned geographer France has produced, was born at Paris in 1675. He became first geographer to the king, royal censor, and member of the academy of sciences. He died in 1726. He published a great number

Lisburn

Lise.

number of excellent maps, and wrote many pieces in the memoirs of the academy of sciences.

**LISLE** (Sir John), a brave loyalist in the time of the civil wars, was the son of a bookfeller in London, and received his education in the Netherlands. He signalized himself upon many occasions in the civil war, particularly in the last battle of Newbury; where, in the dusk of the evening, he led his men to the charge in his shirt, that his person might be more conspicuous. The king, who was an eye-witness of his bravery, knighted him in the field of battle. In 1648, he rose for his majesty in Essex; and was one of the royalists who so obstinately defended Colchester, and who died for their defence of it. This brave man having tenderly embraced the corps of Sir Charles Lucas, his departed friend, immediately presented himself to the soldiers who stood ready for his execution. Thinking that they stood at too great a distance, he desired them to come nearer: one of them said, "I warrant you, Sir, we shall hit you." He replied, with a smile, "Friends, I have been nearer you when you have missed me." He was executed August 28th 1648.

**LISMORE**, one of the Western islands of Scotland, seated at the mouth of the bay of Lochy in Argyleshire. It is eight miles long, and two broad; and the soil is pretty fertile. It was formerly the residence of the bishops of Argyle.

**LISSA**, an island in the Gulf of Venice, on the coast of Dalmatia, belonging to the Venetians, where they have a fishery of fardines and anchovies. It produces excellent wine, and is 70 miles west of Ragusa. E. Long. 17. o. N. Lat. 43. 22.

**Lissa**, a town of Poland, in the palatinate of Posen, of which it is the capital. E. Long. 16. o. N. Lat. 32. 15.

**Lissa**, a village of Silesia, 16 miles from Breslau, remarkable for a battle fought between the Prussians and the Austrians on the 15th of December 1757, when the latter were entirely defeated.

**LIST**, in commerce, the border of cloth or stuff; serving not only to shew their quality, but to preserve them from being torn in the operations of fulling, dyeing, &c.—**Lift** is used on various occasions; but chiefly by gardeners for securing their wall-trees.

**List**, in architecture, a little square moulding, otherwise called a *fillet*, *listel*, &c. See Plate XXXIX. fig. 1.

**List**, is also used, to signify the inclosed field or ground wherein the ancient knights held their jousts and combats. It was so called, as being hemmed round with pales, barriers, or stakes, as with a list. Some of these were double, one for each cavalier; which kept them apart, so that they could not come nearer each other than a spear's length. See **Joust**, **Tournament**, **Duel**, &c.

**Civil List**, in the British polity. The expences defrayed by the civil list are those that in any shape relate to civil government; as, the expences of the household; all salaries to officers of state, to the judges, and every one of the king's servants; the appointments to foreign ambassadors; the maintenance of the queen and royal family; the king's private expences, or privy-purse; and other very numerous outgoings, as secret-service money, pensions, and other bounties: which sometimes have so far exceeded the revenues appointed for that purpose, that application has been made to

parliament to discharge the debts contracted on the civil list; as particularly in 1724, when one million was granted for that purpose by the statute 11 Geo. I. c. 17. and in 1769, when half a million was appropriated to the like uses by the statute 9 Geo. III. c. 34.

The civil list is indeed properly the whole of the king's revenue in his own distinct capacity; the rest being rather the revenue of the public, or its creditors, though collected and distributed again in the name and by the officers of the crown: it now standing in the same place, as the hereditary income did formerly; and as that has gradually diminished, the parliamentary appointments have increased. The whole revenue of queen Elizabeth did not amount to more than 600,000*l.* a year: that of king Char. I. was 800,000*l.* and the revenue voted for king Charles II. was 1,200,000*l.* though complaints were made (in the first years at least), that it did not amount to so much. But it must be observed, that under these sums were included all manner of public expences; among which Lord Clarendon, in his speech to the parliament, computed, that the charge of the navy and land-forces amounted annually to 800,000*l.* which was ten times more than before the former troubles. The same revenue, subject to the same charges, was settled on king James II.: but by the increase of trade, and more frugal management, it amounted on an average to 1,500,000*l.* *per annum*, (besides other additional customs, granted by parliament, which produced an annual revenue of 400,000*l.*) out of which his fleet and army were maintained at the yearly expence of 1,100,000*l.* After the revolution, when the parliament took into its own hands the annual support of the forces both maritime and military, a civil-list revenue was settled on the new king and queen, amounting, with the hereditary duties, to 700,000*l.* *per annum*; and the same was continued to queen Anne and king George I. That of king Geo. II. was nominally augmented to 800,000*l.* \* See *Rev.* and in fact was considerably more: but that of his present majesty is expressly limited to that sum; tho' 100,000*l.* has been since added. And upon the whole, it is doubtless much better for the crown, and also for the people, to have the revenue settled upon the modern footing rather than the ancient. For the crown; because it is more certain, and collected with greater ease: for the people; because they are now delivered from the feudal hardships, and other odious branches of the prerogative. And though complaints have sometimes been made of the increase of the civil list, yet if we consider the sums that have been formerly granted, the limited extent under which it is now established, the revenues and prerogatives given up in lieu of it by the crown, the numerous branches of the present royal family, and (above all) the diminution of the value of money compared with what it was worth in the last century, we must acknowledge these complaints to be void of any rational foundation; and that it is impossible to support that dignity, which a king of Great Britain should maintain, with an income in any degree less than what is now established by parliament. See **REVENUE**.

**To List, or Enlist, Soldiers**, to retain and enroll men as soldiers, either as volunteers, or by a kind of compulsion. Persons listed must be carried within four days, but not sooner than 24 hours after, before the next justice of

of peace of any county, riding, city, or place, or chief magistrate of any city or town-corporate (not being an officer in the army); and if before such justice or magistrate they dissent from such enrolling, and return the enrolling-money, and also 20 shillings in lieu of all charges expended on them, they are to be discharged. But persons refusing or neglecting to return and pay such money within 24 hours, shall be deemed as duly listed, as if they had assented thereto before the proper magistrate; and they shall, in that case, be obliged to take the oath, or, upon refusal, they shall be confined by the officer who listed them till they do take it.

**LISTER** (Dr Martin), an eminent English physician and naturalist, was born in 1638, and educated at Cambridge. He afterwards travelled into France; and at his return practised physic at York, and afterwards at London. In 1683, he was created doctor of physic, and became fellow of the college of physicians in London. In 1698, he attended the earl of Portland in his embassy from king William III. to the court of France; of which journey he published an account at his return, and was afterwards physician to queen Anne. He also published, 1. *Historia animalium Angliæ*, quarto. 2. *Conchyliorum synopsis*, folio. 3. *Cochlearum & limacum exercitatio anatomica*, 4 vols 8vo. 4. Many pieces in the Philosophical Transactions; and other works.

**LITANY**, a solemn form of supplication to God, in which the priest utters some things fit to be prayed for, and the people join in their intercession, saying, *we beseech thee to hear us, good Lord, &c.* The word comes from the Greek *λειτουργία*, "supplication;" or *λαίτεια*, "I beseech."

At first the use of litanies was not fixed to any stated time, but were only employed as exigencies required. They were observed, in imitation of the Ninevites, with ardent supplications and fastings, to avert the threatening judgments of fire, earthquakes, inundations, or hostile invasions. About the year 400, litanies began to be used in processions, the people walking barefoot, and repeating them with great devotion; and it is pretended, that by this means, several countries were delivered from great calamities. The days on which these were used, were called *rogation days*: these were appointed by the canons of different councils, till it was decreed by the council of Toledo, that they should be used every month throughout the year; and thus by degrees they came to be used weekly on Wednesdays and Fridays, the ancient stationary days for fasting. To these days the rubric of our church has added Sundays, as being the greatest days for assembling at divine service. Before the last review of the common prayer, the litany was a distinct service by itself, and used some time after the morning prayer was over; at present it is made one office with the morning-service, being ordered to be read after the third collect for grace, instead of the intercessional prayers in the daily service.

**LITCHFIELD**, a city of Staffordshire, in England, situated in W. Long. 1. 40. N. Lat. 52. 43. It stands low, about three miles from the Trent. Its ancient name is said to have been *Licidfeld*, signifying a field of carcases, from a great number of Christians having, as it is pretended, suffered martyrdom

here in the persecution under Dioclesian. Though the bishop has his see here, yet he is denominated of Litchfield and Coventry. It is divided into two parts by a rivulet and a kind of shallow lake, over which are two causeways, with sluices. It is a long straggling place; but has some very handsome houses, and well-paved clean streets. That part on the south side of the rivulet is called the *city*, and the other the *elvy*, because it is enclosed with a wall and a deep dry ditch. The city is much the largest, and contains several public structures. The cathedral is a very magnificent structure. Its front, or portico, is hardly to be paralleled in England; and it has three spires exceeding lofty. The town is a great thoroughfare to the north-west counties; and is governed by two bailiffs, 24 burgesses, a recorder, a sheriff, a steward and other officers.

**LITERARY**, any thing belonging to LITERATURE.

**LITERARY Property, or Copy-Right.** See COPY-Right.

**LITERATURE**, LEARNING, or *Skill in Letters.*

**LITHANTHRAX**, or *Pit-Coal*, is a black or brown, laminated, bituminous substance; not very easily inflammable, but, when once inflamed, burns longer and more intensely than any other substance. Of this substance three kinds are distinguished by authors. The residuum of the first after combustion is black; the residuum of the second is spongy, and like pounce stone; and the residuum of the third is whitish ashes. Some fossil coal, by long exposure to air, falls into a greyish powder, from which alum may be extracted. Fossil coal by distillation yields, 1. a phlegm or water; 2. a very acid liquor; 3. a thin oil like naphtha; 4. a thicker oil, resembling petroleum, which falls to the bottom of the former, and which rises with a violent fire; 5. an acid concrete salt; 6. an unflammable earth remains in the retort. These constituent parts of fossil-coal are very similar to those of amber and other bitumens. For the exciting of intense heats, as of furnaces for smelting iron-ore, and for operations where the acid and oily vapours would be detrimental, as the drying of malt, fossil-coals are previously charred, or reduced to *coaks*; that is, they are made to undergo an operation similar to that by which charcoal is made. By this operation coals are deprived of their phlegm, their acid liquor, and of greatest part of their fluid oil. Coaks therefore consist of the two most fixed constituent parts, the heavy oil and the earth, together with the acid concrete salt, which though volatile is detained by the oil and earth.

**LITHARGE**, is a kind of refuse of lead, and is no other than that metal in an incipient state of vitrification either alone, or with a mixture of copper. See CHEMISTRY, n<sup>o</sup> 403.

**LITHCOW** (William), a Scotsman, whose sufferings by imprisonment and torture at Malaga, and whole travels, on foot, over Europe, Asia, and Africa, seem to raise him almost to the rank of a martyr and a hero, published an account of his peregrinations and adventures. Though the author deals much in the marvellous, the horrid account of the strange cruelties of which, he tells us, he was the subject, have, however, an air of truth. Soon after

Lithgow  
Litho-per-  
mum.

his arrival in England, from Malaga, he was carried to Theobald's on a feather-bed, that king James might be an eye-witness of his *martyred anatomy*, by which he means his wretched body, mangled and reduced to a skeleton. The whole court crowded to see him; and his majesty ordered him to be taken care of, and he was twice sent to Bath at his expence. By the king's command, he applied to Gondamor, the Spanish ambassador, for the recovery of the money and other things of value which the governor of Malaga had taken from him, and for 1000 pounds for his support. He was promised a full reparation for the damage he had sustained; but the perfidious minister never performed his promise. When he was upon the point of leaving England, Lithgow upbraided him with the breach of his word in the presence-chamber, before several gentlemen of the court. This occasioned their fighting upon the spot; and the ambassador, as the traveller oddly expresses it, had his fistula (with which disorder he was afflicted) contrabanded with his fist. The unfortunate Lithgow, who was generally condemned for his spirited behaviour, was sent to the Marshalsea, where he continued a prisoner nine months. At the conclusion of the octavo edition of his *Travels* he informs us, that, in his three voyages, "his painful feet have traced over (besides passages of seas and rivers) 36,000 and odd miles, which draweth near to twice the circumference of the whole earth." Here the marvellous seems to rise to the incredible; and to set him, in point of veracity, below Coryat, whom it is nevertheless certain that he far outwalked. His description of Ireland is whimsical and curious. This, together with the narrative of his sufferings, is reprinted in Morgan's *Pinnix Britannicus*.

**LITHIASIS, or STONE.** See (the *Index* subjoined) to MEDICINE.

**LITHONTRIPICUS**, from *λίθος*, "a stone," and *τρῑψω*, "to break;" an epithet for medicines that are said to break the stone in the bladder. Tho' the different stones that are generated in the human bladder require different solvents when out of the body; and though art hath not yet afforded a medicine which, when injected into the bladder, will, without injury thereto, dissolve the stone therein lodged; it cannot thence be concluded, that there are no lithontriptic medicines. It may be here observed, that one solvent affects one subject, but hath no effect on another; so a solvent may yet be met with that will destroy the stone, and not hurt the human body. The water into which the boiled white of egg dissolves will liquefy myrrh, but may be put into the human eye without causing any uneasiness.

Soap ley taken at first in small doses in broth that is freed from all its fat, succeeds in most cases which require an alkaline solvent. The patient may being with 20 drops, and gradually increase the dose as he is able; and by repeating it three times a-day for six, eight, or twelve months, the wished for effects often follow.

**LITHOPHYTA**, the name of Linnæus's third order of vermes. See ZOOLOGY.

**LITHOSPERMUM, GROMWELL**; a genus of the monogynia order, belonging to the pentandria class of plants. There are several species; but the only re-

markable ones are the officinale or common gromwell, and the arvense or bastard alkanet. Both these are natives of Britain; the former growing in dry gravelly soil, the latter in corn-fields.—The seeds of the first are reputed to be of service in calculous cases. Dr Grew says, that they have so much earth in their composition, that they effervesce with acids; but if this is the case, it must be attributed rather to an alkaline than an earthy quality.

**LITHOTOMY**, in surgery, the operation of cutting for the stone. See SURGERY.

**LITHUANIA**, an extensive province of Poland. By the natives it is called *Letwa*, and has Great Poland and Russia on the west; part of Muscovy on the east; Livonia, the Baltic sea, and part of Muscovy, on the north; Red Russia, Volhinia, and Padolia, on the south; and the Ukraine on the south-east. Its length is said to be about 360, and its breadth 340 miles; but it is much indented both ways. Lithuania was anciently over-run with wood; and there are still many forests in it, which yield a great deal of honey, wax, pitch, tar, and timber; and abound with wild boars, buffalos, elks, wild horses, wild asses, uri, and woodcocks. The lakes are also numerous, and well-stored with fish: but the air, by reason of these forests and lakes, is said to be thick and foggy. The country produces a great deal of buck-wheat and other corn, the pastures are luxuriant, and the flocks and herds numerous: so that, notwithstanding agriculture is much neglected, provisions are exceeding cheap, but money so scarce, that ten per cent is the common interest. The principal nobility have large estates, and live in great pomp and splendor, generally retaining some hundreds of those that are poor, in quality of domestics. The established religion is Popery; but Lutherans, Calvinists, Jews, Turks, Greeks, and Socinians, are very numerous. Lithuania was governed by its own dukes till it was united to Poland, towards the end of the 14th century, when the great duke Jagello married Hedwig, the dowager of Lewis king of Poland and Hungary. It had even dukes after that, but they were subordinate to the king; and at this day, tho' one diet serves for both countries, yet each has its peculiar laws, customs, dialect, and privileges. In a diet held at Lublin in 1569, it was more closely united to Poland than it had been before; and it was enacted, that both countries, for the future, should form but one state under the same prince. As to their courts of justice, the tenth part of what is adjudged in all real actions goes always to the judge's box, and is immediately paid in court; and in personal actions he claims half the damages given. A nobleman is only fined for murder, as in Poland. The common people here, excepting the burghers in the royal towns, and the Germans, are slaves; and, in many places, the ignorant vulgar still retain some remains of idolatry. The poor people have only Mondays to themselves; and if their lords have occasion for them even on that day, the peasant must work for himself on Sunday. If any of them is condemned to death by his lord, he must execute himself, or suffer greater cruelty. The dialect is a language of the Slavonic; and they speak here, as in Poland, a barbarous kind of Latin. Lithuania is divided into nine palatinates. Another division is into Lithuania properly so called,

Lithotom  
Lithuania

Notes  
Littleton.

Liturg  
Livadia.

ed, and Lithuanian Russia. Some also comprehend under it Samogitia and Courland, which is a fief of Poland.

LITOTES. See ORATORY, n° 55.

LITTER, a parcel of dry old straw put on the floor of a horse's stall for him to lie down and rest upon. When a horse comes tired into a stable, fresh litter has the virtue of making him stale immediately. This is known to be a very great advantage to a horse in a tired state; and when the litter is old and dirty, it never has any such effect upon him. If the owners knew how refreshing it is for a horse to discharge his urine on his return from labour, they would be more careful of giving them all means and occasions of it than they do. This staling after fatigue prevents those obstructions in the neck of the bladder or urinary passages which horses are too subject to. The bladder being often inflamed by the long retention of the heated urine in it, the creature is thus in danger of perishing.

LITTLE (William), an ancient English historian, known also by the name of *Gualelmus Neubrigenfis*, was born at Bridlington in the county of York, in the year 1136; and educated in the abbey of Newborough in the same county, where he became a monk. In his advanced years, he composed a history of England, in five books, from the Norman conquest to A. D. 1197; which for veracity, regularity of disposition, and purity of language, is one of the most valuable productions of this period.

LITTLETON (Sir Thomas), judge of the Common-pleas, was the eldest son of Thomas Westcote, esq. of the county of Devon, by Elizabeth, sole heiress of Thomas Littleton of Frankley in Worcester-shire, at whose request he took the name and arms of that family. He was educated at one of our universities, probably at Cambridge. Thence he removed to the Inner Temple, where he became one of the readers; and was afterwards, by Henry VI. made steward or judge of the court of the palace, or marshalsea of the king's household. In 1455, the thirty-third of that reign, he was appointed king's serjeant, and rode the northern circuit as judge of assize. In 1462, the second of Edward IV. he obtained a pardon from the crown; and, in 1466, was appointed one of the judges of the common-plea, and rode the Northamptonshire circuit. In the year 1475 he was, with many of the first nobility, created knight of the Bath. He died in 1481; and was buried in the cathedral church of Worcester, where a marble tomb, with his statue upon it, was erected to his memory. As to his character as a lawyer, it is sufficient to inform the reader that he was the author of the *Treatise upon Tenures*, on which Sir Edward Coke wrote a comment, well known by the title of *Coke upon Littleton*.

LITTLETON (Adam), descended from an ancient family in Shropshire, was born in 1627, educated at Westminster-school, and went to Oxford a student of Christ-church, whence he was ejected by the parliamentary visitors in 1648. Soon after, he became usher of Westminster-school, and in 1658 was made second master of Westminster-school. After the restoration he taught a school at Chelsea in Middlesex, of which church he was admitted rector in the year 1664. In 1670 he accumulated the degrees in divinity, being

then chaplain in ordinary to his majesty. In 1674 he became prebendary of Westminster, of which church he was afterward sub-dean. Before he well-known *Latin and English dictionary*, he published several other works. He died in 1694, and was interred at Chelsea. He was an universal scholar; and extremely charitable, humane, and easy of access.

LITURGY, a name given to those set forms of prayer which have been generally used in the Christian church. Of these there are not a few ascribed to the apostles and fathers, but they are almost universally believed to be spurious. The word comes from the Greek *liturgyia*, service, or public ministry.

The liturgy of the church of England was composed in the year 1547, since which time it has undergone several alterations; the last of which was in the year 1661, and of this liturgy Dr Comber gives the following character. "No church was ever blessed with so comprehensive, so exact, and so inoffensive a liturgy as ours: which is so judiciously contrived, that the whole may exercise at once their knowledge and devotion; and yet so plain, that the most ignorant may pray with understanding; so full, that nothing is omitted, which ought to be asked in public; and so particular, that it comprises most things which we would ask in private; and yet so short, as not to tire any that have true devotion. Its doctrine is pure and primitive; its ceremonies so few and innocent, that most of the Christian world agree in them: its method is exact and natural; its language significant and perspicuous, most of the words and phrases being taken out of the holy scripture, and the rest are the expressions of the first and purest ages."—And in the opinion of the most impartial and excellent Grotius, (who was no member of, nor had any obligation to, this church) "the English liturgy comes so near the primitive pattern, that none of the reformed churches can compare with it." Again, he says, "In the prayers, a scholar can discern close logic, pleasing rhetoric, pure divinity, and the very marrow of the ancient doctrine and discipline; and yet all made so familiar, that the unlearned may safely say Amen."

LITUUS, in Roman antiquity, a short, straight rod, only bending a little at one end, used by the augurs. See AUGUR.

LIVADIA, anciently *Achaia* and *Hellas*, or *Greece* properly so called; a province of Turkey in Europe, bounded on the north by Epirus and Thessaly, from which it is separated by mount Oeta, now Banina, and by the Euripus, now the strait of Negropont; on the east, by the Archipelago; on the south, by the gulf of Engia or Egina, the isthmus of Corinth, and the gulf of Lepanto; and on the west, by the Ionian sea and part of Epirus. Its extent is about 130 miles from north-west to south-east; but its greatest breadth is not above 36 miles. It is in general a mountainous country; but neither unpleasant nor unfruitful. The principal mountains are, mount Oeta in Bœotia, where is the famous pass of Thermopylae, not above 25 feet broad; and Parnassus, Helicon, and Cytheron in Phocia, which were sacred to Apollo and the muses, and consequently much celebrated by the poets. The rivers of most note are, the Sionapros, anciently the Achelous, the Cephalus, the Ifmenus, and the Alopeus. The province

*Livadia, Liver.* province is at present divided into Livadia proper, Stramulippa, and the duchy of Athens. The principal places are, Lepanto, anciently Naupactus; Livadia, anciently Libadia or Lebada; the celebrated city of Athens, now Setines; Thebes, now Stibes; Lepisna, anciently Elenus; Castri, formerly Delphi; and Megara.

**LIVADIA**, an ancient town of Turkey in Europe, and capital of a province of the same name in Greece. It is a large and populous place, seated on the gulf of Lepanto, about 25 miles from the city of that name. It has now a considerable trade in woollen stuffs and rice. Anciently it was celebrated for the oracle of Trophonius, which was in a cavern in a hill above the town. E. Long. 23. 29. N. Lat. 38. 40.

**LIVER**, in anatomy. See there, n° 357.—Plato, and other of the ancients, fix the principle of love in the liver; whence the Latin proverb, *Cogit amare jecur*: and in this sense Horace frequently uses the word, as when he says, *Si torrens jecur quæris Idoneum*.—The Greeks, from its concave figure, called it *παρα*, vaulted, suspended; the Latins call it *jecur*, q. d. *juxta cor*, as being near the heart. The French call it *foyer*, from *foyer*, *focus*, or fire-place; agreeable to the doctrine of the ancients, who believed the blood to be boiled and prepared in it.—Erasistratus, at first, called it *parenchyma*, i. e. *effusion*, or *mass* of blood: and Hippocrates, by way of eminence, frequently calls it the *hypochondrium*.

**LIVER of Antimony.** See CHEMISTRY, n° 459.

**LIVER of Arsenic**, is a combination of white arsenic with liquid fixed vegetable alkali, or by the humid way. Arsenic has in general a strong disposition to unite with alkalis. Mr Macquer, in his *Memoirs upon Arsenic*, mentions a singular kind of neutral salt, which results from the union of arsenic with the alkaline basis of nitre, when nitre is decomposed, and its acid is disengaged in close vessels, by means of arsenic. To this salt he has given the name of *neutral arsenical salt* \*. The liver of arsenic mentioned also by that chemist, although composed, like the neutral arsenical salt, of arsenic and fixed alkali, is nevertheless very different from that salt.

The operation for making liver of arsenic is easy and simple. To strong and concentrated liquid fixed alkali, previously heated, fine powder of white arsenic must be added. This arsenic easily disappears and dissolves, and as much of it is to be added till the alkali is saturated, or has lost its alkaline properties, although it is still capable of dissolving more arsenic superabundantly. While the alkali dissolves the arsenic in this operation, it acquires a brownish colour, and a singular and disagreeable smell; which, however, is not the smell of pure arsenic heated and volatilized. Lastly, this mixture becomes more and more thick, and at length of a gluey consistence. This matter is not crystallizable as the neutral arsenical salt is. It is easily decomposed by the action of fire, which separates the arsenic. This does not happen to the arsenical salt. Any pure acid is capable of separating arsenic from the liver of arsenic, in the same manner as they separate sulphur from liver of sulphur: whereas the neutral arsenical salt cannot be decomposed but by means of the united affinities of acids and metallic substances. Thus we see that arsenic may be combined with fixed

alkali in two very different manners.

The author has given to this combination the name of *liver of arsenic*, to distinguish it from the neutral arsenical salt, and in imitation of the name of the *liver of sulphur*, given to the combination of the fixed alkali with sulphur.

**LIVER of Sulphur.** See CHEMISTRY, n° 321.

**LIVER-Wort**, in botany. See LICHEN.

**LIVERPOOL**, **LITHERPOOL**, or **Lirpool**, a flourishing maritime town of Lancashire; in England, situated at the mouth of the river Mersey, which abounds with salmon, cod-fish, turbot, plaice, smelts, and boulders, and at high-water is above two miles over. The town was incorporated by king John; and is governed by a mayor, recorder, aldermen without limitation, 40 common council-men, and burgesses, the number of whom exceeds 1500. The freemen of Liverpool have the same privileges at Bristol in England, and at Waterford and Wexford in Ireland. The town is well-built, and very populous; and in commerce rivals, if it does not exceed, that of Bristol. It lies in a central situation between the coast of Wales, Ireland, Scotland, and the Isle of Man; besides its standing very convenient for an inland trade with Cheshire, Staffordshire, and other parts of the north of England. Besides the Mersey, there is the fourth channel, or river Weaver, which is navigable, and chiefly used for the inland conveyance of Cheshire cheese and rock-salt. This kind of salt is dug in Lancashire and Cheshire, and from thence sent all over England. When boiled in sea-water and evaporated, a very strong salt is produced, which may be used in curing herrings. W. Long. 2. 30. N. Lat. 53. 45.

**LIVERY**, in matters of dress and equipage, a certain colour and form of dress, by which noblemen and gentlemen choose to distinguish their servants.

**LIVERY of Seisin**, in law, signifies delivering the possession of lands, &c. to him who has a right to them.

**LIVERYMEN** of London, are a number of men chosen from among the freemen of each company. Out of this body the common-council, sheriff, and other superior officers for the government of the city, are elected; and they alone have the privilege of giving their votes for members of parliament, from which the rest of the citizens are excluded.

**LIVONIA**, a large province of the Russian empire, with the title of a duchy. It is bounded on the north by the gulf of Finland, on the west by that of Riga, on the south by Courland, and on the east, partly by Plefcow, and partly by Novogorod. It is about 250 miles from north to south, and 150 from east to west. The land is so fertile in corn, that it is called the *granary of the North*; and would produce a great deal more, if it was not so full of lakes. The fish that abound here are salmon, carps, pikes, flat fish, and many others. In the forests there are wolves, bears, elks, rein-deer, stags, and hares. The domestic animals are very numerous; but the sheep bear very bad wool. Here are a great number of forests, which consist of birch-trees, pines, and oaks; and all the houses of the inhabitants are built with wood. The merchandizes which they send abroad are flax, hemp, honey, wax, leather, skins, and potatoes. The Swedes were formerly possessed of this province, but were obliged to abandon it to the Russians after the battle of

\* See Chemistry, n° 460.

of Pultowa; and it was ceded to them by the peace of the North, concluded in 1722, which was confirmed by another treaty in 1742. It is divided into two provinces, viz. Letonia and Estonia; and two islands called *Oesel* and *Daghe*, which are again subdivided into several districts.

**LIVONICA TERRA**, a kind of fine bole used in the shops of Germany and Italy. It is found in Livonia, from whence it takes its name, and also in some other parts of the world. It is generally brought to us in little cakes, sealed with the impression of a church and an escutcheon, with two cross keys.

**LIVRE**, a French money of account, containing 20 sols. See **MONEY-Table**.

**LIXIVIOUS**, an appellation given to salts obtained from burnt vegetables by pouring water on their ashes.

**LIXIVUM**, in pharmacy, &c. a ley obtained by pouring some liquor upon the ashes of plants; which is more or less powerful, as it has imbibed the fixed salts contained in the ashes.

**LIZARD**, in zoology. See **LACERTA**.

**LIZARD**, in geography, a cape or promontory of Cornwall, situated according to the most common computation, in W. Long. 5. 47. N. Lat. 49. 50.

**LLOYD** (Nicholas), a learned English writer in the 17th century, was born in Flintshire in England, and educated at Wadham college, Oxford. He was rector of Newington St Mary near Lambeth, in Surry, till his death, which happened in 1680. His *Dictionary Historicum* is a valuable work, to which Hoffman and Moreri are greatly indebted.

**LLOYD** (William), a most learned English writer and bishop, was born in Berkshire in England, in 1627. He was educated under his father, rector of Sonning, and vicar of Tyle-hurst in Berkshire; then went to Oxford, and took orders. In 1660, he was made prebendary of Rippon; and in 1666, chaplain to the king. In 1667, he took the degree of doctor of divinity; in 1672, he was installed dean of Bangor; and in 1680, was consecrated bishop of St Asaph. He was one of the six bishops who, with archbishop Sancroft, were committed prisoners to the tower of London, for subscribing a petition to the king against distributing and publishing his declaration for liberty of conscience. Soon after the revolution he was made almoner to king William and queen Mary: in 1692, he was translated to the bishopric of Litchfield and Coventry; and in 1699, to the see of Worcester, where he sat till his death, which happened in 1717, the 91st year of his age. Dr Burnet gives him an exalted character, and his works are highly esteemed.

**LOACH**, in ichthyology. See **COBITIS**.

**LOADSTONE**. See **MAGNET**.

**LOAMS**, in natural history, are defined to be earths composed of dissimilar particles, stiff, dense, hard, and rough to the touch; not easily broke while moist, readily diffusible in water, and composed of sand and a tough viscid clay. Of these loams some are whitish and others brown or yellow.

**LOAN**, any thing given to another, on condition of return or repayment.

**Public Loans**. See **FUNDS**, and **NATIONAL Debt**.

**LOANDA**, a province of the kingdom of Angola in Africa. It is an island about 15 miles in length, and three in breadth; remarkable chiefly for the capi-

tal of Angola situated upon it, in E. Long. 12. 25. S. Lat. 8. 45. This town was built by the Portuguese in 1578, under the direction of the first Portuguese governor in these parts. It is large, populous, and pleasantly seated on the declivity of a hill near the sea-coast, and facing the south-west. The island is supplied with fresh water from wells dug in it; and which are not sunk below the depth of three feet when they are filled with excellent water. It is remarkable, however, that the water of these wells continues good only during the time of high-tide; for, as that sinks, the water becomes more and more brackish, till at last it is quite salt, almost as much as the sea itself. On the coast of this island are fished the zimbis, or shells used in several parts of Africa, instead of money; and with these shells, instead of coin, is carried on a great part of the traffic of this country.

**LOANGO**, a kingdom of Africa, extending itself about 180 geographical miles in length from south to north; that is, from cape St Catherine under the second degree of south latitude, to a small river called *Lovanda Louifas*, on the 5th degree of the same. From west to east it extends from Cape Negro on the coast of Ethiopia towards the *Buchumalean* mountains, so called on account of their vast quantity of ivory and great droves of elephants, about 300 miles. It is divided into four principal provinces, viz. those of Lovangiri, Loango-mongo, Chilongo, and Piri.

The inhabitants are very black, well-shaped, and of a mild temper. The men wear long petticoats, from the waist downwards; and have round their waist a piece of cloth, half an ell or a quarter broad, over which they wear the skin of a leopard, or some other wild beast, hanging before them like an apron. On their head they wear a cap made of grass, and quilted, with a feather a-top of it; and on their shoulder, or in their hand, they carry a buffalo's tail, or drive away the musketoes. The women's petticoats are made only of straw, about an ell square, with which they cover their privities, but leave the greatest part of their thighs and buttocks bare: the rest of their body is quite bare, except that on their legs they wear little strings of beads made of shells, and small bracelets of ivory on their arms. They anoint themselves with palm-oil, mixed with a kind of red wood reduced to powder.

This country abounds with poultry, oxen, cows, sheep, goats, elephants, tigers, leopards, civet-cats, and other animals; so that here are great quantities of elephants teeth, and fine furs, to be traded for.

The capital city, where the king resides, is called *Loango*, or *Banza-Loangeri*, and, in the language of the negroes, *Boaric*. This city is situated in 4° S. Lat. and a half, a league and a half from the sea-coast. It is a pretty large city, shaded and adorned with bananas, palm, and other trees. The king, who resides in a large palace in the middle of it, has about 1500 concubines. If any of them is surprised in adultery, she and her paramour are instantly conveyed to the top of a very high hill, whence they are hurled down headlong from the steepest place.

Every man marries as many wives here as pleases, who are obliged to get their husbands livelihood, as is the practice all along the African coast inhabited by blacks. The women therefore cultivate the land, sow and

Lobe  
//  
Lochaber.

and *resp.*, while the lazy husbands loiter away their time in idleness.

The king's revenue consists in elephants teeth, copper, and a kind of petticoats made of palm-tree leaves, and called *lavogus*: he has whole store-houses full of these *lavogus*; but his greatest riches consist in slaves of both sexes.

LOBE, in anatomy, any fleshy protuberant part, as the lobes of the lungs, the lobes of the ears, &c.

LOBELIA, CARDINAL-FLOWER; a genus of the monogamia order, belonging to the syngenesia class of plants. There is a great number of species, but only four of them are cultivated in our gardens; two of which are hardy herbaceous plants for the open ground, and two shrubby plants for the stove. They are all fibrous rooted perennials, rising with erect stalks from two to five or six feet high, ornamented with oblong, oval, spear-shaped, simple leaves; and spikes of beautiful monopetalous, somewhat ringent, five-parted flowers, of scarlet, blue, and violet colours. They are easily propagated by seeds, offsets, and cuttings of their stalks. The tender kinds require the common treatment of other exotics. They are natives of America; from which their seeds must be procured.

LOBINEAU (Guy Alexis), a Benedictine monk, born at Rennes in 1666, spent his whole life in the study of history, and the writing of several works; the principal of which are, *The history of Britany*, 2 vols folio; and *A continuation of Felibien's history of Paris*, 9 vols folio. He died in 1727.

LOBO (Rodríguez Francis), a celebrated Portuguese poet, was born at Leiria, a small town of Estramadura. He wrote an heroic poem, some eclogues, and a piece entitled *Euphrosyne*, which is the favourite comedy of the Portuguese. His works were collected and printed together in Portuguese in 1721, in folio. He flourished about 1610.

LOBO (Jerome), a famous Portuguese Jesuit, born at Lisbon, went into Ethiopia, and dwelt there for a long time. At his return he was made rector of the college of Coimbra, where he died in 1678. He wrote *An historical account of Abyssinia*, which is by some esteemed a very accurate performance.

LOBSTER, in zoology, a species of cancer. See *CANCER*.

LOCAL, in law, something fixed to the freehold, or tied to a certain place: thus, real actions are local, since they must be brought in the country where they lie; and local customs are those peculiar to certain countries and places.

LOCAL Medicines, those destined to act upon particular parts; as fomentations, epithems, vesicatories, &c.

LOCARNO, a town of Switzerland, capital of a bailiwick of the same name, seated at the north end of the lake Maggiore, near the river Magie. It carries on a great trade; and the country abounds in pastures, wine, and fruits. E. Long. 8. 41. N. Lat. 46. 6.

LOCATELLUS's BALSAM. See *PHARMACY*, n° 890.

LOCHABER, a district of the shire of Inverness in Scotland. It is bounded on the north by Badenoch, by Athol on the east, by Lorn and Braidalbin on the south, and by a mountainous ridge on the west

towards the sea-shore. It derives its name from the lake, or loch, Aber; and extends about 20 miles from east to west, and 30 from north to south. The country is barren, bleak, mountainous, and rugged. In one of the most barren parts of this country, near the mouth of the river Aber, in the centre between the West and North Highlands, stands Fort-William, with the town of Maryburgh, built upon a navigable arm of the sea, not far from the foot of a very high mountain, called *Benvein*. The town, designed as a futility for the garrison, was erected into a borough; and the fort itself was designed as a check upon the clan Cameron, who had been guilty of depredations and other irregularities. It is inhabited mostly by the Macdonalds, Camerons, and Mackintoshes; who are not the most civilized people in Scotland, though their chiefs are generally persons of education, honour, and hospitality. Macdonald of Glengary, descended in a straight line from Donald of the Isles, possessed a feat or castle in this district, which was burned to the ground, and destroyed in the year 1715, in consequence of his declaring for the pretender. The elegant house and gardens belonging to Cameron of Lochiel underwent the same fate, for the same reason, after the extinction of the rebellion in the year 1746. The cadets of these families, which have formed a kind of inferior gentry, are lazy, indigent, and uncleanly; proud, ferocious, and vindictive. The common people, though celebrated for their bravery, fidelity, and attachment to their chiefs, are counted very savage, and much addicted to rapine. They speak the Erse language, and conform to the customs we have described as peculiar to the Highlanders. They pay very little attention to any sort of commerce, but that which consists in the sale of their black cattle, and lead a sort of vagrant life among the hills; hunting, fowling, and fishing, as the seasons permit, and as their occasions require. They delight in arms, which they learn to handle from their infancy; submit patiently to discipline in the character of soldiers; and never fail to signalize themselves in the field by their sobriety, as well as their valour. While they remain in their own country, nothing can be more penurious, mean, sordid, and uncomfortable, than the way of life to which these poor people are inured, whether we consider their dress, diet, or lodging. In point of provision, they are so improvident, or ill supplied, that, before the winter is over, whole families are in danger of starving. In this emergency, they bleed their miserable cattle, already reduced to skin and bone, and eat the blood boiled with oatmeal. This evacuation, added to their former weakness, enfeebles the cows to such a degree, that, when they lie down, they cannot rise again without assistance.

LOCHIA, in midwifery, a flux from the uterus consequent to delivery. See *MIDWIFERY*.

LOCK, a well-known instrument used for fastening doors, chests, &c. generally opened by a key.

LOCKE (John), a most eminent English philosopher and writer in the latter end of the 17th century, was son of Mr John Locke of Pensford in Somersetshire, and born at Wrington near Bristol in 1632. He was sent to Christ-church in Oxford; but was highly dissatisfied with the common course of studies then pursued in the university, where nothing was taught but the Aristotelian

Lochaber  
//  
Locke.

Locke. teian philosophy; and had a great aversion to the disputes of the schools then in use. The first books which gave him a relish for philosophy, were the writings of Des Cartes: for though he did not always approve of his notions, yet he thought he wrote with great perspicuity. He applied himself with vigour to his studies, particularly to phisic, in which he gained a considerable knowledge, though he never practised it. In 1694, he went to Germany as secretary to Sir William Swan, envoy from the English court to the elector of Brandenburg and some other German princes. In less than a year, he returned to England; where, among other studies, he applied himself to that of natural philosophy, as appears from a register of the changes of the air, which he kept at Oxford from June 24. 1666, to March 28. 1667. There he became acquainted with the lord Ashley, afterwards earl of Shaftesbury, who introduced him into the conversation of some of the most eminent persons of that time. In 1670, he began to form the plan of his *Essay on Human Understanding*; but his employments and avocations prevented him from finishing it then. About this time he became a member of the Royal Society. In 1672, his patron, now earl of Shaftesbury, and lord chancellor of England, appointed him secretary of the presentations, which place he held till the earl resigned the great seal. In 1673, he was made secretary to a commission of trade, worth 500l. a-year; but that commission was dissolved in 1674. The earl of Shaftesbury being restored to favour, and made president of the council in 1679, sent for Mr Locke to London: but that nobleman did not continue long in his post, being sent prisoner to the tower; and after his discharge, retired to Holland in 1682.

Mr Locke followed his patron thither. He had not been absent from England a year, when he was accused at court of having written certain tracts against the government, which were afterward discovered to be written by another person; and in November 1684, he was deprived of his place of student in Christ-church. In 1685, the English envoy at the Hague demanded him and 83 other persons to be delivered up by the States General: upon which he lay concealed till the year following; and during this time formed a weekly assembly with Mr Limborch, Mr Le Clerc, and other learned men at Amsterdam. In 1689, he returned to England in the fleet which conveyed the prince of Orange; and endeavoured to procure his restoration to his place of student of Christ-church, that it might appear from thence that he had been unjustly deprived of it: but when he found the college would admit him only as a supernumerary student, he desisted from his claim.

Being esteemed a sufferer for revolution-principles, he might easily have obtained a more profitable post; but he contented himself with that of commissioner of appeals, worth 200l. a-year, which was procured for him by the Lord Mordaunt, afterwards earl of Monmouth, and next of Peterborough. About the same time he was offered to go abroad in a public character; and it was left to his choice, whether he would be envoy at the court of the emperor, that of the elector of Brandenburg, or any other where he thought the air most suitable to him: but he waved all these,

on account of the infirm state of his health; which disposed him gladly to accept another offer that was made by Sir Francis Masham and his lady, of an apartment in their country-seat at Oates in Essex, about 25 miles from London.

This place proved so agreeable to him in every respect, that it is no wonder he spent the greatest part of the remainder of his life at it. The air restored him almost to a miracle, in a few hours after his return at any time from the town, quite spent and unable to support himself. Besides this happiness here, he found in lady Masham a friend and companion exactly to his heart's wish; a lady of a contemplative and studious complexion, and particularly inured, from her infancy, to deep and refined speculations in theology, metaphysics, and morality. In this family Mr Locke lived with as much ease as if the whole house had been his own: and he had the additional satisfaction of seeing this lady breed up her only son exactly upon the plan which he had laid down for the best method of education; the success of which was such as seemed to give a sanction to his judgment in the choice of that method. In effect, it is to the advantage of this situation, that he derived so much strength, as to continue exerting those talents which the earl of Shaftesbury had observed to be in him for political subjects. Hence we find him writing in defence of the Revolution in one piece; and considering the great national concern at that time, the ill state of the silver-coin, and proposing remedies for it, in others. Hence he was made a commissioner of trade and plantations in 1695, which engaged him in the immediate business of the state; and with regard to the church, he published a treatise the same year, to promote the scheme which king William had much at heart, of a comprehension with the dissenters. This, however, drew him into one controversy; which was scarcely ended, when he entered into another in defence of his essay, which held till 1698: soon after which the asthma, his constitutional disorder, increasing with his years, began to subdue him; and he became so infirm, that in 1700 he resigned his seat at the board of trade, because he could no longer bear the air of London sufficient for a regular attendance upon it. After this resignation, he continued altogether at Oates; in which retirement he employed the remaining last years of his life entirely in the study of the holy Scriptures.

He died in 1704, aged 73. His writings will immortalize his name. The earl of Shaftesbury, author of the *Characteristicks*, though in one place he speaks of Mr Locke's philosophy with severity; yet observes, concerning his *Essay on the Human Understanding*, in general, "that it may qualify men as well for business and the world, as for the sciences and the universal verity." Whoever is acquainted with the barbarous state of the philosophy of the human mind, when Mr Locke undertook to pave the way to a clear notion of knowledge, and the proper methods of pursuing and advancing it, will be surprised at this great man's abilities; and plainly discover how much we are beholden to him for any considerable improvements that have been made since. His *Discourses on Government*, *Letters on Toleration*, and his *Commentaries on some of St Paul's epistles*, are justly held in the highest esteem.

Locked  
|  
Locust.

**LOCKED JAW.** See (the *Index* subjoined to) **MEDICINE.**

**LOCKMAN**, an officer in the Isle of Man, who executes the orders of government, much like our under-sheriff.

**LOCKMAN**, an eastern philosopher. See **LOKMAN.**

**LOCUS GEOMETRICUS**, denotes a line by which a local or indeterminate problem is solved.

A *locus* is a line, any point of which may equally solve an indeterminate problem. Thus, if a right line suffice for the construction of the equation, it is called *locus ad rectum*; if a circle, *locus ad circulum*; if a parabola, *locus ad parabolam*; if an ellipse, *locus ad ellipsin*; and so of the rest of the conic sections.

**LOCULAMENTA**, and **LOCULI**, in botany; cells or pockets: The internal divisions of a capsule, or other dry seed-vessel, so termed.—These cells contain or inclose the seeds; and are different in number in different plants.

The term **LOCULUS** is also sometimes used to express the minute divisions in some species of *antheræ*, which contain the fine impalpable powder supposed by the sexualists to be the principal agent in the generation of plants.

**LOCUST**, in zoology. See **GRYLLUS**, and Plate **CXL.**

The annals of most of the warm countries are filled with accounts of the devastations produced by the locusts, who sometimes make their appearance in clouds of two or three miles in length, and several yards deep. They seldom visit Europe in such swarms as formerly; yet in the warmer parts of it are still formidable.—Those which have at uncertain intervals visited Europe in our memory, are supposed to have come from Africa, and are of that species called the *great brown locust*. This insect is about three inches long, and has two horns or feelers an inch in length. The head and horns are of a brownish colour; it is blue about the mouth, as also on the inside of the larger legs. The shield which covers the back is greenish; and the upper-side of the body brown, spotted black, and the under-side purple. The upper-wings are brown, with small dusky spots, and one larger spot at the tips. The under-wings are more transparent, and of a light brown tinged with green, but there is a dark cloud of spots near the tips.

These insects are bred in the warm parts of Asia and Africa, from whence they have often taken their flight into Europe, where they committed terrible devastations. They multiply faster than any other animal in the creation, and are truly terrible in the countries where they breed. Some of them were seen in different parts of Britain in the year 1748, and great mischiefs were apprehended: but happily for us, the coldness of our climate, and the humidity of our soil, are very unfavourable to their production; so that, as they are only animals of a year's continuance, they all perish without leaving a young generation to succeed them.

When the locusts take the field, as we are assured, they have a leader at their head, whose flight they observe, and pay a strict regard to all his motions. They appear at a distance like a black cloud, which, as it approaches, gathers upon the horizon, and almost hides the light of day. It often happens, that the

husbandman sees this imminent calamity pass away without doing him any mischief; and the whole swarm proceeds onward to settle upon some less fortunate country. In those places, however, where they alight, they destroy every green thing, stripping the trees of their leaves, as well as devouring the corn and grals. In the tropical climates they are not so pernicious as in the more southern parts of Europe. In the first, the power of vegetation is so strong, that an interval of three or four days repairs the damage; but in Europe this cannot be done till next year. Besides, in their long flights to this part of the world, they are fatigued by the length of their journey, and are therefore more voracious wherever they happen to settle. But as much damage is occasioned by what they destroy, as by what they devour. Their bite is thought to contaminate the plant, and either to destroy or greatly to weaken its vegetation. To use the expression of the husbandmen, they burn whatever they touch, and leave the marks of their devastation for three or four years ensuing. When dead, they infect the air in such a manner that the stench is insupportable.—Orosius tells us, that, in the year of the world 3800, Africa was infested with a multitude of locusts. After having eaten up every thing that was green, they flew off and were drowned in the sea; where they caused such a stench as could not have been equalled by the putrefying carcases of 100,000 men.

In the year 1650, a cloud of locusts was seen to enter Russia in three different places; and from thence they spread themselves over Poland and Lithuania in such astonishing multitudes, that the air was darkened and the earth covered with their numbers. In some places, they were seen lying dead, heaped upon each other to the depth of four feet; in others, they covered the surface like a black cloth; the trees bent with their weight, and the damage which the country sustained exceeded computation.

In Barbary, their numbers are formidable, and their visits frequent. Dr Shaw was a witness of their devastations in that country in 1724. Their first appearance was in the latter end of March, when the wind had been southerly for some time. In the beginning of April, their numbers were so vastly increased, that, in the heat of the day, they formed themselves into large swarms that appeared like clouds, and darkened the sun. In the middle of May they began to disappear, retiring into the plains to deposit their eggs. In June the young brood began to make their appearance, forming many compact bodies of several hundred yards square; which afterwards marching forward, climbed the trees, walls, and houses, eating every thing that was green in their way. The inhabitants, to stop their progress, laid trenches all over their fields and gardens, which they filled with water. Some placed large quantities of heath, stubble, and such like combustible matter, in rows, and set them on fire on the approach of the locusts. But all this was to no purpose; for the trenches were quickly filled up, and the fires put out by the great numbers of swarms that succeeded each other. A day or two after one of these was in motion, others that were just hatched came to glean after them, gnawing off the young branches, and the very bark of the trees. Having  
lived

Fig. 3. Log.

Fig. 4. Log Re.

**Locust** **||** **Log.** lived near a month in this manner, they arrived at their full growth, and threw off their worm-like state, by casting their skins. To prepare themselves for this change, they fixed their hinder part to some bush or twig, or corner of a stone, when immediately, by an undulating motion used on this occasion, their heads would first appear, and soon after the rest of their bodies. The whole transformation was performed in seven or eight minutes time, after which they remained for a little while in a languishing condition; but as soon as the sun and air had hardened their wings, and dried up the moisture that remained after casting off their former sloughs, they returned to their former gregariousness, with an addition both of strength and agility. But they did not long continue in this state before they were entirely dispersed. After laying their eggs, they directed their course northward, and probably perished in the sea.

It would be endless to recount all the mischiefs which these locusts have at different times occasioned; but what induces them to take such distant flights as they are known to do, seems not easily discovered. Most probably, by reason of very dry seasons in the internal parts of Africa, they are propagated in such numbers, that the vegetables of the spot where they are produced are not sufficient for their maintenance. Thus being obliged to find out other countries, they traverse the sandy deserts; and still meeting with nothing to allure them from their flight, they proceed forward across the sea, and thus come into Europe, where they alight upon the first green pastures that occur.

**See Acri-**  
**phagi.** In some parts of the world, locusts are used as food\*. In many oriental countries they are caught in small nets provided for that purpose. They parch them over the fire in an earthen pan; and when their wings and legs are fallen off, they turn reddish, of the colour of boiled shrimps. Dampier has eat them thus prepared, and thinks them a tolerable dish. The natives of Barbary also eat them fried with salt; and they are said to taste like cray-fish.

**Locust-Eaters.** See the last article, and **ACRIDOPHAGI**.

**American Locust.** See **CICADA**.

**LOGEMENT**, in military affairs, a work made by the besiegers in some part of a fortification, (after the besieged have been driven out), to maintain it, and be covered from the enemy's fire.—When a lodgement is to be made on the glacis, covert-way, or in a breach, there must be a great provision made of fascines, sand-bags, gabions, wool-packs, &c. in the trenches; and during the action, the pioneers, under the direction of an engineer, with fascines, sand-bags, &c. should be making the lodgement, in order to form a covering, while the grenadiers are storming the covert way.

**LOG**, a machine used to measure the ship's headway, or the rate of her velocity as she advances through the sea. It is composed of a reel and line, to which is fixed a small piece of wood, forming the quadrant of a circle. The term *log* however is more particularly applied to the latter. See **NAVIGATION**.

It is usual to heave the log once every hour in ships of war and East-Indiamen; and in all other vessels, once in two hours; and if at any time of the watch,

the wind has increased or abated in the intervals, so as to affect the ship's velocity, the officer generally makes a suitable allowance for it, at the close of the watch.

**Log-Board**, a sort of table, divided into several columns, containing the hours of the day and night, the direction of the winds, the course of the ship, and all the material occurrences that happen during the 24 hours, or from noon to noon; together with the latitude by observation. From this table the different officers of the ship are furnished with materials to compile their journals, wherein they likewise insert whatever may have been omitted, or reject what may appear superfluous in the log-board.

**Log-Book**, a book into which the contents of the log-board is daily copied at noon, together with every circumstance deserving notice, that may happen to the ship, or within her cognizance, either at sea or in a harbour, &c. The intermediate divisions or watches of the log-book, containing four hours each, are usually signed by the commanding officer thereof, in ships of war or East-Indiamen. See **NAVIGATION**.

**LOGWOOD.** See **HÆMATOXYLON**.

**LOGARITHMIC CURVE.** If on the line **AN** both ways indefinitely extended, be taken **AC**, **CE**, **EG**, **GI**, **IL**, on the right hand; and also **Ag**, **gP**, **Plate CLXI.** &c. on the left, all equal to one another: and if at the points **Pg**, **A**, **C**, **E**, **G**, **I**, **L**, be erected to the right line **AN**, the perpendiculars **Ps**, **gd**, **AB**, **CD**, **EF**, **GH**, **IK**, **LM**, which let be continually proportional, and represent numbers, viz. **AB**, 1; **CD**, 10; **EF**, 100, &c. then shall we have two progressions of lines, arithmetical and geometrical: for the lines **AC**, **AE**, **AG**, &c. are in arithmetical progression, or as 1, 2, 3, 4, 5, &c. and so represent the logarithms to which the geometrical lines **AB**, **CD**, **EF**, &c. do correspond. For since **AG** is triple of the first line **AC**, the number **GH** shall be in the third place from unity, if **CD** be in the first: so likewise shall **LM** be in the fifth place, since **AL**=5 **AC**. If the extremities of the proportionals **S**, **d**, **B**, **d**, **F**, &c. be joined by right lines, the figures **SBML** will become a polygon, consisting of more or less sides, according as there are more or less terms in the progression.

If the parts **AC**, **CE**, **EG**, &c. be bisected in the points, **c**, **e**, **g**, **i**, **l**, and there be again raised the perpendiculars **cd**, **ef**, **gh**, **ik**, **lm**, which are mean proportionals between **AB**, **CD**; **CD**, **EF**, &c. then there will arise a new series of proportionals, whose terms, beginning from that which immediately follows unity, are double of those in the first series, and the difference of the terms is become less, and approach nearer to a ratio of equality, than before. Likewise, in this new series, the right lines **AL**, **Ac**, express the distances of the terms **LM**, **cd**, from unity, viz. since **AL** is ten times greater than **Ac**, **LM** shall be the tenth term of the series from unity: and because **Ac** is three times greater than **Ac**, **ef** will be the third term of the series if **cd** be the first, and there shall be two mean proportionals between **AB** and **ef**; and between **AB** and **LM** there will be nine mean proportionals. And if the extremities of the lines **Bd**, **Df**, **Fh**, &c. be joined by right lines, there will be a new polygon made, consisting of more but shorter sides than the last.

If, in this manner, mean proportionals be continual-

**Log**  
**||**  
**Logarithmic.**

**Plate CLXI.**  
**fig. 5.**

Logarithmally placed between every two terms, the number of terms at last will be made so great, as also the number of the sides of the polygon, as to be greater than any given number, or to be infinite; and every side of the polygon so lessened, as to become less than any given right line; and consequently the polygon will be changed into a curve-lined figure; for any curve-lined figure may be conceived as a polygon, whose sides are infinitely small and infinite in number. A curve described after this manner is called *logarithmical*.

It is manifest from this description of the logarithmic curve, that all numbers at equal distances are continually proportional. It is also plain, that if there be four numbers, AB, CD, IK, LM, such that the distance between the first and second be equal to the distance between the third and the fourth, let the distance from the second to the third be what it will, these numbers will be proportional. For because the distances AC, IL, are equal, AB shall be to the increment Dr, as IK is to the increment MT. Wherefore, by composition, AB : DC :: IK : ML. And, contrariwise, if four numbers be proportional, the distance between the first and second shall be equal to the distance between the third and fourth.

The distance between any two numbers, is called the *logarithm of the ratio of those numbers*: and, indeed, doth not measure the ratio itself, but the number of terms in a given series of geometrical proportionals, proceeding from one number to another, and defines the number of equal ratios by the composition whereof the ratio of numbers is known.

LOGARITHMS, are the indexes or exponents (mostly whole numbers and decimal fractions, consisting of seven places of figures at least) of the powers or roots (chiefly broken) of a given number; yet such indexes or exponents, that the several powers or roots they express are the natural numbers 1, 2, 3, 4, 5, &c. to 10 or 100000, &c. (as, if the given number be 10, and its index be assumed 1.0000000, then the 0.0000000 root of 10, which is 1, will be the logarithm of 1; the 0.301036 root of 10, which is 2, will be the logarithm of 2; the 0.477121 root of 10, which is 3, will be the logarithm of 3; the 1.612060 root of 10, the logarithm of 4; the 1.041393 power of 10, the logarithm of 11; the 1.079181 power of 10 the logarithm of 12, &c.) being chiefly contrived for ease and expedition in performing of arithmetical operations in large numbers, and in trigonometrical calculations; but they have likewise been found of extensive service in the higher geometry, particularly in the method of fluxions. They are generally founded on this consideration, that if there be any row of geometrical proportional numbers, as 1, 2, 4, 8, 16, 32, 64, 128, 256, &c. or 1, 10, 100, 1000, 10000, &c. and as many arithmetical progression numbers adapted to them, or set over them, beginning with 0,

thus,  $\begin{Bmatrix} 0, 1, 2, 3, 4, 5, 6, 7, & \text{&c.} \\ 1, 2, 4, 8, 16, 32, 64, 128, & \text{&c.} \end{Bmatrix}$   
or,  $\begin{Bmatrix} 0, 1, 2, 3, 4, & \text{&c.} \\ 1, 10, 100, 1000, 10000, & \text{&c.} \end{Bmatrix}$

then will the sum of any two of these arithmetical progressionals, added together, be that arithmetical progression which answers to or stands over the geometrical progression, which is the product of the two geometrical progressionals over which the two assumed

arithmetical progressionals stand; again, if those arithmetical progressionals be subtracted from each other, the remainder will be the arithmetical progression standing over that geometrical progression which is the quotient of the division of the two geometrical progressionals belonging to the two first assumed arithmetical progressionals; and the double, triple, &c. of any one of the arithmetical progressionals, will be the arithmetical progression standing over the square, cube, &c. of that geometrical progression which the assumed arithmetical progression stands over, as well as the  $\frac{1}{2}$ ,  $\frac{1}{3}$ , &c. of that arithmetical progression will be the geometrical progression answering to the square root, cube root, &c. of the arithmetical progression over it; and from hence arises the following common, tho' lame and imperfect definition of logarithms, viz. "That they are so many arithmetical progressionals, answering to the same number of geometrical ones." Whereas, if any one looks into the tables of logarithms, he will find, that these do not all run on in an arithmetical progression, nor the numbers they answer to in a geometrical one; these last being themselves arithmetical progressionals. Dr Wallis, in his History of Algebra, calls logarithms the indexes of the ratios of numbers to one another. Dr Halley, in the Philosophical Transactions, n<sup>o</sup> 216, says, they are the exponents of the ratios of unity to numbers. So also Mr Cotes, in his *Harmonia Mensurarum*, says, they are the numerical measures of ratios. But all these definitions convey but a very confused notion of logarithms. Mr Maclaurin, in his Treatise of Fluxions, has explained the nature and genesis of logarithms agreeably to the notion of their first inventor Lord Napier. Logarithms then, and the quantities to which they correspond, may be supposed to be generated by the motion of a point; and if this point moves over equal spaces in equal times, the line described by it increases equally.

Again a line decreases proportionably, when the point that moves over it describes such parts in equal times as are always in the same constant ratio to the lines from which they are subducted, or to the distances of that point, at the beginning of those lines, from a given term in that line. In like manner, a line may increase proportionably, if in equal times the moving point describes spaces proportional to its distances from a certain term at the beginning of each time. Thus, in Plate the first case, let  $ac$  be to  $ao$ ,  $cd$  to  $co$ ,  $de$  to  $do$ ,  $ef$  to  $eo$ ,  $fg$  to  $fo$ , always in the same ratio of QR to QS; <sup>CL. X. 11. fig. 3.</sup> and suppose the point P sets out from  $a$ , describing  $ac$ ,  $cd$ ,  $de$ ,  $ef$ ,  $fg$ , in equal parts of the time; and let the space described by P in any given time be always in the same ratio to the distance of P from  $oa$  at the beginning of that time; then will the right line  $ao$  decrease proportionably.

In like manner, the line  $oa$ , (*ibid.* n<sup>o</sup> 3.) increases proportionably, if the point  $p$ , in equal times, describes the spaces  $ac$ ,  $cd$ ,  $de$ ,  $ef$ , &c. so that  $ac$  is to  $ao$ ,  $cd$  to  $co$ ,  $de$  to  $do$ , &c. in a constant ratio. If we now suppose a point P describing the line AG (*ibid.* n<sup>o</sup> 4.) with an uniform motion, while the point  $p$  describes a line increasing or decreasing proportionally, the line AP, described by P, with this uniform motion, in the same time that  $oa$ , by increasing or decreasing proportionally, becomes equal to  $op$ , is the logarithm of  $op$ . Thus AC, AD, AE, &c. are the logarithms of

Logarithms logarithm of 9 double the logarithm of 3. So, also having found the logarithms of 13, 17, and 19, and also of 23 and 29, they did easily get those of all the numbers between 10 and 30, by addition and subtraction only; and so having found the logarithms of other prime numbers, they got those of other numbers compounded of them.

But since the way above hinted at, for finding the logarithms of the prime numbers, is so intolerably laborious and troublesome, the more skilful mathematicians that came after the first inventors, employing their thoughts about abbreviating this method, had a vastly more easy and short way offered to them for the contemplation and mensuration of hyperbolic spaces contained between the portions of an asymptote, right lines perpendicular to it, and the curve of the hyperbola: for if ECN (Plate CLXI. fig. 6. n<sup>o</sup> 1.) be an hyperbola, and AD, AQ, the asymptotes, and AB, AP, AQ, &c. taken upon one of them, be represented by numbers, and the ordinates BC, PM, QN, &c. be drawn from the several points B, P, Q, &c. to the curve, then will the quadrilinear spaces BCMP, PMNQ, &c. viz. their numerical measures, be the logarithms of the quotients of the division of AB by AP, AP by AQ, &c. since, when AB, AP, AQ, &c. are continual proportions, the said spaces are equal, as is demonstrated by several writers concerning conic sections.

Having said that these hyperbolic spaces, numerically expressed, may be taken for logarithms, we shall next give a specimen, from the great Sir Isaac Newton, of the method how to measure these spaces, and consequently of the construction of the logarithms.

Let CA (*ibid.* n<sup>o</sup> 2.) = AF be = 1, and AB = Ab = x; then will  $\frac{1}{1+x}$  be = BD, and  $\frac{1}{1-x}$  be = bd; and putting

these expressions into serieses, it will be  $\frac{1}{1+x} = 1 - x + x^2$

$-x^3 + x^4 - x^5$ , &c. and  $\frac{1}{1-x} = 1 + x + x^2 + x^3 + x^4 + x^5$ , &c.

and  $\frac{x}{1+x} = x - x^2 + x^3 - x^4 + x^5 - x^6$ , &c. and  $\frac{x}{1-x} = x + x^2 + x^3 + x^4 + x^5 + x^6$ , &c. and taking the fluents, we shall have the area AFDB =  $\frac{xx}{2} + \frac{x^3}{3} - \frac{x^4}{4} + \frac{x^5}{5}$ , &c. and the area AFdb =  $\frac{xx}{2} + \frac{x^3}{3} + \frac{x^4}{4} + \frac{x^5}{5}$ , &c.

and the sum bd DB =  $2x + \frac{2x^3}{3} + \frac{2x^5}{5} + \frac{2x^7}{7} + \frac{2x^9}{9}$ , &c.

Now, if AB or ab be  $\frac{1}{10} = x$ , CB being = 0.9, and CB = 1.1, by putting this value of x in the equations above, we shall have the area bd DB = 0.2006706954621511, for the terms of the series will stand as you see in this table.

0.2000000000000000	= first	Term of the series.
6666666666666666	= second	
4000000000000000	= third	
285714.86	= fourth	
2222222	= fifth	
18182	= sixth	
154	= seventh	
1	= eighth	

0.2006706954621511

If the parts Ad and AD of this area be added separately, and the lesser DA be taken from the greater dA, we shall have  $Ad - AD = x^2 + \frac{x^4}{2} + \frac{x^6}{3} + \frac{x^8}{4} = 0.0100503358535014$ , for the terms reduced to decimals will stand thus:

0.0100000000000000	= first	Term of the series.
5000000000000000	= second	
3333333333	= third	
2500000000	= fourth	
2000000	= fifth	
1667	= sixth	
14	= seventh	

0.0100503358535014

Now if this difference of the areas be added to, or subtracted from their sum before found, half the aggregate, viz. 0.1053605156578263 will be the greater area Ad, and half the remainder, viz. 0.0953101798043249, will be the lesser area AD.

By the same tables, these areas Ad and Ad, will be obtained also when AB = Ab are supposed to be  $\frac{1}{100}$  or CB = 1.01, and CB = 0.99, if the numbers are but duly transferred to lower places, as

0.0200000000000000	= first	term of the series.
6666666666	= second	
4000000	= third	
28	= fourth	

Sum = 0.0200006667066694 = area bB.

0.0001000000000000	= first	term of the series.
5000000000	= second	
3333	= third	

0.000100050003333 = area Ad · AD.

Half the aggregate 0.0100503358535014 = Ad, and half the remainder, viz. 0.009950338531681 = AD.

And so putting AB = Ab =  $\frac{1}{1000}$  or CB = 1.001 and CB = 0.999, we obtain Ad = 0.00100050003335855, and AD = 0.00099950013330835.

After the same manner, if AB = Ab, be = 0.2, or 0.02, or 0.002, these areas will arise.

Ad = 0.2231435513142097, and AD = 0.182321557693546, or Ad = 0.0202027073175194, and AD = 0.1098026272961797, or Ad = 0.002002, and AD = 0.001.

From these areas thus found, others may be easily had from addition and subtraction only. For since  $\frac{1.2}{0.8} \times \frac{1.2}{0.9}$

= 2, the sum of the areas belonging to the ratios  $\frac{1.2}{0.8}$  and  $\frac{1.2}{0.9}$  (that is, insisting upon the parts of the absciss 1.2, 0.8; and 1.2, 0.9) viz.

AD = 0.18232, &c. 0.405465, &c. and  $\left\{ \begin{array}{l} AD = 0.18232, \&c. \\ AD = 0.10536, \&c. \end{array} \right.$

Sum = 0.28768, &c. added thus,  $\left\{ \begin{array}{l} 0.40546, \&c. \\ 0.28768, \&c. \end{array} \right.$

Total = 0.69314, &c. = the area of AFHG, when CG is = 2. Also, since  $\frac{1.2}{0.8} \times 2 = 3$ , the sum 1.0986122,

1.0986122, &c. of the areas belonging to  $\frac{1.2}{0.8}$ , and 2, will be the area of AFGH, when CG=3. Again, since  $\frac{2 \times 2}{0.8} = 5$ , and  $2 \times 5 = 10$ ; by adding  $Ad = 0.2231$ , &c.  $AD = 0.1823$ , &c. and  $Ad = 0.1053$ , &c. together, their sum is 0.5108, &c. and this added to 1.0986, &c. the area of AFGH, when CG=3. You will have 1.609379124341004 = AFGH, when CG is 5; and adding that of 2 to this, gives 2.3025850929940457 = AFGH, when CG is equal to 10: and since  $10 \times 10 = 100$ , and  $10 \times 100 = 1000$ , and  $\sqrt{5 \times 10 \times 0.98} = 7$ , and  $10 \times 1.1 = 11$ , and  $\frac{1000 \times 1.091}{7 \times 11} = 13$ , and  $\frac{1000 \times 0.98}{2} =$

499, it is plain that the area AFGH may be found by the composition of the areas found before, when CG=100, 1000, or any other of the numbers above mentioned; and all these areas are the hyperbolic logarithms of those several numbers.

Having thus obtained the hyperbolic logarithms of the numbers 10, 0.98, 0.99, 1.01, 1.02; if the logarithms of the four last of them be divided by the hyperbolic logarithm 2.3025850, &c. of 10, and the index 2, be added; or, which is the same thing, if it be multiplied by its reciprocal 0.434294481903 518, the value of the subtangent of the logarithmic curve, to which Briggs's logarithms are adapted, we shall have the true tabular logarithms of 98, 99, 100, 101, 102. These are to be interpolated by ten intervals, and then we shall have the logarithms of all the numbers between 980 and 1020; and all between 980 and 1000, being again interpolated by ten intervals, the table will be as it were constructed. Then from these we are to get the logarithms of all the prime numbers, and their multiples less than 100, which may be done by

addition and subtraction only; for  $\frac{\sqrt{84 \times 1020}}{9945} = 2$ ;  
 $\frac{\sqrt{8 \times 9963}}{984} = 3$ ;  $\frac{10}{2} = 5$ ;  $\frac{\sqrt{98}}{2} = 7$ ;  $\frac{99}{9} = 11$ ;  $\frac{1001}{7 \times 11} = 13$ ;  
 $\frac{102}{6} = 17$ ;  $\frac{988}{4 \times 13} = 19$ ;  $\frac{9936}{16 \times 27} = 23$ ;  $\frac{986}{2 \times 17} = 29$ ;  $\frac{992}{32} = 31$ ;  
 $\frac{999}{27} = 37$ ;  $\frac{984}{24} = 41$ ;  $\frac{989}{23} = 43$ ;  $\frac{987}{21} = 47$ ;  
 $\frac{9911}{11 \times 17} = 53$ ;  $\frac{9971}{13 \times 13} = 59$ ;  $\frac{9882}{2 \times 81} = 61$ ;  $\frac{9949}{3 \times 49} = 67$ ;  
 $\frac{994}{14} = 71$ ;  $\frac{9928}{8 \times 17} = 73$ ;  $\frac{9954}{7 \times 18} = 79$ ;  $\frac{996}{12} = 83$ ;  $\frac{9968}{7 \times 16} = 89$ ;  
 $\frac{9894}{6 \times 17} = 97$ ; and thus having the logarithms of all the numbers less than 100, you have nothing to do but interpolate the several terms, through ten intervals.

Now the void places may be filled up by the following theorem. Let  $n$  be a number, whose logarithm is wanted; let  $x$  be the difference between that and the two nearest numbers, equally distant on each side, whose logarithms are already found; and let  $d$  be half the difference of their logarithms: then the required logarithm of the number  $n$ , will be had by adding  $d + \frac{dx}{2n} + \frac{dx^3}{12n^3}$ , &c. to the logarithm of the lesser number; for if the numbers are represented by  $Cp$ , CG, CP, (*ibid.* n° 2.) and the ordinates  $p_1$ , PQ, be raised; if  $n$  be wrote for

CG, and  $x$  for GP, or  $Cp$ , the area  $p_1QP$ , or  $\frac{2x}{n} + \frac{x^3}{2n^3}$ , &c. will be to the area  $p_1HG$ , as the difference between the logarithms of the extreme numbers, or 2  $d$ , is to the difference between the logarithms of the lesser, and of the middle one; which, therefore, will be  $\frac{dx}{n} + \frac{dx^3}{2n^3} + \frac{dx^5}{3n^5}$ , &c.  $= d + \frac{dx}{2n} + \frac{dx^3}{12n^3}$ , &c.

The two first terms  $d + \frac{dx}{2n}$  of this series, being sufficient for the construction of a canon of logarithms, even to 14 places of figures, provided the number, whose logarithm is to be found, be less than 1000; which cannot be very troublesome, because  $x$  is either 1 or 2: yet it is not necessary to interpolate all the places by help of this rule, since the logarithms of numbers, which are produced by the multiplication or division of the number last found, may be obtained by the numbers whose logarithms were had before, by the addition or subtraction of their logarithms. Moreover, by the difference of their logarithms, and by their second and third differences, if necessary, the void places may be supplied more expeditiously; the rule foregoing being to be applied only where the continuation of some full places is wanted, in order to obtain these differences.

By the same method rules may be found for the intercalation of logarithms, when of three numbers the logarithm of the lesser and of the middle number are given, or of the middle number and the greater; and this although the numbers should not be in arithmetical progression. Also by pursuing the steps of this method, rules may be easily discovered for the construction of artificial lines and tangents, without the help of the natural tables. Thus far the great Newton, who says, in one of his letters to Mr Leibnitz, that he was so much delighted with the construction of logarithms, at his first setting out in those studies, that he was ashamed to tell to how many places of figures he had carried them at that time: and this was before the year 1666; because, he says, the plague made him lay aside those studies, and think of other things.

Dr Keil, in his Treatise of Logarithms, at the end of his Commandine's Euclid, gives a series, by means of which may be found easily and expeditiously the logarithms of large numbers. Thus, let  $z$  be an odd number, whose logarithm is sought: then shall the numbers  $z-1$  and  $z+1$  be even, and accordingly their logarithms, and the difference of the logarithms will be had, which let be called  $y$ . Therefore, also the logarithm of a number, which is a geometrical mean between  $z-1$  and  $z+1$ , will be given, viz. equal to half the sum of the logarithms.

Now the series  $y \times \frac{1}{4z} + \frac{1}{24z^3} + \frac{181}{15120z^7} + \frac{2320029}{13}$ , &c. shall be equal to the logarithm of the ratio, which the geometrical mean between the numbers  $z-1$  and  $z+1$ , has to the arithmetical mean, viz. to the number  $z$ . If the number exceeds 1000, the first term of the series, viz.  $\frac{y}{4z}$ , is sufficient for producing the

L O G [ 4260 ] L O G

Logarithms logarithm to 13 or 14 places of figures, and the second term will give the logarithm to 20 places of figures. But if  $z$  be greater than 10000, the first term will exhibit the logarithm to 18 places of figures; and so this series is of great use in filling up the chilids omitted by Mr Briggs. For example, it is required to find the logarithm of 20001; the logarithm 0.00000000542813; and if the logarithm of the geometrical mean, viz. 4.301051709302416 be added to the quotient, the sum will be

4.301051709845230 = the logarithm of 20001.

Wherefore it is manifest, that to have the logarithm to 14 places of figures, there is no necessity of continuing out the quotient beyond 6 places of figures. But if you have a mind to have the logarithm to 10 places of figures only, the two first figures are enough. And if the logarithms of the numbers above 20000 are to be found by this way, the labour of doing them will mostly consist in setting down the numbers. This series is easily deduced from the consideration of the hyperbolic spaces aforesaid. The first figure of every logarithm towards the left hand, which is separated from the rest by a point, is called the *index of that logarithm*; because it points out the highest or remotest place of that number from the place of unity in the infinite scale of proportionals towards the left hand: thus, if the index of the logarithm be 1, it shews that its highest place towards the left hand is the tenth place from unity; and therefore all logarithms which have 1 for their index, will be found between the tenth and hundredth place, in the order of numbers. And for the same reason all logarithms which have 2 for their index, will be found between the hundredth and thousandth place, in the order of numbers, &c. Whence universally the index or characteristic of any logarithm is always less by one than the number of figures in whole numbers, which answer to the given logarithm; and, in decimals; the index is negative.

As all systems of logarithms whatever, are composed of similar quantities, it will be easy to form, from any system of logarithms, another system in any given ratio; and consequently to reduce one table of logarithms into another of any given form. For as any one logarithm in the given form, is to its correspondent logarithm in another form; so is any other logarithm in the given form, to its correspondent logarithm in the required form; and hence we may reduce the logarithms of lord Napier into the form of Briggs's, and contrariwise. For as 2.302585092, &c. lord Napier's logarithm of 10, is to 1.0000000000 Mr Briggs's logarithm of 10; so is any other logarithm in lord Napier's form, to the correspondent tabular logarithm in Mr Briggs's form: And because the two first numbers constantly remain the same; if lord Napier's logarithm of any one number be divided by 2.302585, &c. or multiplied by 4342944, &c. the ratio of 1.00000, &c. to 2.30258, &c. as is found by dividing 1.00000, &c. by 2.30258, &c. the quotient in the former, and the product in the latter, will give the correspondent logarithm in Briggs's form, and the contrary. And, after the same manner, the ratio of natural logarithms to that of Briggs's will be found = 86858896306.

#### The Use and Application of LOGARITHMS.

It is evident, from what has been said of the con-

of 20000 is the same as the logarithm of 2, with Logarithms the index 4 prefixed to it; and the difference of the logarithms of 20000 and 20001, is the same as the difference of the logarithms of the numbers 10000 and 10001, viz. 0.0000434272, &c. And if this difference be divided by 4z, or 80004, the quotient  $\frac{y}{4z}$  shall be

of 20000 is the same as the logarithm of 2, with Logarithms the index 4 prefixed to it; and the difference of the logarithms of 20000 and 20001, is the same as the difference of the logarithms of the numbers 10000 and 10001, viz. 0.0000434272, &c. And if this difference be divided by 4z, or 80004, the quotient  $\frac{y}{4z}$  shall be

fruition of logarithms, that addition of logarithms must be the same thing as multiplication in common arithmetick; and subtraction in logarithms the same as division: therefore, in multiplication by logarithms, add the logarithms of the multiplicand and multiplier together, their sum is the logarithm of the product.

Example.	Multiplicand	8.5	0.1294189
	Multiplier	10	1.0000000
	Product	85	1.9294189

And in division, subtract the logarithm of the divisor from the logarithm of the dividend, the remainder is the logarithm of the quotient.

Example.	Dividend	9712.8	3.9873444
	Divisor	456	2.6589648
	Quotient	21.3	1.3283796

#### To find the Complement of a LOGARITHM.

Begin at the left hand, and write down what each figure wants of 9, only what the last significant figure wants of 10; so the complement of the logarithm of 456, viz. 2.6589648, is 7.3410352.

In the rule of three. Add the logarithms of the second and third terms together, and from the sum subtract the logarithm of the first, the remainder is the logarithm of the fourth. Or, instead of subtracting a logarithm, add its complement, and the result will be the same.

#### To raise Powers by LOGARITHMS.

Multiply the logarithm of the number given, by the index of the power required; the product will be the logarithm of the power sought.

Example. Let the cube of 32 be required by logarithms. The logarithm of 32 = 1.5051500, which multiplied by 3, is 4.5154500, the logarithm of 32768, the cube of 32. But in raising powers, viz. squaring, cubing, &c. of any decimal fraction by logarithms, it must be observed, that the first significant figure of the power be put in many places below the place of units, as the index of its logarithm wants of 10, 100, &c. multiplied by the index of the power.

#### To extract the Roots of Powers by LOGARITHMS.

Divide the logarithm of the number by the index of the power, the quotient is the logarithm of the root sought.

#### To find mean Proportionals between any two numbers.

Subtract the logarithm of the least term from the logarithm of the greatest, and divide the remainder by a number more by one than the number of means de-

Logarithms defined; then add the quotient to the logarithm of the least term (or subtract it from the logarithm of the greatest) continually, and it will give the logarithms

of all the mean proportionals required. Example. Let three mean proportionals be sought, between 106 and 100.

$$\text{Logarithm of } 106 = 2.0253058$$

$$\text{Logarithm of } 100 = 2.0000000$$

$$\text{Divided by } 4) 0.0253059 (0.0063264.75$$

Logarithm of the least term 100 added

2.0000000

Logarithm of the first mean 101.4673846

2.0063264.75

Logarithm of the second mean 102.9563014

2.0126529.5

Logarithm of the third mean 104.4670483

2.0189794.25

Logarithm of the greatest term 106

2.0253059.

The following method, communicated by Mr Thomas Atkinson, Esq. of Ballyshannon, Ireland, is much more expeditious and easy.

In any series of numbers in a geometrical progression, beginning from unity, as in the margin, the series is composed of a set of continued proportionals, of which the member standing nearest to unity is the common ratio or rate of the proportion. If over or under these another series is placed, as in the example, of numbers in an arithmetical progression, beginning with nought, and whose common difference is unity, the members of this series are called *indexes*; for they serve to show how many successive multiplications have been made with the common rate to produce that member of the geometrical progression over which each of these indexes does severally stand.

This theory may be considered in another light. If the square root of 10 (that is, of the common rate) is found, it is a mean proportional between 1 and 10, and becomes a new common rate for a new set of continued proportionals, as in

0 .5 1 1.5 2 2.5  
1 3.16 10 31.6 100 316

the margin. And if the half of unity, which in the former case was the additional difference of the arithmetical progression, is made the additional difference of this new series, and noted as in the example, a new combination is formed of two series agreeing with the first in these remarkable properties, viz. If any two members of the geometrical progression are multiplied together, the sum of their corresponding indexes will become the index of their product; and conversely, if any one of them is divided by any other, the difference of their indexes will be found to be the index of the quotient. This theory is indefinite; and repeated extractions may be made with any proposed number of decimals, and bisection made of the corresponding indexes, until one has no more number to work with; and each of the mean proportionals thus found between 1 and 10, will be found a member of every new geometrical progression formed by every smaller root; and consequently all the roots thus found, together with their corresponding indexes, have,

in cases of multiplication or division, the same connection, as has been just described.

Let those successive roots be found, and noted in the form of a table, and, in another column, let the corresponding indexes found by these directions be regularly noted, each opposite to its own roots. These indexes are commonly known by the denomination of *logarithms*; the roots themselves may be called *natural numbers*.

These roots are composed of natural numbers seldom or never wanted; but from them the logarithms of such as are of general use may be thus found.

Suppose 2 the proposed number, one must examine the table of roots; there he will find 3.16, &c. &c. the nearest to 2 of those which are greater; and 1.778, &c. &c. also nearest to it of those which are less. He may make a division at his pleasure, either  $\frac{3.16}{2}$  or

$\frac{2}{1.77}$ ; yet let the choice fall on what will yield the

smallest quotient, and let the

circumstances of the calculation be noted, as in the margin, for future direction. Here

$\frac{2}{1.77} = 1.1246$ . With this quotient let the table be applied to as before, and 1.1246, &c. will be found to be between 1.154, &c. &c. and 1.074, &c. &c. and division to be made as in the example. In this manner one is to proceed with each successive quotient, till at length he has one in which the number of the initial decimal noughts is equal at least, if not greater than that of the significant figures. Here the work of division may be discontinued; and as it will rarely happen, that one will not have an additional initial nought for every division, the number cannot be great in calculations of a moderate extent. Having at last found a quotient such as was described, and supposing the number of decimals to be 10, one may readily find the logm. of that quotient thus:—Suppose the quotient 1.000057968; he is to look into the table of roots for those noted with 5 initial decimal noughts, and from any one of these and its corresponding logm. state thus:

.0000087837, &c. 0000038147 its logm. &c. 0000057968 of the quotient.

.0000025175, its logm.

Thus knowing that 0.000025175, or such like, is the logm. of the last quotient, one may have that of 2, if he will but call to mind the following circumstances.

In every case of division, if he has logarithms of quotient and divisor, he has also that of the dividend, by adding the two first together: if he has the logarithm of the dividend, and that of either the divisor

or

*Logarithms* or quotient, he may find that of the other; for he has only to subtract what he knows from the logarithm of the dividend, the remainder is what he wants. and lastly, that in every division he made, he took one number from the table of roots whose logarithm is known, being noted in the table, and which he made use of as his direction either as a dividend or a divisor: From these circumstances, one may, by the help of the logarithm just found, discover the logarithm of that number of the last division, whether it be dividend or divisor, which was the quotient of the preceding division; and thus, tracing his own work backwards by his notes from quotient to quotient, be they ever so few or ever so many, he will come at last by addition and subtraction to the logarithm of the proposed number.

By this method, the logarithm of any number within the compass of the table of roots may be found: if a greater is proposed, suppose 9495, it must be made 9.495, and its logarithm found; then it must be restored to the proposed form, and have a proper index noted before the decimals just found. How to do this is too well known to have occasion to mention it here.

—3.301029995664 the logarithm of the fraction given.  
7 the power to which it is to be raised.

—19.107209969648 the logarithm of the answer.

This differs from the like work in whole numbers only in this, that, in multiplying the decimals, one has at last 2 to be carried from them to the whole numbers; this is to be considered as +2, then  $-3 \times 7 = -21$ , and  $-21 + 2 = -19$  to be noted the index of the answer. Extraction of the roots is only the converse of this. Suppose  $-19.107209969648$  given, to find that root whose exponent number is 7. As 7 is the exponent number here, one may in his mind multiply it by 2 for a trial, as in common divi-

Another EXAMPLE.

Suppose  $-1.4771212545$  given, to extract the root of its 5th power.  
 $-1.8954252109$  the logarithm of the root.

For 5, the exponent of the root  $\times 1$  is greater than the index of the given logarithm, and 4 is the remainder. Then  $-1$  becomes the index of the logarithm

The reason for finding the logarithm of the last quotient by the common proportion is this: He who has made a table of roots, will find, by inspection only, that as initial noughts come into the decimal parts of the roots, the significant figures just immediately following them do assume the form of a geometrical progression, descending, whose common rate or divisor is 2, as is just the case with the whole of the decimals of the corresponding logarithms; and that the number of the significant figures endowed with this property is generally equal to that of the initial noughts: so far as this, and no farther, the common proportion will hold between the significant figures of the decimals in the roots and the same number of places in the logarithms; and for this reason it was needful to continue the successive divisions till a quotient was found so circumstanced, that its logarithm could be found by the proportion.

The same gentleman hath also favoured us with the following new method

*Of extracting Roots of Fractions by LOGARITHMS.*

The easiest way to explain this, is first to give an example of involving such numbers.

tion; but the product  $= 14$  being less than 19, must be rejected; then he may try it  $-19.107209969648$  with 3, this yields 21 for a product. This 3 must be noted with a negative sign for the index of the new logarithm. Then, on comparing 19 with 21, the difference is 2. This 2 must be carried as 20 to the decimals, and one must from that carry on the division of the decimals with 7 for a divisor, as is usually done in other cases.

of the root; and  $4 =$  the overplus, is to be carried as 40 to the decimals; and from that, division is to be made with 5 as a divisor for the rest of the work.

## L O G I C,

THE art of thinking and reasoning justly; or, it may be defined the science or history of the human mind, inasmuch as it traces the progress of our knowledge from our first and most simple conceptions through all their different combinations, and all those numerous deductions that result from variously comparing them one with another.

The precise business of logic, therefore, is to explain the nature of the human mind, and the proper manner of conducting its several powers, in order to the attainment of truth and knowledge. It lays open those errors

and mistakes we are apt, through inattention, to run into; and teaches us how to distinguish between truth, and what only carries the appearance of it. By this means we grow acquainted with the nature and force of the understanding; see what things lie within its reach; where we may attain certainty and demonstration; and when we must be contented with probability.

This science is generally divided into four parts, viz. *Perception, Judgment, Reasoning, and Method*. This division comprehends the whole history of the sensations and operations of the human mind.

P A R T I.  
OF PERCEPTION.

WE find ourselves surrounded with a variety of objects, which acting differently upon our senses, convey distinct impressions into the mind, and thereby rouse the attention and notice of the understanding. By reflecting too on what passes within us, we become sensible of the operations of our own minds, and attend to them as a new set of impressions. But in all this there is only bare *consciousness*. The mind, without proceeding any farther, takes notice of the impressions that are made upon it, and views things in order, as they present themselves one after another. This attention of the understanding to the object acting upon it, whereby it becomes sensible of the impressions they make, is called by logicians *perception*; and the notices themselves, as they exist in the mind, and are there treasured up to be the materials of thinking and knowledge, are distinguished by the name of *ideas*. Having shewn at large, in the article *METAPHYSICS*, how the mind being furnished with ideas, contrives to diversify and enlarge its stock; we have here chiefly to consider the means of making known our thoughts to others; that we may not only understand how knowledge is acquired, but also in what manner it may be communicated with the greatest certainty and advantage.

## CHAP. I. Of Words, considered as the Signs of our Ideas.

OUR ideas, though manifold and various, are nevertheless all within our own breasts, invisible to others, nor can of themselves be made appear. But God, designing us for society, and to have fellowship with those of our kind, has provided us with organs fitted to frame articulate sounds, and given us also a capacity of using those sounds as signs of internal conceptions. Hence spring words and language; for, having once pitched upon any sound to stand as the mark of an idea in the mind, custom by degrees establishes such a connection between them, that the appearance of the idea in the understanding always brings to our remembrance the sound or name by which it is expressed; as in like manner the hearing of the sound never fails to excite the idea for which it is made

to stand. And thus it is easy to conceive how a man may record his own thoughts, and bring them again into view in any succeeding period of life. For this connection being once settled, as the same sounds will always serve to excite the same ideas; if he can but contrive to register his words in the order and disposition in which the present train of his thoughts present them to his imagination, it is evident he will be able to recal these thoughts at pleasure, and that too in the very manner of their first appearance. Accordingly we find, that the inventions of writing and printing, by enabling us to fix and perpetuate such perishable things as sounds, have also furnished us with the means of giving a kind of permanency to the transactions of the mind, inasmuch that they may be in the same manner subjected to our review, as any other abiding objects of nature.

II. But, besides the ability of recording our own thoughts, there is this farther advantage in the use of external signs, that they enable us to communicate our sentiments to each other, and also receive information of what passes in their breasts. For any number of men, having agreed to establish the same sounds as signs of the same ideas, it is apparent that the repetition of these sounds must excite the like perceptions in each, and create a perfect correspondence of thoughts. When, for instance, any train of ideas succeeded one another in my mind, if the names by which I am wont to express them have been annexed by those with whom I converse to the very same set of ideas, nothing is more evident, than that, by repeating those names according to the tenor of my present conceptions, I shall raise in their minds the same course of thought as has taken possession of my own. Hence, by barely attending to what passes within themselves, they will also become acquainted with the ideas in my understanding, and have them in a manner laid before their view. So that we here clearly perceive how a man may communicate his sentiments, knowledge and discoveries to others, if the language in which he converses be extensive enough to mark all the ideas and transactions of his mind. But as this is not always the case, and men are often obliged to in-

And of the mutual communication of knowledge from one man to another.

vent terms of their own, to express new views and conceptions of things; it may be asked, how in these circumstances we can become acquainted with the thoughts of another, when we make use of words, to which we have never annexed any ideas, and that of course can raise no perceptions in our minds. In order to unveil this mystery, and give some little insight into the foundation, growth, and improvement of language, the following observations will be found of considerable moment.

3  
Simple ideas cannot be conveyed into the mind by words, or a description.

III. First, That no word can be to any man the sign of an idea, till that idea comes to have a real existence in his mind. For names, being only so far intelligible as they denote known internal conceptions, where they have none such to answer them, there they are plainly sounds without signification, and of course convey no instruction or knowledge. But no sooner are the ideas to which they belong raised in the understanding, than, finding it easy to connect them with the established names, we can join in any agreement of this kind made by others, and thereby enjoy the benefit of their discoveries. The first thing therefore to be considered is, how these ideas may be conveyed into the mind; that being there, we may learn to connect them with their appropriated sounds, and so become capable of understanding others when they make use of these sounds in laying open and communicating their thoughts. Now, to comprehend this distinctly, it will be necessary to attend to the division of our ideas into simple and complex, (see METAPHYSICS). And first, as for our simple ideas, they can find no admission into the mind, but by the two original fountains of knowledge, sensation and reflection: If therefore any of these have as yet no being in the understanding, it is impossible by words or a description to excite them there. A man who had never felt the impression of *heat*, could not be brought to comprehend that sensation by any thing we might say to explain it. If we would really produce the idea in him, it must be by applying the proper object to his senses, and bringing him within the influence of a hot body. When this is done, and experience has taught him the perception to which men have annexed the name *heat*, it then becomes to him the sign of that idea, and he thenceforth understands the meaning of the term, which, before, all the words in this world would not have been sufficient to convey into his mind. The case is the same in respect of light and colours. A man born blind, and thereby deprived of the only conveyance for the ideas of this class, can never be brought to understand the names by which they are expressed. The reason is plain: they stand for ideas that have no existence in his mind; and as the organs appropriated to their reception is wanting, all other contrivances are vain, nor can they by any force of description be raised in his imagination. But it is quite otherwise in our complex notions. For these being no more than certain combinations of simple ideas, put together in various forms; if the original ideas out of which the collections are made have already got admission into the understanding, and the names serving to express them are known; it will be easy, by enumerating the several ideas concerned in the composition, and marking the order and manner in which

they are united, to raise any complex conception in the mind. Thus the idea answering to the word *rainbow* may be readily excited in the imagination of another who has never seen the appearance itself, by barely describing the figure, largeness, position, and order of colours; if we suppose these several simple ideas, with their names, sufficiently known to him.

IV. And this leads to a second observation upon this subject, namely, That words standing for complex ideas are all definable, but those by which we denote simple ideas are not; for the perceptions of this latter class, having no other entrance into the mind than by sensation or reflection, can only be got by experience, from the several objects of nature, proper to produce those perceptions in us. Words indeed may very well serve to remind us of them, if they have already found admission into the understanding, and their connection with the established names is known; but they can never give them their original being and existence there. And hence it is, that when any one asks the meaning of a word denoting a simple idea, we pretend not to explain it to him by a definition, well knowing that to be impossible; but, supposing him already acquainted with the idea, and only ignorant of the name by which it is called, we either mention it to him by some other name, with which we presume he knows its connection, or appeal to the object where the idea itself is found. Thus was any one to ask the meaning of the word *white*, we should tell him it stood for the same idea as *albus* in Latin, or *blanc* in French; or, if we thought him a stranger to these languages, might appeal to an object producing the idea, by saying it denoted the colour we observe in *jasu* or *milk*. But this is by no means a definition of the word, exciting a new idea in his understanding; but merely a contrivance to remind him of a known idea, and teach him its connection with the established name. For if the ideas after which he enquires have never yet been raised in his mind; as suppose one who had seen no other colours than *black* and *white*, should ask the meaning of the word *scarlet*; it is easy to perceive, that it would be no more possible to make him comprehend it by words, or a definition, than to discourse the same perception into the imagination of a man born blind. The only method in this case is, to present some object, by looking at which the perception itself may be excited, and thus he will learn both the name and the idea together.

V. But how comes it to pass that men agree in the names of their simple ideas, seeing they cannot view the perceptions in one another's minds, nor make known these perceptions by words to others? The effect is produced by experience and observation. Thus finding, for instance, that the name of *heat* is annexed to that impression which men feel when they approach the fire, I make it also the sign of the idea excited in me by such an approach, nor have any doubt but it denotes the same perception in my mind as in theirs. For we are naturally led to imagine, that the same objects operate alike upon the organs of the human body, and produce an uniformity of sensations. No man fancies, that the idea raised in him by the taste of *sugar*, and which he calls *sweetness*, differs from that excited in another by the like means; or that

4  
The names of complex ideas definable, those of simple ideas not.

5  
Experience and observation bring men to an agreement in the names of simple ideas.

that *wormwood*, to whose relish he has given the epithet *bitter*, produces in another the sensation which he denotes by the word *facet*. Presuming therefore upon this conformity of perceptions, when they arise from the same objects, we easily agree as to the names of our simple ideas; and if at any time, by a more narrow scrutiny into things, new ideas of this class come in our way, which we chuse to express by terms of our own invention; these names are explained, not by a definition, but by referring to the objects whence the ideas themselves may be obtained.

6  
The conveyance of complex ideas by definitions, a wise contrivance in nature.

VI. Being in this manner furnished with simple ideas, and the names by which they are expressed, the meaning of terms that stand for complex ideas is easily got; because the ideas themselves answering to these terms may be conveyed into the mind by definitions. For our complex notions are only certain combinations of simple ideas. When therefore these are enumerated, and the manner in which they are united into one conception, explained, nothing more is wanting to raise that conception in the understanding; and thus the term denoting it comes of course to be understood. And here it is worth while to reflect a little upon the wise contrivance of nature, in thus furnishing us with the very aptest means of communicating our thoughts. For were it not so ordered, that we could thus convey our complex ideas from one to another by definitions, it would in many cases be impossible to make them known at all. This is apparent in those ideas which are the proper work of the mind. For as they exist only in the understanding, and have no real objects in nature in conformity to which they are framed; if we could not make them known by description, they must lie for ever hid within our own breasts, and be confined to the narrow acquaintance of a single mind. All the fine scenes that arise from time to time in the poet's fancy, and by his lively painting give such entertainment to his readers; were he destitute of this faculty of laying them open to the view of others by words and description, could not extend their influence beyond their own imagination, or give joy to any but the original inventor.

7  
And of great avail towards the improvement of knowledge.

VII. There is this farther advantage, in the ability we enjoy of communicating our complex notions by definitions; as that these make by far the largest class of our ideas, and most frequently occur in the progress and improvement of knowledge, so they are by these means imparted with the greatest readiness, than which nothing could tend more to the increase and spreading of science: for a definition is soon perused; and if the terms of it are well understood, the idea itself finds an easy admission into the mind. Whereas in simple perceptions, where we are referred to the objects producing them, if these cannot be come at, as is sometimes the case, the names by which they are expressed must remain empty sounds. But new ideas of this class occurring very rarely in the sciences, they seldom create any great obstruction. It is otherwise with our complex notions; for every step we take leading us into new combinations and views of things, it becomes necessary to explain these to others, before they can be made acquainted with our discoveries. and as the manner of definitions is easy, requiring no

apparatus but of words, which are always ready, and at hand; hence we can with the less difficulty remove such obstacles as might arise from terms of our own invention, when they are made to stand for new, complex ideas suggested to the mind by some present train of thinking. And thus at last we are let into the mystery hinted at in the beginning of this chapter, viz. how we may become acquainted with the thoughts of another, when he makes use of words to which we have as yet joined no ideas. The answer is obvious from what has been already said. If the terms denote simple perceptions, he must refer us to these objects of nature whence the perceptions themselves are to be obtained; but, if they stand for complex ideas, their meaning may be explained by a definition.

## CHAP. II. Of Definitions.

I. A definition is the unfolding of some conception of the mind, answering to the word or term made use of as the sign of it. 8  
Definition defined.

Now as, in exhibiting any idea to another, it is necessary that the description be such as may excite that precise idea in his mind; hence it is plain that definitions, properly speaking, are not arbitrary, but confined to the representing of certain determinate settled notions, such namely as are annexed by the speaker or writer to the words he uses. As nevertheless it is universally allowed that the signification of words is perfectly voluntary, and not the effect of any natural and necessary connection between them and the ideas for which they stand; some may perhaps wonder why definitions are not so too. In order therefore to unravel this difficulty, and shew distinctly what is and what is not arbitrary in speech, we must carefully distinguish between the connection of our words and ideas, and the unfolding of the ideas themselves.

II. First, as to the connection of our words and ideas; this, it is plain, is a purely arbitrary institution. When, for instance, we have in our minds the idea of any particular species of metals, the calling it by the name *gold* is an effect of the voluntary choice of men speaking the same language, and not of any peculiar aptness in that sound to express that idea. Other nations we find make use of different sounds, and with the same effect. Thus *aurum* denotes that idea in Latin, and *or* in French, and even the word *gold* itself would have as well served to express the idea of that metal which we call *silver*, had custom in the beginning established it. 9  
The connection between words and ideas, a perfectly voluntary establishment.

III. But although we are thus entirely at liberty in connecting any idea with any sound, yet it is quite otherwise in unfolding the ideas themselves. For every idea having a precise appearance of its own, by which it is distinguished from every other idea; it is manifest, that in laying it open to others, we must study such a description as shall exhibit that peculiar appearance. When we have formed to ourselves the idea of a figure bounded by four equal sides, joined together at right angles, we are at liberty to express that idea by any sound, and call it either a *square* or a *triangle*. But which ever of these names we use, so long as the idea is the same, the description by which we would signify it to another must be so too. Let it be called *square* or *triangle*, it is still a figure having 10  
The description of ideas not so, but bounded to the representation of that precise appearance by which they are distinguished among themselves.

11  
Causes of  
the obscuri-  
ty that has  
hitherto  
perplexed  
the theory  
of defini-  
tions.

four equal sides, and all its angles right ones. Hence we clearly see what is and what is not arbitrary in the use of words. The establishing any found as the mark of some determinate idea in the mind, is the effect of free choice, and a voluntary combination among men. And as different nations make use of different founds to denote the same ideas, hence proceeds all that variety of languages which we meet with in the world. But when a connection between our ideas and words is once settled, the unfolding of the idea answering to any word, which properly constitutes a definition, is by no means an arbitrary thing. For here we are bound to exhibit that precise conception which either the use of language, or our own particular choice, hath annexed to the term we use.

IV. And thus it appears, that definitions, considered as descriptions of ideas in the mind, are steady and invariable, being bounded to the representation of these precise ideas. But then, in the application of definitions to particular names, we are altogether left to our own free choice. Because as the connecting of any idea with any found is a perfectly arbitrary institution; the applying the description of that idea to that found must be so too. When therefore logicians tell us that the definition of the name is arbitrary, they mean no more than this; that as different ideas may be connected with any term, according to the good pleasure of him that uses it, in like manner may different descriptions be applied to the term suitable to the ideas so connected. But this connection being settled, and the term considered as the sign of some fixed idea in the understanding, we are no longer left to arbitrary explications, but must study such a description as corresponds with that precise idea. Now this alone, according to what has been before laid down, ought to be accounted a definition. What seems to have occasioned no small confusion in this matter, is, that many explanations of words where no idea is unfolded, but merely the connection between some word and idea asserted, have yet been dignified with the name of definitions. Thus, when we say that *a clock is an instrument by which we measure time*; that is by some called a definition; and yet it is plain that we are beforehand supposed to have an idea of this instrument, and only taught that the word *clock* serves in common language to denote that idea. By this rule all explications of words in our dictionaries will be definitions, nay, the names of even simple ideas may be thus defined. *White*, we may say, is the colour we observe in snow or milk; *heat* the sensation produced by approaching the fire; and so in innumerable other instances. But these, and all others of the like kind, are by no means definitions, exciting new ideas in the understanding, but merely contrivances to remind us of known ideas, and teach their connection with the established names.

22  
Complex  
ideas alone  
capable of  
that kind of  
description  
which goes  
by the name  
of a defini-  
tion.

V. But now in definitions properly so called, we first consider the term we use, as the sign of some inward conception, either annexed to it by custom, or our own free choice; and then the business of the definition is to unfold and explicate that idea. As therefore the whole art lies in giving just and true copies of our ideas; a definition is then said to be made perfect, when it serves distinctly to excite the idea de-

scribed in the mind of another, even supposing him before wholly unacquainted with it. This point settled, let us next inquire what those ideas are which are capable of being thus unfolded? And in the first place it is evident, that all our simple ideas are necessarily excluded. We have seen already that experience alone is to be consulted here, inasmuch that if either the objects whence they are derived come not in our way, or the avenues appointed by nature for their reception are wanting, no description is sufficient to convey them into the mind. But where the understanding is already supplied with these original and primitive conceptions, as they may be united together in an infinity of different forms; so may all their several combinations be distinctly laid open, by enumerating the simple ideas concerned in the various collections, and tracing the order and manner in which they are linked one to another. Now these combinations of simple notions constitute what we call our complex notions; whence it is evident that complex ideas, and those alone, admit of that kind of description which goes by the name of a definition.

VI. Definitions, then, are pictures or representations of our ideas; and as these representations are then only possible when the ideas themselves are complex, it is obvious to remark, that definitions cannot have place but where we make use of terms standing for such complex ideas. But our complex ideas, being as we have said nothing more than different combinations of simple ideas; we then know and comprehend them perfectly, when we know the several simple ideas of which they consist, and can so put them together in our minds as is necessary towards the framing of that peculiar connection which gives every idea its distinct and proper appearance.

VII. Two things are therefore required in every definition. First, that all the original ideas, out of which the complex one is formed, be distinctly enumerated. Secondly, that the order and manner of combining them into one conception be clearly explained. Where a definition has these requisites, nothing is wanting to its perfection; because every one who reads it and understands the terms, seeing at once what ideas he is to join together, and also in what manner, can at pleasure form in his own mind the complex conception answering to the term defined. Let us, for instance, suppose the word *square* to stand for that idea by which we represent to ourselves a figure whose sides subtend quadrants of a circumscribed circle. The parts of this idea are the sides bounding the figure. These must be four in number, and all equal among themselves, because they are each to subtend a fourth part of the same circle. But, besides these component parts, we must also take notice of the manner of putting them together, if we would exhibit the precise idea for which the word *square* here stands. For four equal right lines, any-how joined, will not subtend quadrants of a circumscribed circle. A figure with this property must have its sides standing also at right angles. Taking in therefore this last consideration respecting the manner of combining the parts, the idea is fully described, and the definition thereby rendered complete. For a figure bounded by four equal sides, joined together at right angles, has the

13  
Two things  
required in  
a definition,  
to enu-  
merate the  
ideas, and  
explain the  
manner of  
their com-  
binations.

the property required; and is moreover the only right lined figure to which that property belongs.

14  
How we are to proceed to arrive at just and adequate definitions.

VIII. It will now be obvious to every one in what manner we ought to proceed, in order to arrive at just and adequate definitions. First, we are to take an exact view of the idea to be described, trace it to its original principles, and mark the several simple perceptions that enter into the composition of it. Secondly, we are to consider the particular manner in which these elementary ideas are combined, in order to the forming of that precise conception for which the term we make use of stands. When this is done, and the idea wholly unravelled, we have nothing more to do than fairly transcribe the appearance it makes to our own minds. Such a description, by distinctly exhibiting the order and number of our primitive conceptions, cannot fail to excite at the same time in the mind of every one that reads it, the complex idea resulting from them; and therefore attains the true and proper end of a definition.

CHAP. III. *Of the Composition and Resolutions of our Ideas, and the Rules of Definition thence arising.*

15  
In compounding our ideas, we proceed by a success. five gradations.

I. THE rule laid down in the foregoing chapter is general, extending to all possible cases; and is indeed that to which alone we can have recourse, where any doubt or difficulty arises. It is not however necessary that we should practise it in every particular instance. Many of our ideas are extremely complicated, inasmuch that to enumerate all the simple perceptions out of which they are formed, would be a very troublesome and tedious work. For this reason logicians have established certain compendious rules of defining, of which it may not be amiss here to give some account. But in order to the better understanding of what follows, it will be necessary to observe that there is a certain gradation in the composition of our ideas. The mind of man is very limited in its views, and cannot take in a great number of objects at once. We are therefore fain to proceed by steps, and make our first advances subservient to those which follow. Thus in forming our complex notions, we begin at first with but a few simple ideas, such as we can manage with ease, and unite them together into one conception. When we are provided with a sufficient stock of these, and have by habit and use rendered them familiar to our minds, they become the component parts of other ideas still more complicated, and form what we may call a second order of compound notions. This process, as is evident, may be continued to any degree of composition we please, mounting from one stage to another, and enlarging the number of combinations.

16  
Hence ideas of this class best comprehended, when we advance gradually through all the several orders.

II. But now as soon as this kind, whoever would acquaint his mind forming twith the last and highest order of ideas, finds it much the most expedient method to proceed gradually thorough all the intermediate steps. For, was he to take any very compound idea to pieces, and, without regard to the several classes of simple perceptions that have already been formed into distinct combinations, break it at once into its original principles, the number would be so great as perfectly to confound the imagination, and overcome the utmost reach and capacity of the mind. When we see

a prodigious multitude of men jumbled together in crowds, without order or any regular position, we find it impossible to arrive at an exact knowledge of their number. But if they are formed into separate battalions, and so stationed as to fall within the leisure survey of the eye; by viewing them successively and in order, we come to an easy and certain determination. It is the same in our complex ideas. When the original perceptions, out of which they are framed, are very numerous, it is not enough that we take a view of them in loose and scattered bodies; we must form them into distinct classes, and unite these classes in a just and orderly manner, before we can arrive at a true knowledge of the compound notions resulting from them.

III. This gradual progress of the mind to its compound notions, through a variety of intermediate steps, plainly points out the manner of conducting the definitions, by which these notions are conveyed into the minds of others. For as the series begins with simple and easy combinations, and advances through a succession of different orders, rising one above another in the degree of composition; it is evident that, in a train of definitions expressing these ideas, a like gradation is to be observed. Thus the complex ideas of the lowest order can no otherwise be described than by enumerating the simple ideas out of which they are made, and explaining the manner of their union. But then in the second, or any other succeeding order; as they are formed out of those gradual combinations, and constitute the inferior classes, it is not necessary, in describing them, to mention one by one all the simple ideas of which they consist. They may be more distinctly and briefly unfolded, by enumerating the compound ideas of a lower order, from whose union they result, and which are all supposed to be already known in consequence of previous definitions. Here then it is that the logical method of defining takes place; which that it may be the better understood, we shall explain somewhat more particularly the several steps and gradations of the mind in compounding its ideas, and thence deduce that peculiar form of a definition which logicians have thought fit to establish.

IV. All the ideas we receive from the several objects of nature that surround us, represent distinct individuals. These individuals, when compared together, are found in certain particulars to resemble. Hence, by collecting the resembling particulars into one conception, we form the notion of a *species*. And here let it be observed, that this last idea is less complicated than that by which we represent any of the particular objects contained under it. For the idea of the species excludes the peculiarities of the several individuals, and retains only such properties as are common to them all. Again, by comparing several species together, and observing their resemblance, we form the idea of a *genus*; where, in the same manner as before, the composition is lessened, because we leave out what is peculiar to the several species compared, and retain only the particulars wherein they agree. It is easy to conceive the mind proceeding thus from one step to another, and advancing through its several classes of general notions, until at last it

17  
Our definitions should keep pace with our ideas, and observe a like gradation.

18  
The steps by which the mind proceeds from particular to general ideas.

comes to the highest genus of all, denoted by the word *being*, where the bare idea of existence is only concerned.

19  
The conduct of the mind in compounding its ideas, as it advances thro' the different orders of perception.

V. In this procedure we see the mind unravelling a complex idea, and tracing it in the ascending scale, from greater or less degrees of composition, until it terminates in one simple perception. If now we take the series the contrary way, and, beginning with the last or highest genus, carry our view downwards, through all the inferior genera and species, quite to the individuals, we shall thereby arrive at a distinct apprehension of the conduct of the understanding in compounding its ideas. For, in the several classes of our perceptions, the highest in the scale is for the most part made up of but a few simple ideas, such as the mind can take in and survey with ease. This first general notion, when branched out into the different subdivisions contained under it, has in every one of them something peculiar, by which they are distinguished among themselves; inso much that, in descending from the genus to the species, we always superadd some new idea, and thereby increase the degree of composition. Thus the idea denoted by the word *figure* is of a very general nature, and composed of but few simple perceptions, as implying no more than space every-where abounded. But if we descend further, and consider the boundaries of this space, as that they may be either lines or surface, we fall into the several species of figure. For when the space is bounded by one or more surfaces, we give it the name of a *solid figure*; but where the boundaries are lines, it is called a *plain figure*.

20  
The idea of the species found by superadding the specific difference to the genus.

VI. In this view of things it is evident, that the species is formed by superadding a new idea to the genus. Here, for instance, the genus is circumscribed space. If now to this we superadd the idea of a circumscription by lines, we frame the notion of that species of figures which are called *plain*; but if we conceive the circumscription to be by surfaces, we have the species of solid figures. This superadded idea is called the *specific difference*, not only as it serves to divide the species from the genus, but because, being different in all the several subdivisions, we thereby also distinguish the species one from another. And as it is likewise that conception, which, by being joined to the general idea, compleats the notion of the species; hence it is plain, that the genus and specific difference are to be considered as the proper and constituent parts of the species. If we trace the progress of the mind still farther, and observe it advancing through the inferior species, we shall find its manner of proceeding to be always the same. For every lower species is formed by superadding some new idea to the species next above it; inso much that in this descending scale of our perceptions, the understanding passes through different orders of complex notions, which become more and more complicated at every step it takes. Let us resume here, for instance, the species of plain figures. They imply no more than space bounded by lines. But if we take in an additional consideration of the nature of these lines, as whether they are *right* or *curved*, we fall into the subdivisions of plain figure, distinguished by the names of *rectilinear*, *curvilinear*, and *mixtilinear*.

VII. And here we are to observe, that though plain figures, when considered as one of those branches that come under the notion of figure in general, take the name of a species; yet compared with the classes of curvilinear, rectilinear, and mixtilinear, into which they themselves may be divided, they really become a genus, of which the before mentioned subdivisions constitute the several species. These species, in the same manner as in the case of plain and solid figures, consist of the genus and specific difference as their constituent parts. For in the curvilinear kind, the curvity of the lines bounding the figure makes what is called the *specific difference*; to which if we join the genus, which here is a plain figure, or space circumscribed by lines, we have all that is necessary towards compleating the notion of this species. We are only to take notice, that this last subdivision, having two genera above it, *viz.* plain figure, and figure in general; the genus joined with the specific difference, in order to constitute the species of curvilinears, is that which lies nearest to the said species. It is the notion of plain figure, and not of figure in general, that joined with the idea of curvity makes up the complex conception of curve-lined figures. For in this descending scale of our ideas, figure in general, plain figures, curve-lined figures, the two first are considered as genera in respect of the third; and the second in order, or that which stands next to the third, is called the *nearest genus*. But now as it is this second idea, which, joined with the notion of curvity, forms the species of curve-lined figures; it is plain, that the third or last idea in the series is made up of the nearest genus and specific difference. This rule holds invariably, however far the series is continued; because, in a train of ideas thus succeeding one another, all that precede the last are considered as so many genera in respect of that last; and the last itself is always formed by superadding the specific difference to the genus next it.

21  
And in all the inferior species, by superadding the specific difference to the nearest genus.

VIII. Here then we have an universal description, applicable to all our ideas of whatever kind, from the highest genus to the lowest species. For, taking them in order downwards from the said general idea, they every where consist of the *genus proximum*, and *differentia specifica*, as logicians love to express themselves. But when we come to the lowest species of all, comprehending under it only individuals, the superadded idea, by which these individuals are distinguished one from another, no longer takes the name of the specific difference. For here it serves not to denote distinct species, but merely a variety of individuals, each of which, having a particular existence of its own, is therefore named *individuum*, being different from every other of the same kind. We must also observe, that in this last case, logicians choose to give to the superadded idea by the name of the *numerical difference*; inso much that, as the idea of a species is made up of the nearest genus and specific difference, so the idea of an individual consists of the lowest species and numeric difference. Thus the circle is a species of curve-lined figures, and what we call the *lowest species*, as comprehending under it only individuals. Circles in particular are distinguished from one another by the length and position of their diameters. The length therefore and

22

23  
Definitions to follow one another in train, and pass thro' the same successive gradations as our compound ideas.

and position of the diameter of a circle is what logicians call the *numerical difference*; because, these being given, the circle itself may be described, and an individual thereby constituted.

IX. Thus the mind, in compounding its ideas, begins, we see, with the most general notions, which, consisting of but a few simple notions, are easily combined and brought together into one conception. Thence it proceeds to the species comprehended under this general idea, and these are formed by joining together the genus and specific difference. And as it often happens, that these species may be still farther subdivided, and run on in a long series of continued gradations, producing various orders of compound perceptions; so all these several orders are regularly and successively formed by annexing in every step the specific difference to the nearest genus. When by this method of procedure we are come to the lowest order of all, by joining the species and numeric difference we frame the ideas of individuals. And here the series necessarily terminates, because it is impossible any farther to bound or limit our conceptions. This view of the composition of our ideas, representing their constituent parts in every step of the progression, naturally points out the true and genuine form of a definition. For as definitions are no more than descriptions of the ideas for which the terms defined stand; and as ideas are then described, when we enumerate distinctly and in order the parts of which they consist; it is plain that, by making our definitions follow one another according to the natural train of our conceptions, they will be subject to the

same rules, and keep pace with the ideas they describe.

X. As therefore the first order of our compound notions, or the ideas that constitute the highest genera in the different scales of perception, are formed by uniting together a certain number of simple notions; so the terms expressing these genera are defined by *enumerating the simple notions so combined*. And as the species comprehended under any genus, or the complex ideas of the second order, arise from superadding the specific difference to the said general idea; so the definition of the names of the species is absolved, in a detail of the ideas of the specific difference, connected with the term of the genus. For the genus having been before defined, the term by which it is expressed stands for a known idea, and may therefore be introduced into all subsequent definitions, in the same manner as the names of simple perceptions. It will now be sufficiently obvious, that the definitions of all the succeeding orders of compound notions will every where consist of the term of the nearest genus, joined with an enumeration of the ideas that constitute the specific difference; and that the definition of individuals unites the names of the lowest species with the terms by which we express the ideas of the numeric difference.

XI. Here then we have the true and proper form of a definition, in all the various orders of conception. This is that method of defining which is commonly called *logical*, and which we see is perfect in its kind, inasmuch as it presents a full and adequate description of the idea for which the term defined stands.

## P A R T II. OF J U D G M E N T.

### CHAP. I. *Of the Grounds of human Judgment.*

25  
Intuition respects the relations between our ideas when they are immediately perceptible.

THE mind being furnished with ideas, its next step in the way to knowledge is, the comparing these ideas together, in order to judge of their agreement or disagreement. In this joint view of our ideas, if the relation is such as to be immediately discoverable by the bare inspection of the mind, the judgments thence obtained are called *intuitions*; from a word that denotes to *look at*; for in this case, a mere attention to the ideas compared suffices to let us see how far they are connected or disjointed. Thus, that *the Whole is greater than any of its Parts*, is an intuitive judgment, nothing more being required to convince us of its truth, than an attention to the ideas of *whole* and *part*. And this too is the reason why we call the act of the mind forming these judgments, *intuition*; as it is indeed no more than an immediate preception of the agreement or disagreement of any two ideas.

26  
Experience and testimony have the ground of judging as to facts.

II. But here it is to be observed, that our knowledge of this kind respects only our ideas, and the relations between them; and therefore can serve only as a foundation to such reasonings as are employed in investigating these relations. Now it so happens, that many of our judgments are conversant about facts, and the real existence of things, which cannot be tra-

ced by the bare contemplation of our ideas. It does not follow, because I have the idea of a circle in my mind, that therefore a figure answering to that idea has a real existence in nature. I can form to myself the notion of a centaur, or golden mountain, but never imagine on that account, that either of them exist. What then are the grounds of our judgment in relation to facts? *experience* and *testimony*. By experience we are informed of the existence of the several objects which surround us, and operate upon our senses. Testimony is of a wider extent, and reaches not only to objects beyond the present sphere of our observation, but also to facts and transactions, which being now past, and having no longer any existence, could not without this conveyance have fallen under our cognizance.

III. Here we have three foundations of human judgment, from which the whole system of our knowledge may with ease and advantage be derived. First, intuition, which respects our ideas themselves, and their relations, and is the foundation of that species of reasoning which we call *demonstration*. For whatever is deduced from our intuitive perceptions, by a clear and connected series of proofs, is said to be demonstrated, and produces absolute certainty in the mind. Hence the knowledge obtained in this manner is what we properly term *science*; because in eve-

27  
Three foundations of human judgment, viz. 1. Intuition, the ground of scientific knowledge.

ry step of the procedure it carries its own evidence along with it, and leaves no room for doubt or hesitation. And what is highly worthy of notice; as the truths of this class express the relation between our ideas, and the same relations must ever and invariably subsist between the same ideas, our deductions in the way of science constitute what we call *eternal, necessary, and immutable truths*. If it be true that the whole is equal to all its parts, it must be so unchangeably; because the relation of equality being attached to the ideas themselves, must ever intervene where the same ideas are compared. Of this nature are all the truths of natural religion, morality, and mathematics, and, in general, whatever may be gathered from the bare view and consideration of our ideas.

28  
2. Experience, the ground of our knowledge of the powers and qualities of bodies.

IV. The second ground of human judgment is *experience*; from which we infer the existence of those subjects that surround us, and fall under the immediate notice of our senses. When we see the sun, or cast our eyes towards a building, we not only have ideas of these objects within ourselves, but ascribe to them a real existence out of the mind. It is also by the information of the senses, that we judge of the qualities of bodies; as when we say that *snow is white, fire hot, or steel hard*. For as we are wholly unacquainted with the internal structure and constitution of the bodies that produce these sensations in us, nay, and are unable to trace any connection between that structure and the sensations themselves, it is evident, that we build our judgments altogether upon observation, ascribing to bodies such qualities as are answerable to the perceptions they excite in us. But this is not the only advantage derived from experience, for to that too are we indebted for all our knowledge regarding the co-existence of sensible qualities in objects, and the operations of bodies one upon another. Ivory, for instance, is hard and elastic; this we know by experience, and indeed by that alone. For, being altogether strangers to the true nature both of elasticity and hardness, we cannot by the bare contemplation of our ideas determine how far the one necessarily implies the other, or whether there may not be a repugnance between them. But when we observe them to exist both in the same object, we are then assured from experience, that they are not incompatible; and when we also find, that a stone is hard and not elastic, and that air though elastic is not hard, we also conclude upon the same foundation, that the ideas are not necessarily conjoined, but may exist separately in different objects. In like manner with regard to the operations of bodies one upon another, it is evident, that our knowledge this way is all derived from observation. *Aqua regia* dissolves gold, as has been found by frequent trial, nor is there any other way of arriving at the discovery. Naturalists may tell us, if they please, that the parts of *aqua regia* are of a texture apt to insinuate between the corpuscles of gold, and thereby loosen and shake them asunder. If this is a true account of the matter, it will notwithstanding be allowed, that our conjecture in regard to the conformation of these bodies is deduced from the experiment, and not the experiment from the conjecture. It was not from any previous knowledge of the intimate structure of *aqua regia* and

gold, and the aptness of their parts to act or to be acted upon, that we came by the conclusion above-mentioned. The internal constitution of bodies is in a manner wholly unknown to us; and could we even surmount this difficulty, yet as the separation of the parts of gold implies something like an active force in the *menstruum*, and we are unable to conceive how it comes to be possessed of this activity; the effect must be owned to be altogether beyond our comprehension. But when repeated trials had once confirmed it, inasmuch that it was admitted as an established truth in natural knowledge, it was then easy for men to spin out theories of their own invention, and contrive such a structure of parts, both for *gold* and *aqua regia*, as would best serve to explain the phenomenon upon the principles of that system of philosophy they had adopted.

V. From what has been said it is evident, that as intuition is the foundation of what we call *scientific knowledge*, so is experience of *natural*. For this last being wholly taken up with objects of sense, or those bodies that constitute the natural world; and their properties, as far as we can discover them, being to be traced only by a long and painful series of observations; it is apparent, that in order to improve this branch of knowledge, we must betake ourselves to the method of trial and experiment.

VI. But though experience is what we may term the immediate foundation of natural knowledge, yet with respect to particular persons its influence is very narrow and confined. The bodies that surround us are numerous, many of them lie at a great distance, and some quite beyond our reach. Life is too short, and so crowded with cares, that but little time is left for any single man to employ himself in unfolding the mysteries of nature. Hence it is necessary to admit many things upon the testimony of others, which by this means becomes the foundation of a great part of our knowledge of body. No man doubts of the power of *aqua regia* to dissolve gold, though perhaps he never himself made the experiment. In these therefore and such like cases we judge of the facts and operations of nature, upon the mere ground of testimony. However, as we can always have recourse to experience where any doubt or scruple arises, this is justly considered as the true foundation of natural philosophy; being indeed the ultimate support upon which our assent rests, and whereto we appeal when the highest degree of evidence is required.

VII. But there are many facts that will not allow of an appeal to the senses, and in this case testimony is the true and only foundation of our judgments. All human actions of whatever kind, when considered as already past, are of the nature here described; because having now no longer any existence, both the facts themselves, and the circumstances attending them, can be known only from the relations of such as had sufficient opportunities of arriving at the truth. *Testimony* therefore is justly accounted a third ground of human judgment; and as from the other two we have deduced *scientific* and *natural* knowledge, so we may from this derive *historical*; by which we mean, not merely a knowledge of the civil transactions of states and kingdoms, but of all facts whatsoever

29  
3. Testimony, the ground of historical knowledge.

ever, where testimony is the ultimate foundation of our belief.

### CHAP. II. Of Affirmative and Negative Propositions.

I. WHILE the comparing of our ideas is considered merely as an act of the mind, assembling them together, and joining or disjoining them according to the result of its perceptions, we call it *judgment*; but when our judgments are put into words, they then bear the name of *propositions*. A proposition therefore is a sentence expressing some judgment of the mind, whereby two or more ideas are affirmed to agree or disagree. Now as our judgments include at least two ideas, one of which is affirmed or denied of the other, so must a proposition have terms answering to these ideas. The idea of which we affirm or deny, and of course the term expressing that idea, is called the *subject* of the proposition. The idea affirmed or denied, as also the term answering it, is called the *predicate*. Thus in the proposition, *God is omnipotent*: *God* is the subject, it being of him that we affirm omnipotence; and *omnipotent* is the predicate, because we affirm the idea expressed by that word to belong to God.

II. But as in propositions, ideas are either joined or disjoined; it is not enough to have terms expressing those ideas, unless we have also some words to denote their agreement or disagreement. That word in a proposition, which connects two ideas together, is called the *copula*; and if a negative particle be annexed, we thereby understand that the ideas are disjoined. The *substantive verb* is commonly made use of for the copula, as in the above-mentioned proposition, *God is omnipotent*; where *is* represents the copula, and signifies the agreement of the ideas of *God* and *omnipotence*. But if we mean to separate two ideas; then, besides the substantive verb, we must also use some particle of negation, to express this repugnance. The proposition, *man is not perfect*, may serve as an example of this kind, where the notion of *perfection* being removed from the idea of *man*, the negative particle *not* is inserted after the copula, to signify the disagreement between the subject and predicate.

III. Every proposition necessarily consists of these three parts; but then it is not alike needful that they be all severally expressed in words; because the copula is often included in the term of the predicate, as when we say, *he sits*; which imports the same as *he is sitting*. In the Latin language, a single word has often the force of a whole sentence. Thus *ambulat* is the same as *ille est ambulans*; *amo*, as *ego sum amans*, and so in innumerable other instances; by which it appears, that we are not so much to regard the number of words in a sentence, as the ideas they represent, and the manner in which they are put together. For wherever two ideas are joined or disjoined in an expression, though of but a single word, it is evident that we have a subject, predicate, and copula, and of consequence a complete proposition.

IV. When the mind joins two ideas, we call it an *affirmative* judgment; when it separates them, a *negative*; and as any two ideas compared together must necessarily either agree or not agree, it is evident, that all our judgments fall under these two divi-

sions. Hence likewise the propositions expressing these judgments are all either affirmative or negative. An affirmative proposition connects the predicate with the subject, as *a stone is heavy*; a negative proposition separates them, as *God is not the author of evil*. Affirmation therefore is the same as joining two ideas together, and this is done by means of the copula. Negation on the contrary marks a repugnance between the ideas compared, in which case a negative particle must be called in, to shew that the connection included in the copula does not take place.

V. Hence we see the reason of the rule commonly laid down by logicians; that in all negative propositions the negation ought to affect the copula. For as the copula, when placed by itself, between the subject and the predicate, manifestly binds them together; it is evident, that, in order to render a proposition negative, the particles of negation must enter it in such a manner as to destroy this union. In a word, then only are two ideas disjoined in a proposition, when the negative particle may be so referred to the copula, as to break the affirmation included in it, and undo that connection it would otherwise establish. When we say, for instance, *No man is perfect*; take away the negation, and the copula of itself plainly unites the ideas in the proposition. But as this is the very reverse of what is intended, a negative mark is added, to shew that this union does not here take place. The negation therefore, by destroying the effect of the copula, changes the very nature of the proposition, inasmuch that, instead of binding two ideas together, it denotes their separation. On the contrary, in this sentence; *The man who departs not from an upright behaviour, is beloved of God*: the predicate *beloved of God* is evidently affirmed of the subject *an upright man*; so that, notwithstanding the negative particle, the proposition is still affirmative. The reason is plain; the negation here affects not the copula, but making properly a part of the subject, serves with other terms in the sentence, to form one complex idea, of which the predicate *beloved of God*, is directly affirmed.

### CHAP. III. Of Universal and Particular Propositions.

I. THE next considerable division of propositions is into *universal* and *particular*. Our ideas, according to what has been already observed in the first Part, are all singular as they enter the mind, and represent individual objects. But as by abstraction we can render them universal, so as to comprehend a whole class of things, and sometimes several classes at once; hence the terms expressing these ideas must be in like manner universal. If therefore we suppose any general term to become the subject of a proposition, it is evident, that whatever is affirmed of the abstract idea belonging to that term may be affirmed of all the individuals to which that idea extends. Thus when we say, *Men are mortal*; we consider mortality, not as confined to one or any number of particular men, but as what may be affirmed without restriction of the whole species. By this means the proposition becomes as general as the idea which makes the subject of it, and indeed derives its universality intirely from that idea, being more or less so according as this may be

( b ) extended

and parti-  
cular.

extended to more or fewer individuals. But it is further to be observed of these general terms, that they sometimes enter a proposition in their full latitude, as in the example given above; and sometimes appear with a mark of limitation. In this last case we are given to understand, that the predicate agrees not to the whole universal idea, but only to a part of it; as in the proposition, *some men are wise*: For here wisdom is not affirmed of every particular man, but restrained to a few of the human species.

36  
Propositions universal where the subject is so, without a mark of restriction.

II. Now from this different appearance of the general idea, that constitutes the subject of any judgment, arises the division of propositions into *universal* and *particular*. An universal proposition is that where in the subject is some general term taken in its full latitude, inasmuch that the predicate agrees to all the individuals comprehended under it, if it denotes a proper species; and to all the several species, and their individuals, if it marks an idea of a higher order. The words *all*, *every*, *no*, *none*, &c. are the proper signs of this universality; and as they seldom fail to accompany general truths, so they are the most obvious criterion whereby to distinguish them. *All animals have a power of beginning motion*. This is an universal proposition; as we know from the word *all* prefixed to the subject *animal*, which denotes that it must be taken in its full extent. Hence the power of beginning motion may be affirmed of all the several species of animals.

37  
Propositions particular where some universal subject appears with a mark of limitation.

III. A particular proposition has in like manner some general term for its subject, but with a mark of limitation added, to denote, that the predicate agrees only to some of the individuals comprehended under a species, or to one or more of the species belonging to any genus, and not to the whole universal idea. Thus, *Some stones are heavier than iron*; *some men have an uncommon share of prudence*. In the last of these propositions, the subject *some men* implies only a certain number of individuals, comprehended under a single species. In the former, where the subject is a genus that extends to a great variety of distinct classes, *some stones* may not only imply any number of particular stones, but also several whole species of stones; inasmuch as there may be not a few with the property there described. Hence we see that a proposition does not cease to be particular by the predicate's agreeing to a whole species, unless that species, singly and distinctly considered, makes also the subject of which we affirm or deny.

38  
Singlar propositions contained under the word of particulars.

IV. There is still one species of propositions that remains to be described, and which the more deserves our notice, as it is not yet agreed among logicians to which of the two classes mentioned above they ought to be referred; namely, *singular* propositions, or those where the subject is an individual. Of this nature are the following: *Sir Isaac Newton was the inventor of fluxions*; *this book contains many useful truths*. What occasions some difficulty as to the proper rank of these propositions is; that the subject being taken according to the whole of its extension, they sometimes have the same effect in reasoning as universals. But if it be considered that they are in truth the most limited kind of particular propositions, and that no proposition can with any propriety be called universal but where

the subject is some universal idea; we shall not be long in determining to which class they ought to be referred. When we say, *Some books contain useful truths*; the proposition is particular, because the general term appears with a mark of restriction. If therefore we say, *This book contains useful truths*; it is evident that the proposition must be still more particular, as the limitation implied in the word *this* is of a more confined nature than in the former case.

V. We see therefore that all propositions are either *affirmative* or *negative*; nor is it less evident, that in both cases they may be *universal* or *particular*. Hence arises that celebrated fourfold division of them into *universal affirmative* and *universal negative*, *particular affirmative* and *particular negative*, which comprehends indeed all their varieties. The use of this method of distinguishing them will appear more fully afterwards, when we come to treat of reasoning and syllogism.

39  
The fourfold division of propositions.

#### CHAP. IV. Of Absolute and Conditional Propositions.

I. The objects about which we are chiefly conversant in this world, are all of a nature liable to change. What may be affirmed of them at one time cannot often at another; and it makes no small part of our knowledge to distinguish rightly these variations, and trace the reasons upon which they depend. For it is observable, that amidst all the vicissitude of nature, some things remain constant and invariable; nor even are the changes to which we see others liable, effected, but in consequence of uniform and steady laws, which, when known, are sufficient to direct us in our judgments about them. Hence philosophers, in distinguishing the objects of our perception into various classes, have been very careful to note, that some properties belong essentially to the general idea, so as not to be separable from it but by destroying its very nature; while others are only accidental, and may be affirmed or denied of it in different circumstances. Thus solidity, a yellow colour, and great weight are considered as essential qualities of gold; but whether it shall exist as an uniform conjoined mass, is not alike necessary. We see that by a proper menstruum it may be reduced to a fine powder, and that an intense heat will bring it into a state of fusion.

40  
Distinction of qualities into essential and accidental.

II. From this diversity in the several qualities of things arises a considerable difference as to the manner of our judging about them. For all such properties as are inseparable from objects, when considered as belonging to any genus or species, are affirmed absolutely, and without reserve of that general idea. Thus we say; *Gold is very heavy*, *a stone is hard*, *animals have a power of self-motion*. But in the case of mutable or accidental qualities, as they depend upon some other consideration distinct from the general idea; that also must be taken into the account, in order to form an accurate judgment. Should we affirm, for instance, of some stones, that they are very susceptible of a rolling motion; the proposition, while it remains in this general form, cannot with any advantage be introduced into our reasonings. An aptness to receive that mode of motion flows from the figure of the stone; which, as it may vary infinitely, our judgment then only becomes applicable and determinate,

41  
Hence a considerable diversity in our manner of judging.

nate, when the particular figure, of which volubility is a consequence, is also taken into the account. Let us then bring in this other consideration, and the proposition will run as follows: *Stones of a spherical form are easily put into a rolling motion.* Here we see the condition upon which the predicate is affirmed, and therefore know in what particular cases the proposition may be applied.

42  
Which gives rise to the division of propositions into absolute and conditional.

III. This consideration of propositions respecting the manner in which the predicate is affirmed of the subject gives rise to the division of them into *absolute* and *conditional*. *Absolute* propositions are those wherein we affirm some property inseparable from the idea of the subject, and which therefore belongs to it in all possible cases; as *God is infinitely wise. Virtue tends to the ultimate happiness of man.* But where the predicate is not necessarily connected with the idea of the subject, unless upon some consideration distinct from that idea, there the proposition is called *conditional*. The reason of the name is taken from the supposition annexed, which is of the nature of a condition, and may be expressed as such. Thus, *If a stone is exposed to the rays of the sun, it will contract some degree of heat. If a river runs in a very declining channel, its rapidity will constantly increase.*

43  
The great importance of this division, as it renders propositions determinate,

IV. There is not any thing of greater importance in philosophy than a due attention to this division of propositions. If we are careful never to affirm things absolutely but where the ideas are inseparably conjoined; and if in our other judgments we distinctly mark the conditions which determine the predicate to belong to the subject; we shall be the less liable to mistake in applying general truths to the particular concerns of human life. It is owing to the exact observance of this rule that mathematicians have been so happy in their discoveries, and that what they demonstrate of magnitude in general may be applied with ease in all obvious occurrences.

44  
And reduces them from particulars to generals.

V. The truth of it is, particular propositions are then known to be true, when we can trace their connection with universals; and it is accordingly the great business of science to find out general truths that may be applied with safety in all obvious instances. Now the great advantage arising from determining with care the conditions upon which one idea may be affirmed or denied of another is this: that thereby particular propositions really become universal, may be introduced with certainty into our reasonings, and serve as standards to conduct and regulate our judgments. To illustrate this by a familiar instance: if we say, *Some water acts very forcibly*; the proposition is particular: and as the conditions on which this forcible action depends are not mentioned, it is as yet uncertain in what cases it may be applied. Let us then supply these conditions, and the proposition will run thus: *Water conveyed in sufficient quantity along a steep descent acts very forcibly.* Here we have an universal judgment, inasmuch as the predicate *forcible action* may be ascribed to all water under the circumstances mentioned. Nor is it less evident that the proposition in this new form is of easy application; and in fact we find that men do apply it in instances where the forcible action of water is required; as in corn-mills and many other works of art.

#### CHAP. V. Of Simple and Compound Propositions.

I. HITHERTO we have treated of propositions, where only two ideas are compared together. These are in the general called *simple*; because, having but one subject and one predicate, they are the effect of a simple judgment that admits of no subdivision. But if it so happens that several ideas offer themselves to our thoughts at once, whereby we are led to affirm the same thing of different objects, or different things of the same object; the propositions expressing these judgments are called *compound*: because they may be resolved into as many others as there are subjects or predicates in the whole complex determination of the mind. Thus, *God is infinitely wise and infinitely powerful.* Here there are two predicates, *infinite wisdom and infinite power*, both affirmed of the same subject; and accordingly the proposition may be resolved into two others, affirming these predicates severally. In like manner in the proposition, *Neither kings nor people are exempt from death*; the predicate is denied of both subjects, and may therefore be separated from them in distinct propositions. Nor is it less evident that if a complex judgment consists of several subjects, and predicates, it may be resolved into as many simple propositions as are the number of different ideas compared together. *Riches and honours are apt to elate the mind, and increase the number of our desires.* In this judgment there are two subjects and two predicates, and it is at the same time apparent that it may be resolved into four distinct propositions. *Riches are apt to elate the mind. Riches are apt to increase the number of our desires. And so of honours.*

II. Logicians have divided these compound propositions into a great many different classes; but, in our opinion, not with a due regard to their proper definition. Thus *conditionals, causals, relatives, &c.* are mentioned as so many distinct species of this kind, though in fact they are no more than simple propositions. To give an instance of a conditional; *If a stone is exposed to the rays of the sun, it will contract some degree of heat.* Here we have but one subject and one predicate; for the complex expression, *A stone exposed to the rays of the sun*, constitutes the proper subject of this proposition, and is no more than one determinate idea. The same thing happens in causals. *Rehoboam was unhappy because he followed evil counsel.* There is here an appearance of two propositions arising from the complexity of the expression; but when we come to consider the matter more nearly, it is evident that we have but a single subject and predicate. *The pursuit of evil counsel brought misery upon Rehoboam.* It is not enough therefore to render a proposition compound, that the subject and predicate are complex notions, requiring sometimes a whole sentence to express them: for in this case the comparison is still confined to two ideas, and constitutes what we call a simple judgment. But where there are several subjects or predicates, or both, as the affirmation or negation may be alike extended to them all, the proposition expressing such a judgment is truly a collection of as many simple ones as there are different ideas compared. Confining ourselves therefore to this more strict and just notion

46  
The proper notion of a compound proposition ascertained.

of compound propositions, they are all reducible to two kinds, *viz. copulatives and disjunctives.*

47  
Compound  
proposi-  
tions, either  
copulative:

III. A *copulative* proposition is, where the subjects and predicates are so linked together, that they may be all severally affirmed or denied one of another. Of this nature are the examples of compound propositions given above. *Riches and honours are apt to elate the mind, and increase the number of our desires. Neither kings nor people are exempt from death.* In the first of these the two predicates may be affirmed severally of each subject, whence we have four distinct propositions. The other furnishes an example of the negative kind, where the same predicate, being disjoined from both subjects, may be also denied of them in separate propositions.

48  
Or disjunc-  
tive.

IV. The other species of compound propositions are those called *disjunctives*; in which, comparing several predicates with the same subject; we affirm that one of them necessarily belongs to it, but leave the particular predicate undetermined. If any one for example says, *This world either exists of itself, or is the work of some all-wise and powerful cause*, it is evident that one of the two predicates must belong to the world; but as the proposition determines not which, it is therefore of the kind we call *disjunctive*. Such too are the following: *The sun either moves round the earth, or is the centre about which the earth revolves. Friendship finds men equal, or makes them so.* It is the nature of all propositions of this class, supposing them to be exact in point of form, that upon determining the particular predicate, the rest are of course to be removed; or if all the predicates but one are removed, that one necessarily takes place. Thus in the example given above; if we allow the world to be the work of some wise and powerful cause, we of course deny it to be self-existent; or if we deny it to be self-existent, we must necessarily admit that it was produced by some wise and powerful cause. Now this particular manner of linking the predicates together, so that the establishing one displaces all the rest; or the excluding all but one necessarily establishes that one; cannot otherwise be effected than by means of *disjunctive* particles. And hence it is that propositions of this class take their names from these particles which make so necessary a part of them, and indeed constitute their very nature considered as a distinct species.

#### CHAP. VI. Of the Division of Propositions into Self-evident and Demonstrable.

49  
Proposi-  
tions divided  
into self-  
evident and  
demonstra-  
ble.

I. WHEN any proposition is offered to the view of the mind, if the terms in which it is expressed and understood; upon comparing the ideas together, the agreement or disagreement asserted is either immediately perceived, or found to lie beyond the present reach of the understanding. In the first case the proposition is said to be *self-evident*, and admits not of any proof, because a bare attention to the ideas themselves produces full conviction and certainty; nor is it possible to call in any thing more evident by way of confirmation. But where the connection or repugnance comes not so readily under the inspection of the mind, there we must have recourse to reasoning; and if by a clear series of proofs we can make out the

truth proposed, inasmuch that self-evidence shall accompany every step of the procedure, we are then able to demonstrate what we assert, and the proposition itself is said to be *demonstrable*. When we affirm, for instance, that it is impossible for the same thing to be and not to be; whoever understands the terms made use of perceives at first glance the truth of what is asserted, nor can he by any efforts bring himself to believe the contrary. The proposition therefore is *self-evident*, and such that it is impossible by reasoning to make it plainer; because there is no truth more obvious or better known, from which as a consequence it may be deduced. But if we say, *This world had a beginning*; the assertion is indeed equally true, but shines not forth with the same degree of evidence. We find great difficulty in conceiving how the world could be made out of nothing; and are not brought to a free and full consent, until by reasoning we arrive at a clear view of the absurdity involved in the contrary supposition. Hence this proposition is of the kind we call *demonstrable*, inasmuch as its truth is not immediately perceived by the mind, but yet may be made appear by means of others more known and obvious, whence it follows as an unavoidable consequence.

II. From what has been said it appears, that reasoning is employed only about demonstrable propositions, and that our intuitive and self-evident perceptions, are the ultimate foundation on which it rests.

III. Self-evident propositions furnish the first principles of reasoning; and it is certain, that if in our researches we employ only such principles as have this character of self-evidence, and apply them according to the rules to be afterwards explained, we shall be in no danger of error in advancing from one discovery to another. For this I may appeal to the writings of the mathematicians, which, being conducted by the express model here mentioned, are an incontestible proof of the firmness and stability of human knowledge, when built upon so sure a foundation. For not only have the propositions of this science stood the test of ages; but are found attended with that invincible evidence, as forces the assent of all who duly consider the proofs upon which they are established.

IV. First then it is to be observed, that they have been very careful in ascertaining their ideas, and fixing the signification of their terms. For this purpose they begin with *definitions*, in which the meaning of their words is so distinctly explained, that they cannot fail to excite in the mind of an attentive reader the very same ideas as are annexed to them by the writer. And indeed the clearness and irresistible evidence of mathematical knowledge is owing to nothing so much as this care in laying the foundation. Where the relation between any two ideas is accurately and justly traced, it will not be difficult for another to comprehend that relation, if in setting himself to discover it he brings the very same ideas into comparison. But if, on the contrary, he affixes to his words ideas different from those that were in the mind of him who first advanced the demonstration; it is evident, that as the same ideas are not compared, the same relation cannot subsist, inasmuch that a proposition will be

50  
Self-evident truths the first principles of reasoning.

51  
Definitions a great help to clearness and evidence in knowledge.

rejected

Hence mathematical principles distinguished into axioms and postulates.

rejected as false, which, had the terms been rightly understood, must have appeared unexceptionably true. A square, for instance, is a figure bounded by four equal right lines, joined together at right angles. Here the nature of the angles makes no less a part of the idea, than the equality of the sides; and many properties demonstrated of the square flow entirely from its being a rectangular figure. If therefore we suppose a man, who has formed a partial notion of a square, comprehending only the equality of its sides, without regard to the angles, reading some demonstration that implies also this latter consideration; it is plain he would reject it as not universally true, inasmuch as it could not be applied where the sides were joined together at unequal angles. For this last figure, answering still to his idea of a square, would be yet found without the property assigned to it in the proposition. But if it comes afterwards to correct his notion, and render his idea complete, he will then readily own the truth and justness of the demonstration.

52 Mathematicians, by beginning with them, procure a ready reception to the truths they advance.

V. We see therefore, that nothing contributes so much to the improvement and certainty of human knowledge, as the having determinate ideas, and keeping them steady and invariable in all our discourses and reasonings about them. And on this account it is, that mathematicians, as was before observed, always begin by defining their terms, and distinctly unfolding the notions they are intended to express. Hence such as apply themselves to these studies have exactly the same views of things; and, bringing always the very same ideas into comparison, readily discerns the relations between them.

53 The establishing of principles, the second step in mathematical knowledge.

VI. When they have taken this first step, and made known the ideas whose relations they intend to investigate; their next care is, to lay down some self-evident truths, which may serve as a foundation for their future reasonings. And here indeed they proceed with remarkable circumspection, admitting no principles but what flow immediately from their definitions, and necessarily force themselves upon a mind in any degree attentive to its perceptions. Thus a circle is a figure formed by a right line moving round some fixed point in the same plane. The fixed point round which the line is supposed to move, and where one of its extremities terminates, is called the *centre* of the circle. The other extremity, which is conceived to be carried round until it returns to the point whence it first set out, describes a curve running into itself, and termed the *circumference*. All right lines drawn from the centre to the circumference are called *radii*. From these definitions compared, geometers derive this self-evident truth; that the radii of the same circle are all equal to one another.

54 Propositions divided into speculative and practical.

VII. We now observe, that in all propositions we either affirm or deny some property of the idea that constitutes the subject of our judgment, or we maintain that something may be done or effected. The first sort are called *speculative* propositions, as in the example mentioned above, the radii of the same circle are all equal one to another. The others are called *practical*, for a reason too obvious to be mentioned; thus, that a right line may be drawn from one point to another, is a practical proposition; inasmuch as it expresses that something may be done.

VIII. From this twofold consideration of propositions arises the twofold division of mathematical principles into axioms and postulates. By an axiom they understand any self-evident speculative truth; as, that the whole is greater than its parts: That things equal to one and the same thing are equal to one another. But a self-evident practical proposition is what they call a postulate. Such are those of Euclid; that a finite right line may be continued directly forwards; that a circle may be described about any centre with any distance. And here we are to observe, that as in an axiom the agreement or disagreement between the subject and predicate must come under the immediate inspection of the mind; so in a postulate, not only the possibility of the thing asserted must be evident at first view, but also the manner in which it may be effected. For where this manner is not of itself apparent, the proposition comes under the notion of the demonstrable kind, and is treated as such by geometrical writers. Thus, to draw a right line from one point to another, is assumed by Euclid as a postulate, because the manner of doing it is so obvious, as to require no previous teaching. But then it is not equally evident, how we are to construct an equilateral triangle. For this reason he advances it as a demonstrable proposition, lays down rules for the exact performance, and at the same time proves, that if these rules are followed, the figure will be justly described.

IX. This leads us to take notice, that as self-evident truths are distinguished into different kinds, according as they are speculative or practical; so is it also with demonstrable propositions. A demonstrable speculative proposition is by mathematicians called a *theorem*. Such is the famous 47<sup>th</sup> proposition of the first book of the elements, known by the name of the *Pythagoric theorem*, from its supposed inventor Pythagoras, viz. "that in every right-angled triangle, the square described upon the side subtending the right-angle is equal to both the squares described upon the sides containing the right-angle." On the other hand, a demonstrable practical proposition is called a *problem*; as where Euclid teaches us to describe a square upon a given right-line.

X. It may not be amiss to add, that, besides the four kinds of propositions already mentioned, mathematicians have also a fifth, known by the name of *corollaries*. These are usually subjoined to theorems or problems, and differ from them only in this; that they flow from what is there demonstrated in so obvious a manner as to discover their dependence upon the proposition whence they are deduced, almost as soon as proposed. Thus Euclid having demonstrated, "that in every right-lined triangle all the three angles taken together are equal to two right-angles;" adds by way of corollary, "that all the three angles of any one triangle taken together are equal to all the three angles of any other triangle taken together;" which is evident at first sight; because in all cases they are equal to two right ones, and things equal to one and the same thing are equal to one another.

The scholia of mathematicians are indifferently annexed to definitions, propositions, or corollaries; and answer the same purposes as annotations upon a classic author.

55 And demonstrable propositions into theorems and problems.

57 Corollaries are deductions from theorems or problems.

58 Scholia serve the purposes of annotations, or a comment.

author. For in them occasion is taken to explain whatever may appear intricate and obscure in a train of reasoning; to answer objections; to teach the application and uses of propositions; to lay open the original

and history of the several discoveries made in the science; and in a word, to acquaint us with all such particulars as deserve to be known, whether considered as points of curiosity or profit.

## P A R T III.

### OF REASONING.

#### CHAP. I. *Of Reasoning in general, and the parts of which it consists.*

59  
Remote relations discovered by means of intermediate ideas.

IT often happens in comparing ideas together, that their agreement or disagreement cannot be discerned at first view, especially if they are of such a nature as not to admit of an exact application one to another. When, for instance, we compare two figures of a different make, in order to judge of their equality or inequality, it is plain, that by barely considering the figures themselves, we cannot arrive at an exact determination; because, by reason of their disagreeing forms, it is impossible so to put them together, as that their several parts shall mutually coincide. Here then it becomes necessary to look out for some third idea that will admit of such an application as the present case requires; wherein if we succeed, all difficulties vanish, and the relation we are in quest of may be traced with ease. Thus right-lined figures are all reduced to squares, by means of which we can measure their areas, and determine exactly their agreement or disagreement in point of magnitude.

63  
This manner of arriving at truth termed reasoning.

II. But how can any third idea serve to discover a relation between two others? The answer is, by being compared severally with these others; for such a comparison enables us to see how far the ideas with which this third is compared are connected or disjointed between themselves. In the example mentioned above of two right-lined figures, if we compare each of them with some square whose area is known, and find the one exactly equal to it, and the other less by a square inch, we immediately conclude that the area of the first figure is a square inch greater than that of the second. This manner of determining the relation between any two ideas, by the intervention of some third with which they may be compared, is that which we call *reasoning*; and is indeed the chief instrument by which we push on our discoveries, and enlarge our knowledge. The great art lies in finding out such intermediate ideas, as, when compared with the others in the question, will furnish evident and known truths; because, as will afterwards appear, it is only by means of them that we arrive at the knowledge of what is hidden and remote.

61  
The parts that constitute an act of reasoning and a syllogism.

III. Hence it appears, that every act of reasoning necessarily includes three distinct judgments; two wherein the ideas whose relation we want to discover are severally compared with the middle idea, and a third wherein they are themselves connected or disjointed, according to the result of that comparison. Now as in the second part of logic our judgments, when put into words, were called propositions, so here in the third part the expressions of our reasonings are termed *syllogisms*. And hence it follows,

that as every act of reasoning implies three several judgments, so every syllogism must include three distinct propositions. When a reasoning is thus put into words, and appears in form of a syllogism, the intermediate idea made use of, to discover the agreement or disagreement we search for, is called the *middle term*; and the two ideas themselves, with which this third is compared, go by the name of the *extremes*.

IV. But as these things are best illustrated by examples; let us, for instance, set ourselves to inquire whether men are accountable for their actions. As the relation between the ideas of *man* and *accountableness* comes not within the immediate view of the mind, our first care must be to find out some third idea that will enable us the more easily to discover and trace it. A very small measure of reflection is sufficient to inform us, that no creature can be accountable for his actions, unless we suppose him capable of distinguishing the good from the bad; that is, unless we suppose him possessed of reason. Nor is this alone sufficient. For what would it avail him to know good from bad actions, if he had no freedom of choice, nor could avoid the one and pursue the other? hence it becomes necessary to take in both considerations in the present case. It is at the same time equally apparent, that where ever there is this ability of distinguishing good from bad actions, and of pursuing the one and avoiding the other, there also a creature is accountable. We have then got a third idea, with which *accountableness* is inseparably connected, viz. *reason and liberty*; which are here to be considered as making up one complex conception. Let us now take this middle idea, and compare it with the other term in the question, viz. *man*, and we all know by experience that it may be affirmed of him. Having thus by means of the intermediate idea formed two several judgments, viz. *that man is possessed of reason and liberty*; and *that reason and liberty imply accountableness*; a third obviously and necessarily follows, viz. *that man is accountable for his actions*. Here then we have a complete act of reasoning, in which, according to what has been already observed, there are three distinct judgments; two that may be styled previous, inasmuch as they lead to the other, and arise from comparing the middle idea with the two ideas in the question: the third is a consequence of these previous acts, and flows from combining the extreme ideas between themselves. If now we put this reasoning into words, it exhibits what logicians term a syllogism; and, when propounded in due form, runs thus:

“Every creature possessed of reason and liberty is accountable for his actions.

“Man is a creature possessed of reason and liberty;

“Therefore man is accountable for his actions.”

V.

62  
Instance, man and accountable-ness.

63  
Premises,  
conclusion,  
extremes,  
middle  
term.

V. In this syllogism we may observe, that there are three several propositions expressing the three judgments implied in the act of reasoning; and so disposed, as to represent distinctly what passes within the mind in tracing the more distant relations of its ideas. The two first propositions answer the two previous judgments in reasoning, and are called the *premises*, because they are placed before the other. The third is termed the *conclusion*, as being gained in consequence of what was asserted in the premises. We are also to remember, that the terms expressing the two ideas whose relations we inquire after, as here *man* and *accountable-ness*, are in general called the *extremes*; and that the intermediate idea, by means of which the relation is traced, *viz.* a creature possessed of reason and liberty, takes the name of the *middle term*. Hence it follows, that by the *premises* of a syllogism we are always to understand the two propositions where the middle term is severally compared with the *extremes*; for these constitute the previous judgments, whence the truth we are in quest of is by reasoning deduced. The *conclusion* is that other proposition, in which the *extremes* themselves are joined or separated agreeably to what appears upon the above comparison.

64  
Major and  
minor  
term, ma-  
jor and mi-  
nor propo-  
sition.

VI. The conclusion is made up of the extreme terms of the syllogism: and the extreme, which serves as the predicate of the conclusion, goes by the name of the *major term*: the other extreme, which makes the subject in the same proposition, is called the *minor term*. From this distinction of the extremes arises also a distinction between the premises, where these extremes are severally compared with the middle term. That proposition which compares the greater extreme, or the predicate of the conclusion with the middle term, is called the *major proposition*: the other, wherein the same middle term is compared with the subject of the conclusion or lesser extreme, is called the *minor proposition*. All this is obvious from the syllogism already given, where the conclusion is, *man is accountable for his actions*. For here the predicate *accountable for his actions*, being connected with the middle term in the first of the two premises; *every creature possessed of reason and liberty is accountable for his actions*, gives what we call the *major proposition*. In the second of the premises; *man is a creature possessed of reason and liberty*, we find the lesser extreme, or subject of the conclusion, *viz.* *man*, connected with the same middle term, whence it is known to be the *minor proposition*. When a syllogism is proposed in due form, the major proposition is always placed first, the minor next, and the conclusion last.

65  
In a single  
act of rea-  
soning the  
premises  
must be in-  
tuitive  
truths.

VII. These things premised, we may in the general define reasoning to be an act or operation of the mind, deducing some unknown proposition from other previous ones that are evident and known. These previous propositions, in a simple act of reasoning, are only two in number; and it is always required that they be of themselves apparent to the understanding, inasmuch that we assent to and perceive the truth of them as soon as proposed. In the syllogism given above, the premises are supposed to be self-evident truths; otherwise the conclusion could not be inferred by a single act of reasoning. If, for instance, in the major, *every creature possessed of reason and liberty is*

*accountable for his actions*, the connection between the subject and predicate could not be perceived by a bare attention to the ideas themselves; it is evident that this proposition would no less require a proof than the conclusion deduced from it. In this case a new middle term must be sought for, to trace the connection here supposed; and this of course furnishes another syllogism, by which having established the proposition in question, we are then, and not before, at liberty to use it in any succeeding train of reasoning. And should it so happen, that in this second essay there was still some previous proposition whose truth did not appear at first sight, we must then have recourse to a third syllogism, in order to lay open that truth to the mind; because so long as the premises remain uncertain, the conclusion built upon them must be so too. When, by conducting our thoughts in this manner, we at last arrive at some syllogism where the previous propositions are intuitive truths; the mind then rests in full security, as perceiving that the several conclusions it has passed through stand upon the immoveable foundation of self-evidence, and when traced to their source terminate in it.

VIII. We see therefore, that in order to infer a conclusion by a single act of reasoning, the premises must be intuitive propositions. Where they are not, previous syllogisms are required; in which case reasoning becomes a complicated act, taking in a variety of successive steps. This frequently happens in tracing the more remote relation of our ideas; where, many middle terms being called in, the conclusion cannot be made out but in consequence of a series of syllogisms following one another in train. But although in this concatenation of propositions, those that form the premises of the last syllogism are often considerably removed from self-evidence; yet if we trace the reasoning backwards, we shall find them the conclusions of previous syllogisms, whose premises approach nearer and nearer to intuition in proportion as we advance, and are found at last to terminate in it. And if, after having thus unravelled a demonstration, we take it the contrary way; and observe how the mind, setting out with intuitive perceptions, couples them together to form a conclusion; how, by introducing this conclusion into another syllogism, it still advances one step farther; and so proceeds, making every new discovery subservient to its future progress; we shall then perceive clearly, that reasoning, in the highest exercise of that faculty, is no more than an orderly combination of those simple acts which we have already so fully explained.

IX. Thus we see, that reasoning beginning with first principles, rises gradually from one judgment to another, and connects them in such manner, that every stage of the progression brings intuitive certainty along with it. And now at length we may clearly understand the definition given above of this distinguishing faculty of the human mind. Reason, we have said, is the ability of deducing unknown truths from principles or propositions that are already known. This evidently appears by the foregoing account, where we see that no proposition is admitted into a syllogism, to serve as one of the previous judgments on which the conclusion rests, unless it is itself a known and esta-

blished truth, whose connection with self-evident principles has been already traced.

CHAP. II. *Of the several kinds of Reasoning; and first, of that by which we determine the Genera and Species of Things.*

68  
Reasoning  
twofold.

I. ALL the aims of human reason in the general be reduced to these two: 1. To rank things under those universal ideas to which they truly belong; and, 2. To ascribe to them their several attributes and properties in consequence of that distribution.

69  
The first  
kind re-  
gards the  
genera and  
species of  
things.

II. One great aim of human reason is to determine the genera and species of things. We have seen in the first Part of this treatise, how the mind proceeds in framing general ideas. We have also seen in the second Part, how by means of these general ideas we come by universal propositions. Now as in these universal propositions we affirm some property of a genus or species, it is plain that we cannot apply this property to particular objects till we have first determined whether they are comprehended under that general idea of which the property is affirmed. Thus there are certain properties belonging to all *even* numbers, which nevertheless cannot be applied to any particular number, until we have first discovered it to be of the species expressed by that natural name. Hence reasoning begins with referring things to their several divisions and classes in the scale of our ideas; and as these divisions are all distinguished by particular names, we hereby learn to apply the terms expressing general conceptions to such particular objects as come under our immediate observation.

70  
The steps  
by which  
we arrive  
at conclu-  
sions of this  
sort.

III. Now in order to arrive at these conclusions, by which the several objects of perception are brought under general names, two things are manifestly necessary. First, that we take a view of the idea itself denoted by that general name, and carefully attend to the distinguishing marks which serve to characterize it. Secondly, that we compare this idea with the object under consideration, observing diligently where in they agree or differ. If the idea is found to correspond with the particular object, we then without hesitation apply the general name; but if no such correspondence intervenes, the conclusion must necessarily take a contrary turn. Let us, for instance, take the number *eight*, and consider by what steps we are led to pronounce it an *even* number. First then, we call to mind the idea signified by the expression an *even* number, viz. that it is a number divisible into two equal parts. We then compare this idea with the number *eight*, and, finding them manifestly to agree, see at once the necessity of admitting the conclusion. These several judgments therefore transferred into language, and reduced to the form of a syllogism, appear thus:

“Every number that may be divided into two equal parts is an *even* number.

“The number *eight* may be divided into two equal parts;

“Therefore the number *eight* is an *even* number.”

IV. Here it may be observed, that where the general idea, to which particular objects are referred, is very familiar to the mind, and frequently in view; this reference, and the application of the general name, seem to be made without any apparatus of rea-

71  
Those steps  
always fol-  
lowed, tho’  
in familiar  
cases we do  
not always  
attend to them.

soning. When we see a horse in the fields, or a dog in the street, we readily apply the name of the species; habit, and a familiar acquaintance with the general idea, suggesting it instantaneously to the mind. We are not however to imagine on this account that the understanding departs from the usual rules of just thinking. A frequent repetition of acts begets a habit; and habits are attended with a certain promptness of execution, that prevents our observing the several steps and gradations by which any course of action is accomplished. But in other instances, where we judge not by precontracted habits, as when the general idea is very complex, or less familiar to the mind, we always proceed according to the form of reasoning established above. A goldsmith, for instance, who is in doubt as to any piece of metal, whether it be of the species called *gold*, first examines its properties, and then comparing them with the general idea signified by that name, if he finds a perfect correspondence, no longer hesitates under what class of metals to rank it.

V. Nor let it be imagined that our researches here, because in appearance bounded to the imposing of general names upon particular objects, are therefore trivial and of little consequence. Some of the most considerable debates among mankind, and such too as nearly regard their lives, interest, and happiness, turn wholly upon this article. Is it not the chief employment of our several courts of judicature to determine in particular instances, what is law, justice, and equity? Of what importance is it in many cases to decide aright whether an action shall be termed *murder* or *manslaughter*? We see then that no less than the lives and fortunes of men depend often upon these decisions. The reason is plain. Actions, when once referred to a general idea, draw after them all that may be affirmed of that idea; inasmuch that the determining the species of actions is all one with determining what proportion of praise or dispraise, commendation or blame, &c. ought to follow them. For as it is allowed that murder deserves death; by bringing any particular action under the head of murder, we of course decide the punishment due to it.

VI. But the great importance of this branch of reasoning, and the necessity of care and circumspection in referring particular objects to general ideas, is still farther evident from the practice of the mathematicians. Every one who has read Euclid knows, that he frequently requires us to draw lines through certain points, and according to such and such directions. The figures thence resulting are often squares, parallelograms, or rectangles. Yet Euclid never supposes this from their bare appearance, but always demonstrates it upon the strictest principles of geometry. Nor is the method he takes in any thing different from that described above. Thus, for instance, having defined a square to be a figure bounded by four equal sides joined together at right angles; when such a figure arises in any construction previous to the demonstration of a proposition, yet he never calls it by that name until he has shewn that its sides are equal, and all its angles right ones. Now this is apparently the same form of reasoning we have before exhibited in proving *eight* to be an even number.

72  
The great  
importance  
of this  
branch of  
reasoning.

73  
And the ex-  
act obser-  
vance of it  
practised by  
mathematicians.

74  
Fixed and  
invariable  
ideas, with  
a steady ap-  
plication of  
names, ren-  
ders this  
part of  
knowledge  
both easy  
and certain.

VII. Having thus explained the rules by which we are to conduct ourselves in ranking particular objects under general ideas, and shewn their conformity to the practice and manner of the mathematicians; it remains only to observe, that the true way of rendering this part of knowledge both easy and certain, is, by habituating ourselves to clear and determinate ideas, and keeping them steadily annexed to their respective names. For as all our aim is to apply general words aright, if these words stand for invariable ideas that are perfectly known to the mind, and can be readily distinguished upon occasion, there will be little danger of mistake or error in our reasonings. Let us suppose that, by examining any object, and carrying our attention successively from one part to another, we have acquainted ourselves with the several particulars observable in it. If among these we find such as constitute some general idea, framed and settled beforehand by the understanding, and distinguished by a particular name, the resemblance thus known and perceived necessarily determines the species of the object, and thereby gives it a right to the name by which that species is called. Thus four equal sides, joined together at right angles, make up the notion of a *square*. As this is a fixed and invariable idea, without which the general name cannot be applied, we never call any particular figure a *square* until it appears to have these several conditions; and contrarily, wherever a figure is found with these conditions, it necessarily takes the name of a *square*. The same will be found to hold in all our other reasonings of this kind, where nothing can create any difficulty but the want of settled ideas. If, for instance, we have not determined within ourselves the precise notion denoted by the word *manslaughter*, it will be impossible for us to decide whether any particular action ought to bear that name: because, however nicely we examine the action itself, yet, being strangers to the general idea with which it is to be compared, we are utterly unable to judge of their agreement or disagreement. But if we take care to remove this obstacle, and distinctly trace the two ideas under consideration, all difficulties vanish, and the resolution becomes both easy and certain.

VIII. Thus we see of what importance it is towards the improvement and certainty of human knowledge, that we accustom ourselves to clear and determinate ideas, and a steady application of words.

CHAP. III. *Of Reasoning, as it regards the Powers and Properties of Things, and the Relations of our general Ideas.*

75  
The distinc-  
tion of rea-  
soning, as it  
regards the  
sciences and  
as it concerns  
common life.

I. WE come now to the second great end which men have in view in their reasonings; namely, the discovering and ascribing to things their several attributes and properties. And here it will be necessary to distinguish between reasoning, as it regards the sciences, and as it concerns common life. In the sciences, our reason is employed chiefly about universal truths, it being by them alone that the bounds of human knowledge are enlarged. Hence the division of things into various classes, called otherwise *genera* and *species*. For these universal ideas being set up as the representatives of many particular things, whatever

is affirmed of them may be also affirmed of all the individuals to which they belong. *Murder*, for instance, is a general idea, representing a certain species of human actions. Reason tells us that the punishment due to it is *death*. Hence every particular action, coming under the notion of *murder*, has the punishment of *death* allotted to it. Here then we apply the general truth to some obvious instance; and this is what properly constitutes the reasoning of common life. For men, in their ordinary transactions and intercourse one with another, have, for the most part, to do only with particular objects. Our friends and relations, their characters and behaviour, the constitution of the several bodies that surround us, and the uses to which they may be applied, are what chiefly engage our attention. In all these, we reason about particular things; and the whole result of our reasoning is, the applying the general truths of the sciences in the ordinary transactions of human life. When we see a viper, we avoid it. Wherever we have occasion for the forcible action of water to move a body that makes considerable resistance, we take care to convey it in such a manner that it shall fall upon the object with impetuosity. Now all this happens in consequence of our familiar and ready application of these two general truths. *The bite of a viper is mortal. Water, falling upon a body with impetuosity, acts very forcibly towards setting it in motion.* In like manner, if we set ourselves to consider any particular character, in order to determine the share of praise or dispraise that belongs to it, our great concern is to ascertain exactly the proportion of virtue and vice. The reason is obvious. A just determination, in all cases of this kind, depends entirely upon an application of these general maxims of morality. *Virtuous actions deserve praise. Vicious actions deserve blame.*

II. Hence it appears that reasoning, as it regards common life, is no more than the ascribing the general properties of things to those several objects with which we are more immediately concerned, according as they are found to be of that particular division or class to which the properties belong. The steps then by which we proceed are manifestly these. First, we refer the object under consideration to some general idea or class of things. We then recollect the several attributes of that general idea. And, lastly, ascribe all those attributes to the present object. Thus, in considering the character of *Sempronius*, if we find it to be of the kind called *virtuous*, when we at the same time reflect that a virtuous character is deserving of esteem, it naturally and obviously follows that *Sempronius* is so too. These thoughts put into a *syllogism*, in order to exhibit the form of reasoning here required, run thus:

“Every virtuous man is worthy of esteem.

“*Sempronius* is a virtuous man:

“Therefore *Sempronius* is worthy of esteem.”

III. By this *syllogism* it appears, that before we affirm any thing of a particular object, that object must be referred to some general idea. *Sempronius* is pronounced worthy of esteem only in consequence of his being a virtuous man, or coming under that general notion. Hence we see the necessary connection of the various parts of reasoning, and the dependence

(c)

they

76  
The steps  
by which  
we proceed  
in the rea-  
soning of  
common  
life.

77

The con-  
nection and  
dependence  
of the two  
grand branches  
of reason-  
ing one upon  
another.

they have one upon another. The determining the genera and species of things is, as we have said, one exercise of human reason; and here we find that this exercise is the first in order, and previous to the other, which consists in ascribing to them their powers, properties, and relations. But when we have taken this previous step, and brought particular objects under general names; as the properties we ascribe to them are no other than those of the general idea, it is plain that, in order to a successful progress in this part of knowledge, we must thoroughly acquaint ourselves with the several relations and attributes of these our general ideas. When this is done, the other part will be easy, and requires scarce any labour or thought, as being no more than an application of the general form of reasoning represented in the foregoing syllogism. Now as we have already sufficiently shown how we are to proceed in determining the genera and species of things, which, as we have said, is the previous step to this second branch of human knowledge; all that is farther wanting towards a due explanation of it is, to offer some considerations as to the manner of investigating the general relations of our ideas. This is the highest exercise of the powers of the understanding, and that by means whereof we arrive at the discovery of universal truths; inasmuch that our deductions in this way constitute that particular species of reasoning which we have before said regards principally the sciences.

78  
Two things  
required to  
make a  
good reason-  
er.

IV. But that we may conduct our thoughts with some order and method, we shall begin with observing, that the relations of our general ideas are of two kinds: either such as immediately discover themselves, upon comparing the ideas one with another; or such as, being more remote and distant, require art and contrivance to bring them into view. The relations of the first kind furnish us with intuitive and self-evident truths: those of the second are traced by reasoning, and a due application of intermediate ideas. It is of this last kind that we are to speak here, having dispatched what was necessary with regard to the other in the second Part. As, therefore, in tracing the more distant relations of things, we must always have recourse to intervening ideas, and are more or less successful in our researches according to our acquaintance with these ideas, and ability of applying them; it is evident that, to make a good reasoner, two things are principally required. *First*, An extensive knowledge of those intermediate ideas, by means of which things may be compared one with another. *Secondly*, The skill and talent of applying them happily in all particular instances that come under consideration.

79  
First, an  
extensive  
knowledge  
of interme-  
diate ideas.

V. In order to our successful progress in reasoning, we must have an extensive knowledge of those intermediate ideas by means of which things may be compared one with another. For as it is not every idea that will answer the purpose of our inquiries, but such only as are peculiarly related to the objects about which we reason, so as, by a comparison with them, to furnish evident and known truths; nothing is more apparent than that the greater variety of conceptions we can call into view, the more likely we are to find some among them that will help us to the truths here

required. And, indeed, it is found to hold in experience, that in proportion as we enlarge our views of things, and grow acquainted with a multitude of different objects, the reasoning faculty gathers strength: for, by extending our sphere of knowledge, the mind acquires a certain force and penetration, as being accustomed to examine the several appearances of its ideas, and observe what light they cast one upon another.

VI. This is the reason why, in order to excel remarkably in any one branch of learning, it is necessary to have at least a general acquaintance with the whole circle of arts and sciences. The truth of it is, all the various divisions of human knowledge are very nearly related among themselves, and, in innumerable instances, serve to illustrate and set off each other. And although it is not to be denied that, by an oblique application to one branch of study, a man may make considerable progress, and acquire some degree of eminence in it; yet his views will be always narrow and contracted, and he will want that masterly discernment which not only enables us to pursue our discoveries with ease, but also, in laying them open to others, to spread a certain brightness around them. But when our reasoning regards a particular science, it is farther necessary that we more nearly acquaint ourselves with whatever relates to that science. A general knowledge is a good preparation, and enables us to proceed with ease and expedition in whatever branch of learning we apply to. But then, in the minute and intricate questions of any science, we are by no means qualified to reason with advantage until we have perfectly mastered the science to which they belong.

VII. We come now to the second thing required, in order to a successful progress in reasoning; namely, the skill and talent of applying intermediate ideas happily in all particular instances that come under consideration. And here, rules and precepts are of little service. Use and experience are the best instructors. For, whatever logicians may boast of being able to form perfect reasoners by book and rule, we find by experience, that the study of their precepts does not always add any great degree of strength to the understanding. In short, it is the habit alone of reasoning that makes a reasoner. And therefore the true way to acquire this talent is, by being much conversant in those sciences where the art of reasoning is allowed to reign in the greatest perfection. Hence it was that the ancients, who so well understood the manner of forming the mind, always began with *mathematics*, as the foundation of their philosophical studies. Here the understanding is by degrees habituated to truth, contracts insensibly a certain fondness for it, and learns never to yield its assent to any proposition, but where the evidence is sufficient to produce full conviction. For this reason *Plato* has called mathematical demonstrations the *cathartics* or purgatives of the soul, as being the proper means to cleanse it from error, and restore that natural exercise of its faculties in which just thinking consists.

VIII. If therefore we would form our minds to a habit of reasoning closely and in train, we cannot take

80  
To excel in  
any one  
branch of  
learning,  
we must be  
in general  
acquainted  
with the  
whole circle  
of arts and  
sciences.

81  
Secondly,  
the skill of  
applying in-  
termediate  
ideas hap-  
pily in par-  
ticular in-  
stances.

82  
The study of mathematical demonstrations of great avail in this respect.

83  
As also of such authors on other subjects, as are distinguished for strength and justness of reasoning.

take any more certain method, than the exercising ourselves in mathematical demonstrations, so as to contract a kind of familiarity with them. Not that we look upon it as necessary that all men should be deep mathematicians; but that, having got the way of reasoning which that study necessarily brings the mind to, they may be able to transfer it to other parts of knowledge, as they shall have occasion.

IX. But although the study of mathematics be of all others the most useful, to form the mind, and give it an early relish of truth, yet ought not other parts of philosophy to be neglected. For there also we meet with many opportunities of exercising the powers of the understanding; and the variety of subjects naturally leads us to observe all those different turns of thinking that are peculiarly adapted to the several ideas we examine, and the truth we search after. A mind thus trained acquires a certain mastery over its own thoughts, inasmuch that it can range and model them at pleasure, and call such into view as best suit its present designs. Now in this the whole art of reasoning consists; from among a great variety of different ideas to single out those that are most proper for the business in hand, and to lay them together in such order, that from plain and easy beginnings, by gentle degrees, and a continued train of evident truths, we may be insensibly led on to such discoveries, as at our first setting out appeared beyond the reach of human understanding. For this purpose, besides the study of mathematics before recommended, we ought to apply ourselves diligently to the reading of such authors as have distinguished themselves for strength of reasoning, and a just and accurate manner of thinking. For it is observable, that a mind exercised and seasoned to truth, seldom rests satisfied in a bare contemplation of the arguments offered by others; but will be frequently assaying its own strength, and pursuing its discoveries upon the plan it is most accustomed to. Thus we insensibly contract a habit of tracing truth from one stage to another, and of investigating those general relations and properties which we afterwards ascribe to particular things, according as we find them comprehended under the abstract ideas to which the properties belong.

#### CHAP. IV. Of the Forms of Syllogisms.

84  
The figures of syllogisms.

I. HITHERTO we have contented ourselves with a general notion of syllogisms, and of the parts of which they consist. It is now time to enter a little more particularly into the subject, to examine their various forms, and lay open the rules of argumentation proper to each. In the syllogisms mentioned in the foregoing chapters, we may observe, that the *middle term* is the subject of the *major* proposition, and the predicate of the *minor*. This disposition, though the most natural and obvious, is not however necessary; it frequently happening, that the middle term is the subject in both the premises, or the predicate in both; and sometimes, directly contrary to its disposition in the foregoing chapters, the predicate in the major, and the subject in the minor. Hence the distinction of syllogisms into various kinds, called *figures* by logicians. For figure, according to their use of the word, is nothing else but the order and disposition of the

middle term in any syllogism. And as this disposition is, we see, fourfold, so the figures of syllogisms thence arising are four in number. When the middle term is the subject of the major proposition, and the predicate of the minor, we have what is called the *first figure*. If, on the other hand, it is the predicate of both the premises, the syllogism is said to be the *second figure*. Again, in the *third figure*, the middle term is the subject of the two premises. And lastly, by making it the predicate of the major, and subject of the minor, we obtain syllogisms in the *fourth figure*.

II. But, besides this fourfold distinction of syllogisms, there is also a farther subdivision of them in every figure, arising from the *quantity* and *quality*, as they are called, of the propositions. By quantity we mean the consideration of propositions, as universal or particular; by quality, as affirmative or negative.

Now as, in all the several dispositions of the middle term, the propositions of which a syllogism consists may be either universal or particular, affirmative or negative; the due determination of these, and so putting them together as the laws of argumentation require, constitute what logicians call the *moods* of syllogisms. Of these moods there is a determinate number to every figure, including all the possible ways in which propositions differing in quantity or quality can be combined, according to any disposition of the middle term, in order to arrive at a just conclusion.

III. The division of syllogisms according to *Mood* and *figure* respects those especially which are known by the name of plain simple syllogisms; that is, which are bounded to three propositions, all simple, and where the extremes and middle term are connected, according to the rules laid down above. But as the mind is not tied down to any one precise form of reasoning, but sometimes makes use of more, sometimes of fewer premises, and often takes in compound and conditional propositions, it may not be amiss to take notice of the different forms derived from this source, and explain the rules by which the mind conducts itself in the use of them.

IV. When in any syllogism the major is a conditional proposition, the syllogism itself is termed *conditional*. Thus:

"If there is a God, he ought to be worshipped.

"But there is a God :

"Therefore he ought to be worshipped."

In this example, the major, or first proposition, is, we see, conditional, and therefore the syllogism itself is also of the kind called by that name. And here we are to observe, that all conditional propositions are made of two distinct parts: one expressing the condition upon which the predicate agrees or disagrees with the subject, as in this now before us, *if there is a God*; the other joining or disjoining the said predicate and subject, as here, *he ought to be worshipped*. The first of these parts, or that which implies the condition, is called the *antecedent*; the second, where we join or disjoin the predicate and subject, has the name of the *consequent*.

V. In all propositions of this kind, supposing them to be exact in point of form, the relation between the antecedent and consequent must ever be true and real; that is, the antecedent must always contain some cer-

85  
The moods of syllogisms.

86  
Foundation of the other division of syllogism.

87  
Conditional syllogisms.

88  
Ground of illation in conditional syllogisms.

tain and genuine condition, which necessarily implies the consequent; for otherwise the proposition itself will be false, and therefore ought not to be admitted into our reasonings. Hence it follows, that when any conditional proposition is affirmed, if we admit the antecedent of that proposition, we must at the same time necessarily admit the consequent, but if we reject the consequent, we are in like manner bound to reject the antecedent. For as the antecedent always expresses some condition which necessarily implies the truth of the consequent; by admitting the antecedent, we allow of that condition, and therefore ought also to admit the consequent. In like manner, if it appears that the consequent ought to be rejected, the antecedent evidently must be so too; because, as was just now demonstrated, the admitting of the antecedent would necessarily imply the admission also of the consequent.

89  
The two  
moods of  
conditional  
syllogisms.

VI. There are two ways of arguing in *hypothetical* syllogisms, which lead to a certain and unavoidable conclusion. For as the major is always a conditional proposition, consisting of an antecedent and a consequent; if the minor admits the antecedent, it is plain that the conclusion must admit the consequent. This is called arguing from the admission of the antecedent to the admission of the consequent, and constitutes that mood or species of hypothetical syllogisms which is distinguished in the schools by the name of the *modus ponens*, inasmuch as by it the whole conditional proposition, both antecedent and consequent, is established. Thus:

"If God is infinitely wise, and acts with perfect freedom, he does nothing but what is best."

"But God is infinitely wise, and acts with perfect freedom:

"Therefore he does nothing but what is best."

Here we see the antecedent or first part of the conditional proposition is established in the minor, and the consequent or second part in the conclusion; whence the syllogism itself is an example of the *modus ponens*. But if now we on the contrary suppose that the minor rejects the consequent, then it is apparent that the conclusion must also reject the antecedent. In this case we are said to argue from the removal of the consequent to the removal of the antecedent, and the particular mood or species of syllogisms thence arising is called by logicians the *modus tollens*; because in it both antecedent and consequent are rejected or taken away, as appears by the following example.

"If God were not a Being of infinite goodness, neither would he consult the happiness of his creatures."

"But God does consult the happiness of his creatures:

"Therefore he is a Being of infinite goodness."

VII. These two species take in the whole class of conditional syllogisms, and include all the possible ways of arguing that lead to a legitimate conclusion; because we cannot here proceed by a contrary process of reasoning, that is, from the removal of the antecedent to the removal of the consequent, or from the establishing of the consequent to the establishing of the antecedent. For although the antecedent always expresses some real condition, which, once admitted, necessarily implies the consequent, yet it does not follow that there is therefore no other condition; and if

so, then, after removing the antecedent, the consequent may still hold, because of some other determination that inserts it. When we say, *If a stone is exposed some time to the rays of the Sun, it will contract a certain degree of heat*; the proposition is certainly true; and, admitting the antecedent, we must also admit the consequent. But as there are other ways by which a stone may gather heat, it will not follow, from the ceasing of the before-mentioned condition, that therefore the consequent cannot take place. In other words, we cannot argue: *But the stone has not been exposed to the rays of the sun; therefore neither has it any degree of heat*: Inasmuch as there are a great many other ways by which heat might have been communicated to it. And if we cannot argue from the removal of the antecedent to the removal of the consequent, no more can we from the admission of the consequent to the admission of the antecedent: because, as the consequent may flow from a great variety of different suppositions, the allowing of it does not determine the precise supposition, but only that some one of them must take place. Thus in the foregoing proposition, *If a stone is exposed sometime to the rays of the sun, it will contract a certain degree of heat*: admitting the consequent, viz. *that it has contracted a certain degree of heat*, we are not therefore bound to admit the antecedent, *that it has been sometime exposed to the rays of the sun*; because there are many other causes whence that heat may have proceeded. These two ways of arguing, therefore, hold not in conditional syllogisms.

VIII. As from the major's being a conditional proposition, we obtain the species of conditional syllogisms; so where it is a disjunctive proposition, the syllogism to which it belongs, is also called *disjunctive*, as in the following example: 91  
The manner of arguing in disjunctive syllogisms.

"The world is either self-existent, or the work of some finite, or of some infinite Being."

"But it is not self-existent, nor the work of a finite being:

"Therefore it is the work of an infinite Being."

Now a disjunctive proposition is that, where of several predicates, we affirm one necessarily to belong to the subject, to the exclusion of all the rest, but leave that particular one undetermined. Hence it follows, that as soon as we determine the particular predicate, all the rest are of course to be rejected; or if we reject all the predicates but one, that one necessarily takes place. When, therefore, in a disjunctive syllogism, the several predicates are enumerated in the major; if the minor establishes any one of these predicates, the conclusion ought to remove all the rest; or if, in the minor, all the predicates but one are removed, the conclusion must necessarily establish that one. Thus, in the disjunctive syllogism given above, the major affirms one of the three predicates to belong to the earth, viz. *self-existence*, or that it is *the work of a finite*, or that it is *the work of an infinite Being*. Two of these predicates are removed in the minor, viz. *self-existence*, and *the work of a finite being*. Hence the conclusion necessarily ascribes to it the third predicate, and affirms that it is *the work of an infinite Being*. If now we give the syllogism another turn, inasmuch that the minor may establish one of the predicates,

92  
They include all the legitimate ways of arguing.

predicates, by affirming the earth to be the production of an infinite Being; then the conclusion must remove the other two, asserting it to be neither self-existent, nor the work of a finite being. These are the forms of reasoning in these species of syllogisms, the justness of which appears at first sight; and that there can be no other, is evident from the very nature of a disjunctive proposition.

92  
Imperfect  
or mutilated  
syllo-  
gisms.

IX. In the several kinds of syllogisms hitherto mentioned, we may observe, that the parts are complete; that is, the three propositions of which they consist are represented in form. But it often happens, that some one of the premises is not only an evident truth, but also familiar and in the minds of all men; in which case it is usually omitted, whereby we have an imperfect syllogism, that seems to be made up of only two propositions. Should we, for instance, argue in this manner:

“Every man is mortal:

“Therefore every king is mortal.”

The syllogism appears to be imperfect, as consisting but of two propositions. Yet it is really complete; only the minor [*every king is a man*] is omitted, and left to the reader to supply, as being a proposition so familiar and evident that it cannot escape him.

93  
Enthymemes.

X. These seemingly imperfect syllogisms are called *enthymemes*, and occur very frequently in reasoning, especially where it makes a part of common conversation. Nay, there is a particular elegance in them, because, not displaying the argument in all its parts, they leave somewhat to the exercise and invention of the mind. By this means we are put upon exerting ourselves, and seem to share in the discovery of what is proposed to us. Now this is the great secret of fine writing, so to frame and put together our thoughts, as to give full play to the reader's imagination, and draw him insensibly into our very views and course of reasoning. This gives a pleasure not unlike to that which the author himself feels in composing. It besides shortens discourse, and adds a certain force and liveliness to our arguments, when the words in which they are conveyed favour the natural quickness of the mind in its operations, and a single expression is left to exhibit a whole train of thoughts.

94  
Ground of  
reasoning  
in im-  
mediate con-  
sequences.

XI. But there is another species of reasoning with two propositions, which seems to be complete in itself, and where we admit the conclusion without supposing any tacit or suppressed judgment in the mind, from which it follows syllogistically. This happens between propositions, where the connection is such, that the admission of the one necessarily and at the first sight implies the admission also of the other. For if it so falls out, that the proposition on which the other depends is self-evident, we content ourselves with barely affirming it, and infer that other by a direct conclusion. Thus, by admitting an universal proposition, we are forced also to admit of all the particular propositions comprehended under it, this being the very condition that constitutes a proposition universal. If then that universal proposition chances to be self-evident, the particular ones follow of course, without any farther train of reasoning. Whoever allows, for instance, that things equal to one and the same thing are equal to one another, must at the same time allow, that two

triangles, each equal to a square whose side is three inches, are also equal between themselves. This argument therefore,

“Things equal to one and the same thing, are equal to one another:

“Therefore these two triangles, each equal to the square of a line of three inches, are equal between themselves:”

is complete in its kind, and contains all that is necessary towards a just and legitimate conclusion. For the first or universal proposition is self-evident, and therefore requires no farther proof. And as the truth of the particular is inseparably connected with that of the universal, it follows from it by an obvious and unavoidable consequence.

XII. Now in all cases of this kind, where propo- All reducible to syllogisms of some one form or other.

sitions are deduced one from another, on account of a known and evident connection, we are said to reason by immediate consequence. Such a coherence of propositions manifest at first sight, and forcing itself upon the mind, frequently occurs in reasoning. Logicians have explained at some length the several suppositions upon which it takes place, and allow of all immediate consequences that follow in conformity to them. It is however observable, that these arguments, though seemingly complete, because the conclusion follows necessarily from the single proposition that goes before, may yet be considered as real enthymemes, whose major, which is a conditional proposition, is wanting. The syllogism but just mentioned, when represented according to this view, will run as follows:

“If things equal to one and the same thing, are equal to one another; these two triangles, each equal to a square whose side is three inches, are also equal between themselves.

“But things equal to one and the same thing, are equal to one another:

“Therefore also these triangles, &c. are equal between themselves.”

This observation will be found to hold in all immediate consequences whatsoever, inasmuch that they are in fact no more than enthymemes of hypothetical syllogisms. But then it is particular to them, that the ground on which the conclusion rests, namely its coherence with the minor, is of itself apparent, and seen immediately to flow from the rules and reasons of logic.

XIII. The next species of reasoning we shall take notice of here is what is commonly known by the name plain simple of a *sortes*. This is a way of arguing, in which a syllogisms. great number of propositions are so linked together, that the predicate of one becomes continually the subject of the next following, until at last a conclusion is formed, by bringing together the subject of the first proposition, and the predicate of the last. Of this kind is the following argument:

“God is omnipotent.

“An omnipotent being can do every thing possible.

“He that can do every thing possible, can do whatever involves not a contradiction.

“Therefore God can do whatever involves not a contradiction.”

This particular combination of propositions may be continued to any length we please, without in the least weakening

weakening the ground upon which the conclusion rests. The reason is, because the *forites* itself may be resolved into as many simple *sylogisms* as there are middle terms in it; where this is found universally to hold, that when such a resolution is made, and the *sylogisms* are placed in train, the conclusion of the last in the series is also the conclusion of the *forites*. This kind of argument, therefore, as it serves to unite several *sylogisms* into one, must stand upon the same foundation with the *sylogisms* of which it consists, and is indeed, properly speaking, no other than a compendious way of reasoning *sylogistically*.

97  
A *forites* of  
hypotheti-  
cal *sylo-*  
*gisms*.

XIV. What is here said of plain simple propositions may be as well applied to those that are conditional; that is, any number of them may be so joined together in a series, that the consequent of one shall become continually the antecedent of the next following; in which case, by establishing the antecedent of the first proposition, we establish the consequent of the last, or by removing the last consequent remove also the first antecedent. This way of reasoning is exemplified in the following argument.

"If we love any person, all emotions of hatred towards him cease.

"If all emotions of hatred towards a person cease, we cannot rejoice in his misfortunes.

"If we rejoice not in his misfortunes, we certainly wish him no injury :

"Therefore, if we love a person, we wish him no injury."

It is evident that this *forites*, as well as the last, may be resolved into a series of distinct *sylogisms*, with this only difference, that here the *sylogisms* are all conditional.

98  
The ground  
of reason-  
ing by in-  
duction.

XV. We come now to that kind of argument which logicians call *induction*; in order to the right understanding of which, it will be necessary to observe, that our general ideas are for the most part capable of various subdivisions. Thus the idea of the lowest species may be subdivided into its several individuals, the idea of any genus into the different species it comprehends, and so of the rest. If then we suppose this distribution to be duly made, and so as to take in the whole extent of the idea to which it belongs; then it is plain that all the subdivisions or parts of any idea taken together constitute that whole idea. Thus the several individuals of any species taken together constitute the whole species, and all the various species comprehended under any genus make up the whole genus. This being allowed, it is apparent, that whatever may be affirmed of all the several subdivisions and classes of any idea ought to be affirmed of the whole general idea to which these subdivisions belong. What may be affirmed of all the individuals of any species may be affirmed of the whole species; and what may be affirmed of all the species of any genus may be also affirmed of the whole genus; because all the individuals taken together are the same with the species, and all the species taken together the same with the genus.

99  
The form  
and struc-  
ture of an  
argument  
by induc-  
tion.

XVI. This way of arguing, where we infer universally concerning any idea what we had before affirmed or denied separately of all its several subdivisions and parts, is called reasoning by induction. Thus

if we suppose the whole tribe of animals subdivided into men, beasts, birds, insects, and fishes, and then reason concerning them after this manner: "all men have a power of beginning motion; all beasts, birds, and insects, have a power of beginning motion; all fishes have a power of beginning motion; therefore all animals have a power of beginning motion." The argument is an induction. When the subdivisions are just, so as to take in the whole general idea, and the enumeration is perfect, that is, extends to all and every of the inferior classes or parts; then the induction is complete, and the manner of reasoning by induction is apparently conclusive.

100  
The ground  
of argu-  
mentation  
in a dilem-  
ma.

XVII. The last species of *sylogism* we shall take notice of in this chapter is that commonly distinguished by the name of a *dilemma*. A dilemma is an argument by which we endeavour to prove the absurdity or falsehood of some assertion. In order to this, we assume a conditional proposition, the antecedent of which is the assertion to be disproved, and the consequent a disjunctive proposition, enumerating all the possible suppositions upon which that assertion can take place. If then it appears, that all these several suppositions ought to be rejected, it is plain, that the antecedent or assertion itself must be so too. When therefore such a proposition as that before mentioned is made the major of any *sylogism*; if the minor rejects all the suppositions contained in the consequent, it follows necessarily, that the conclusion ought to reject the antecedent, which, as we have said, is the very assertion to be disproved. This particular way of arguing is that which logicians call a *dilemma*; and from the account here given of it, it appears that we may in the general define it to be a hypothetical *sylogism*, where the consequent of the major is a disjunctive proposition, which is wholly taken away or removed in the minor. Of this kind is the following:

"If God did not create the world perfect in its kind, it must either proceed from want of in-  
clination, or from want of power.

"But it could not proceed either from want of in-  
clination, or from want of power.

"Therefore he created the world perfect in its kind." Or, which is the same thing: "It is absurd to say that he did not create the world perfect in its kind."

XVIII. The nature then of a dilemma is universally this. The major is a conditional proposition, whose consequent contains all the several suppositions upon which the antecedent can take place. As therefore these suppositions are wholly removed in the minor, it is evident that the antecedent must be so too; inasmuch that we here always argue from the removal of the consequent to the removal of the antecedent. That is, a dilemma is an argument in the *modus tollens* of hypothetical *sylogisms*, as logicians love to speak. Hence it is plain, that if the antecedent of the major is an affirmative proposition, the conclusion of the dilemma will be negative; but if it is a negative proposition, the conclusion will be affirmative.

101  
An univer-  
sal descrip-  
tion of it.

#### CHAP. V. Of Demonstration.

I. HAVING dispatched what seemed necessary to be said with regard to the forms of *sylogisms*, we now proceed

102  
Of reason-  
ing by a  
concatena-  
tion of syllo-  
gisms.

proceed to explain their use and application in reasoning. We have seen, that in all the different appearances they put on, we still arrive at a just and legitimate conclusion: now it often happens, that the conclusion of one syllogism becomes a previous proposition in another; by which means great numbers of them are sometimes linked together in a series, and truths are made to follow one another in train. And as in such a concatenation of syllogisms all the various ways of reasoning that are truly conclusive may be with safety introduced; hence it is plain, that in deducing any truth from its first principles, especially where it lies at a considerable distance from them, we are at liberty to combine all the several kinds of arguments above explained, according as they are found best to suit the end and purpose of our inquiries. When a proposition is thus by means of syllogisms collected from others more evident and known, it is said to be *proved*: so that we may in the general define the proof of a proposition to be a syllogism, or series of syllogisms, collecting that proposition from known and evident truths. But more particularly, if the syllogisms of which the proofs consist admit of no premises but definitions, self-evident truths, and propositions already established, then is the argument so constituted called a *demonstration*; whereby it appears that demonstrations are ultimately founded on definitions and self-evident propositions.

103  
All syllo-  
gisms what-  
soever reducible to the first figure.

II. All syllogisms whatsoever, whether compound, multimform, or defective, are reducible to plain simple syllogisms in some one of the four figures. But this is not all. Syllogisms of the first figure, in particular, admit of all possible conclusions: that is, any propositions whatsoever, whether an universal affirmative or universal negative, a particular affirmative or particular negative, which fourfold division embraces all their varieties; any one of these may be inferred by virtue of some syllogism in the first figure. By this means it happens that the syllogisms of all the other figures are reducible also to syllogisms of the first figure, and may be considered as standing on the same foundation with them. We cannot here demonstrate and explain the manner of this reduction, because it would too much swell the bulk of this treatise. It is enough to take notice that the thing is universally known and allowed among logicians, to whose writings we refer such as desire farther satisfaction in this matter. This then being laid down, it is plain that any demonstration whatsoever may be considered as composed of a series of syllogisms, all in the first figure. For, since all the syllogisms that enter the demonstration are reducible to syllogisms of some one of the four figures; and since the syllogisms of all the other figures are farther reducible to syllogisms of the first figure, it is evident, that the whole demonstration may be resolved into a series of these last syllogisms. Let us now, if possible, discover the ground upon which the conclusion rests in syllogisms of the first figure; because, by so doing, we shall come at an universal principle of certainty, whence the evidence of all demonstrations in all their parts may be ultimately derived.

III. The rules then of the first figure are briefly these. The middle term is the subject of the major

proposition, and the predicate of the minor. The major is always an universal proposition, and the minor always affirmative. Let us now see what effect these rules will have in reasoning. The major is an universal proposition, of which the middle term is the subject, and the predicate of the conclusion the predicate. Hence it appears, that in the major the predicate of the conclusion is always affirmed or denied universally of the middle term. Again, the minor is an affirmative proposition, whereof the subject of the conclusion is the subject, and the middle term the predicate. Here then the middle term is affirmed of the subject of the conclusion; that is, the subject of the conclusion is affirmed to be comprehended under, or to make a part of, the middle term. Thus then we see what is done in the premises of a syllogism of the first figure. The predicate of the conclusion is universally affirmed or denied of some idea. The subject of the conclusion is affirmed to be or to make a part of that idea. Hence it naturally and unavoidably follows, that the predicate of the conclusion ought to be affirmed or denied of the subject. To illustrate this by an example, we shall resume one of the syllogisms of the first chapter.

“ Every creature possessed of reason and liberty is accountable for his actions.

“ Man is a creature possessed of reason and liberty: Therefore man is accountable for his actions.”

Here, in the first proposition, the predicate of the conclusion *accountable* is affirmed of all creatures that have reason and liberty. Again, in the second proposition, *man*, the subject of the conclusion, is affirmed to be or to make a part of this class of creatures. Hence the conclusion necessarily and unavoidably follows, *viz.* that man is accountable for his actions; because, if reason and liberty be that which constitutes a creature accountable, and man has reason and liberty, it is plain he has that which constitutes him accountable. In like manner, where the major is a negative proposition, or denies the predicate of the conclusion universally of the middle term, as the minor always asserts the subject of the conclusion, to be or make a part of that middle term, it is no less evident that the predicate of the conclusion ought in this case to be denied of the subject. So that the ground of reasoning, in all syllogisms of the first figure, is manifestly this: “ Whatever may be affirmed universally of any idea, may be affirmed of every or “ any number of particulars comprehended under that “ idea.” And again: “ Whatever may be denied “ universally of any idea, may be in like manner denied of every or any number of its individuals.” These two propositions are called by logicians the *dictum de omni*, and *dictum de nullo*; and are indeed the great principles of syllogistic reasoning, inasmuch as all conclusions whatsoever either rest immediately upon them, or upon propositions deduced from them. But what adds greatly to their value is, that they are really self-evident truths, and such as we cannot gain say without running into an express contradiction. To affirm, for instance, that *no man is perfect*, and yet argue that *some men are perfect*; or to say that *all men are mortal*, and yet that *some men are not mortal*, is to assert a thing to be and not to be at the same time.

IV. And

104  
The ground  
of reason-  
ing in the  
first figure.

105  
Demonstration,  
an infallible  
guide to  
truth and  
certainty.

IV. And now we may affirm, that, in all syllogisms of the first figure, if the premises are true, the conclusion must needs be true. If it be true that the predicate of the conclusion, whether affirmative or negative, agrees universally to some idea; and if it be also true that the subject of the conclusion is a part of or comprehended under that idea; then it necessarily follows, that the predicate of the conclusion agrees also to the subject. For to assert the contrary, would be to run counter to some one of the two principles before established; that is, it would be to maintain an evident contradiction. And thus we are come at last to the point we have been all along endeavouring to establish; namely, that every proposition which can be demonstrated is necessarily true. For as every demonstration may be resolved into a series of syllogisms all in the first figure; and as in any one of these syllogisms, if the premises are true, the conclusion must needs be so too; it evidently follows, that if all the several premises are true, all the several conclusions are so, and consequently the conclusion also of the last syllogism, which is always the proposition to be demonstrated. Now that all the premises of a demonstration are true, will easily appear from the very nature and definition of that form of reasoning. A demonstration, as we have said, is a series of syllogisms, all whose premises are either definitions, self-evident truths, or propositions already established. Definitions are identical propositions, wherein we connect the description of an idea with the name by which we chuse to have that idea called, and therefore as to their truth there can be no dispute. Self-evident propositions appear true of themselves, and leave no doubt or uncertainty in the mind. Propositions, before established, are no other than conclusions gained by one or more steps from definitions and self-evident principles; that is, from true premises, and therefore must needs be true. Whence all the previous propositions of a demonstration being, we see, manifestly true; the last conclusion, or proposition to be demonstrated, must be so too. So that demonstration not only leads to certain truth, but we have here also a clear view of the ground and foundation of that certainty. For as, in demonstrating, we may be said to do nothing more than combine a series of syllogisms together, all resting on the same bottom; it is plain that one uniform ground of certainty runs through the whole, and that the conclusions are every where built upon some one of the two principles before established, as the foundation of all our reasoning. These two principles are easily reduced into one, and may be expressed thus: "Whatever predicate, whether affirmative or negative, agrees universally to any idea; the same must needs agree to every or any number of individuals comprehended under that idea." And thus at length we have, according to our first design, reduced the certainty of demonstration to one simple and universal principle; which carries its own evidence along with it, and which is indeed the ultimate foundation of all syllogistic reasoning.

V. Demonstration therefore serving as an infallible guide to truth, and standing on so sure and unalterable a basis, we may now venture to assert, that the rules of logic furnish a sufficient criterion for the distinguishing between truth and falsehood.

distinguishing between truth and falsehood. For since every proposition that can be demonstrated is necessarily true, he is able to distinguish truth from falsehood who can with certainty judge when a proposition is truly demonstrated. Now a demonstration is, as we have said, nothing more than a concatenation of syllogisms, all whose premises are definitions, self-evident truths, or propositions previously established. To judge therefore of the validity of a demonstration, we must be able to distinguish whether the definitions that enter it are genuine, and truly descriptive of the ideas they are meant to exhibit: whether the propositions assumed without proofs as intuitive truths have really that self-evidence to which they lay claim: whether the syllogisms are drawn up in due form, and agreeable to the laws of argumentation: in fine, whether they are combined together in a just and orderly manner, so that no demonstrable propositions serve any where as premises unless they are conclusions of previous syllogisms. Now it is the business of logic, in explaining the several operations of the mind, fully to instruct us in all these points. It teaches the nature and end of definitions, and lays down the rules by which they ought to be framed. It unfolds the several species of propositions, and distinguishes the self-evident from the demonstrable. It delineates also the different forms of syllogisms, and explains the laws of argumentation proper to each. In fine, it describes the manner of combining syllogisms, so as that they may form a train of reasoning, and lead to the successive discovery of truth. The precepts of logic therefore, as they enable us to judge with certainty when a proposition is duly demonstrated, furnish a sure criterion for the distinguishing between truth and falsehood.

VI. Perhaps it may be objected, that demonstration is a thing very rare and uncommon, as being the prerogative of but a few sciences, and therefore the criterion here given can be of no great use. But wherever, by the bare contemplation of our ideas, truth is discoverable, there also demonstration may be attained. Now that is an abundantly sufficient criterion which enables us to judge with certainty in all cases where the knowledge of truth comes within our reach; for with discoveries, that lie beyond the limits of the human mind, we have, properly, no business or concernment. When a proposition is demonstrated, we are certain of its truth. When, on the contrary, our ideas are such as have no visible connection or repugnance, and therefore furnish not the proper means of tracing their agreement or disagreement, there we are sure that scientific knowledge is not attainable. But where there is some foundation of reasoning, which yet amounts not to the full evidence of demonstration, there the precepts of logic, by teaching us to determine aright of the degree of proof, and of what is still wanting to render it full and complete, enable us to make a due estimate of the measures of probability, and to proportion our assent to the grounds on which the proposition stands. And this is all we can possibly arrive at, or even so much as hope for, in the exercise of faculties so imperfect and limited as ours.

VII. Before we conclude this chapter, it may not be improper to take notice of the distinction of it into direct and indirect.

107  
And extending to all cases where a certain knowledge of truth is attainable.

108  
The distinction of demonstration into direct and indirect.

*rect* and *indirect*. A *direct demonstration* is, when, beginning with definitions, self-evident propositions, or known and allowed truths, we form a train of syllogisms, and combine them in an orderly manner, continuing the series through a variety of successive steps, until at last we arrive at a syllogism whose conclusion is the proposition to be demonstrated. Proofs of this kind leave no doubt or uncertainty behind them; because, all the several premises being true, the conclusions must be so too, and of course the very last conclusion or proposition to be proved. The other species of demonstration is the *indirect*, or, as it is sometimes called, the *apagogical*. The manner of proceeding here is, by assuming a proposition which directly contradicts that we mean to demonstrate; and thence, by a continued train of reasoning, in the way of a direct demonstration, deducing some absurdity or manifest untruth. For hereupon we conclude, that the proposition assumed was false; and thence again, by an immediate consequence, that the proposition to be demonstrated is true. Thus Euclid, in his third book, being to demonstrate that *circles which touch one another inwardly have not the same centre*, assumes the direct contrary to this, viz. that *they have the same centre*; and thence, by an evident train of reasoning, proves that *a part is equal to the whole*. The supposition therefore leading to this absurdity he concludes to be false, viz. that *circles touching one another inwardly have the same centre*; and thence again immediately infers, that *they have not the same centre*.

299  
Ground of reasoning in indirect demonstrations.

VIII. Now, because this manner of reasoning is accounted by some not altogether so clear and satisfactory; we shall therefore endeavour to shew, that it equally with the other leads to truth and certainty. Two propositions are said to be *contradictory* one of another, when that which is asserted to be in the one is asserted not to be in the other. Thus the propositions, *Circles that touch one another inwardly have the same centre*, and *Circles that touch one another inwardly have not the same centre*, are *contradictory*; because the second asserts the direct contrary of what is asserted in the first. Now, in all contradictory propositions, this holds universally, That one of them is necessarily true, and the other necessarily false. For if it be true, that circles which touch one another inwardly have not the same centre; it is unavoidably false, that they have the same centre. On the other hand, if it be false that they have the same centre, it is necessarily true that they have not the same centre. Since therefore it is impossible for them to be both true or both false at the same time; it unavoidably follows, that one is necessarily true, and the other necessarily false. This then being allowed, which is indeed self-evident, if any two contradictory propositions are assumed, and one of them can by a clear train of reasoning be demonstrated to be false; it necessarily follows, that the other is true. For as the one is necessarily true, and the other necessarily false; when we come to discover which is the false proposition, we thereby also know the other to be true.

310  
Indirect demonstrations a sure guide to certainty.

IX. Now this is precisely the manner of an indirect demonstration, as is evident from the account given of it above. For there we assume a proposition which directly contradicts that we mean to demonstrate; and, having by a continued series of proofs shewn it to be false, thence

infer, that its contradictory, or the proposition to be demonstrated, is true. As therefore this last conclusion is certain and unavoidable; let us next inquire after what manner we come to be satisfied of the falsehood of the assumed proposition, that so no possible doubt may remain as to the force and validity of demonstrations of this kind. The manner then is plainly this: Beginning with the assumed proposition, we, by the help of definitions, self-evident truths, or propositions already established, continue a series of reasoning, in the way of a direct demonstration, until at length we arrive at some absurdity or known falsehood. Thus Euclid, in the example before-mentioned, from the supposition that circles touching one another inwardly have the same centre, deduces, that *a part is equal to the whole*. Since therefore, by a due and orderly process of reasoning, we come at last to a false conclusion; it is manifest, that all the premises cannot be true: for, were all the premises true, the last conclusion must be so too, by what has been before demonstrated. Now, as to all the other premises made use of in the course of reasoning, they are manifest and known truths by supposition, as being either definitions, self-evident propositions, or truths previously established. The assumed proposition is that only as to which any doubt or uncertainty remains. That alone therefore can be false; and indeed, from what has been already shewn, must unavoidably be so. And thus we see, that in indirect demonstrations, two contradictory propositions being laid down, one of which is demonstrated to be false, the other, which is always the proposition to be proved, must necessarily be true; so that here, as well as in the direct way of proof, we arrive at a clear and satisfactory knowledge of truth.

311  
A particular case of indirect demonstrations.

X. This is universally the method of reasoning in all *apagogical* or *indirect* demonstrations. But if any proposition is assumed, from which, in a direct train of reasoning, we can deduce its contradictory; the proposition so assumed is false, and the contradictory one true. For if we suppose the assumed proposition to be true, then, since all the other premises that enter the demonstration are also true, we shall have a series of reasoning consisting wholly of true premises; whence the last conclusion or contradictory of the assumed proposition must be true likewise: so that by this means we should have two contradictory propositions both true at the same time, which is manifestly impossible. The assumed proposition therefore, whence this absurdity flows, must necessarily be false; and consequently its contradictory, which is here the proposition deduced from it, must be true. If then any proposition is proposed to be demonstrated, and we assume the *contradictory* of that proposition, and thence directly infer the proposition to be demonstrated; by this very means we know that the proposition so inferred is true. For since from an assumed proposition we have deduced its contradictory, we are thereby certain that the assumed proposition is false; and if so, then its contradictory, or that deduced from it, which in this case is the same with the proposition to be demonstrated, must be true.

XI. We have a curious instance of this in the twelfth proposition of the ninth book of the Elements. Euclid there proposes to demonstrate, that in any series

<sup>112</sup>  
A due  
knowledge  
of the prin-  
ciples of lo-  
gic indis-  
pensably ne-  
cessary to  
make us  
proper  
judges of  
demonstra-  
tion.

of numbers, rising from unity in geometrical progres-  
sion, all the prime numbers that measure the last term  
in the series will also measure the next after unity. In  
order to this, he assumes the contradictory of the pro-  
position to be demonstrated; namely, that some prime  
number measuring the last term in the series does not  
measure the next after unity; and thence, by a continued  
train of reasoning, proves that it actually does  
measure it. Hereupon he concludes the assumed pro-  
position to be false; and that which is deduced from  
it, or its contradictory, which is the very proposition  
he proposed to demonstrate, to be true. Now that  
this is a just and conclusive way of reasoning, is a-  
bundantly manifest from what we have so clearly es-  
tablished above.

XI. Having thus sufficiently evinced the certainty of  
demonstration in all its branches, and shown the rules by  
which we ought to proceed, in order to arrive at a just  
conclusion, according to the various ways of arguing

## P A R T IV.

## O F M E T H O D.

<sup>114</sup>  
The under-  
standing  
sometimes  
employed  
in putting  
together  
known  
truths.

WE have now done with the three first operations  
of the mind, whose office it is to search after  
truth, and enlarge the bounds of human knowledge.  
There is yet a fourth, which regards the disposal and  
arrangement of our thoughts, when we endeavour so  
to put them together as that their mutual connection  
and dependence may be clearly seen. This is what lo-  
gicians call *Method*, and place always the last in order  
in explaining the powers of the understanding; be-  
cause it necessarily supposes a previous exercise of our  
other faculties, and some progress made in knowledge,  
before we can exert it in any extensive degree.

<sup>115</sup>  
Sometimes  
in the search  
and discov-  
ery of such  
as are un-  
known.

II. In this view, it is plain that we must be before-  
hand well acquainted with the truths we are to combine  
together; otherwise, how could we discern their several  
connections and relations, or so dispose of them as  
to show their mutual dependence may require? But it often  
happens, that the understanding is employed, not in  
the arrangement and composition of known truths,  
but in the search and discovery of such as are un-  
known. And here the manner of proceeding is very  
different. We assemble at once our whole stock of  
knowledge relating to any subject, and, after a general  
survey of things, begin with examining them sepa-  
rately and by parts. Hence it comes to pass, that  
whereas, at our first sitting out, we were acquainted  
only with some of the grand strokes and outlines of  
truth; by thus pursuing her through her several  
windings and recesses, we gradually discover those  
more inward and finer touches whence she derives all  
her strength, symmetry, and beauty. And here it  
is, that when, by a narrow scrutiny into things, we  
have unravelled any part of knowledge, and traced it  
to its first and original principles, inasmuch that the  
whole frame and contexture of it lies open to the view  
of the mind; here it is, that, taking it the contrary  
way, and beginning with these principles, we can so  
adjust and put together the parts as the order and me-  
thod of science requires.

III. But as these things are best understood when il-  
lustrated by examples; let us suppose any machine, for

made use of; it is needless to enter upon a particular  
consideration of those several species of false reasoning,  
which logicians distinguish by the name of *sophisms*.  
He that thoroughly understands the form and struc-  
ture of a good argument, will of himself readily discern  
every deviation from it. And although *sophisms*  
have been divided into many classes, which are all  
called by sounding names, that therefore carry in them  
much appearance of learning; yet are the errors  
themselves so very palpable and obvious, that it would  
be lost labour to write for a man capable of being  
misled by them. Here therefore we choose to conclude  
this part of logic; and shall in the next give some  
account of *Method*: which, though inseparable from  
reasoning, is nevertheless always considered by logi-  
cians as a distinct operation of the mind; because  
its influence is not confined to the mere exercise of  
the reasoning faculty, but extends in some degree to  
all the transactions of the understanding.

<sup>113</sup>  
And of it-  
self suffi-  
cient to  
guard us a-  
gainst error  
and false  
reasoning.

instance a watch, presented to us, whose structure and  
composition we are as yet unacquainted with, but  
want, if possible, to discover. The manner of pro-  
ceeding, in this case, is, by taking the whole to pieces,  
and examining the parts separately, one after another.  
When, by such a scrutiny, we have thoroughly in-  
formed ourselves of the frame and contexture of each,  
we then compare them together, in order to judge of  
their mutual action and influence. By this means we  
gradually trace out the inward make and composition  
of the whole, and come at length to discern how parts  
of such a form, and so put together as we found in  
unravelling and taking them asunder, constitute that  
particular machine called a *watch*, and contribute to  
all the several motions and phenomena observable in  
it. This discovery being made, we can take things  
the contrary way, and, beginning with the parts, so  
dispose and connect them as their several uses and struc-  
tures require, until at length we arrive at the whole  
itself, from the unravelling of which these parts re-  
sulted.

<sup>116</sup>  
Illustrated  
by the simi-  
litude of a  
watch.

IV. And as it is in tracing and examining the works  
of art; so is it, in a great measure, in unfolding any part  
of human knowledge: for the relations and mutual  
habitudes of things do not always immediately appear  
upon comparing them one with another. Hence we  
have recourse to intermediate ideas; and, by means of  
them, are furnished with those previous propositions that  
lead to the conclusion we are in quest of. And if it  
so happen that the previous propositions themselves are  
not sufficiently evident, we endeavour, by new middle  
terms, to ascertain their truth; still tracing things  
backward, in a continual series, until at length we  
arrive at some syllogism where the premises are first  
and self-evident principles. This done, we be-  
come perfectly satisfied as to the truth of all the  
conclusions we have passed through, inasmuch as they  
are now seen to stand upon the firm and immovable  
foundation of our intuitive perceptions. And as we  
arrived at this certainty by tracing things backward  
to the original principles whence they flow; so may

<sup>117</sup>  
Ground of  
the analytic  
and synthe-  
tic methods.

we at any time renew it by a direct contrary process, if, beginning with these principles, we carry the train of our thoughts forward until they lead us, by a connected chain of proofs, to the very last conclusion of the series.

<sup>118</sup>  
Division of  
method into  
analytic and  
synthetic.

V. Hence it appears, that, in disposing and putting together our thoughts, either for our own use, that the discoveries we have made may at all times lie open to the review of the mind, or where we mean to communicate and unfold the discoveries to others, there are two ways of proceeding equally within our choice: for we may so propose the truths relating to any part of knowledge, as they presented themselves to the mind in the manner of investigation; carrying on the series of proofs, in a reverse order, until they at last terminate in first principles: or, beginning with these principles, we may take the contrary way, and from them deduce, by a direct train of reasoning, all the several propositions we want to establish. This diversity in the manner of arranging our thoughts gives rise to the twofold division of method established among logicians: for method, according to their use of the word, is nothing else but the order and disposition of our thoughts relating to any subject. When truths are so proposed and put together as they were or might have been discovered, this is called the *analytic method*, or the *method of resolution*; inasmuch as it traces things backward to their source, and resolves knowledge into its first and original principles. When, on the other hand, they are deduced from these principles, and connected according to their mutual dependence, inasmuch that the truths first in order tend always to the demonstration of those that follow; this constitutes what we call the *synthetic method*, or *method of composition*. For here we proceed by gathering together the several scattered parts of knowledge, and combining them into one whole or system, in such manner that the understanding is enabled distinctly to follow truth through all her different stages and gradations.

VI. There is this farther to be taken notice of, inre-

lation to these two species of method; that the first has also obtained the name of the *method of invention*, because it observes the order in which our thoughts succeeded one another in the invention or discovery of truth. The other, again, is often denominated the *method of doctrine or instruction*; inasmuch as, in laying our thoughts before others, we generally choose to proceed in the synthetic manner, deducing them from their first principles. For we are to observe, that although there is great pleasure in pursuing truth in the method of investigation, because it places us in the condition of the inventor, and shews the particular train and process of thinking by which he arrived at his discoveries; yet is it not so well accommodated to the purposes of evidence and conviction. For, at our first setting out, we are commonly unable to divine where the analysis will lead us; inasmuch that our researches are for some time little better than a mere groping in the dark. And even after light begins to break in upon us, we are still obliged to many reviews, and a frequent comparison of the several steps of the investigation among themselves. Nay, when we have unravelled the whole, and reached the very foundation on which our discoveries stand, all our certainty, in regard to their truth, will be found in a great measure to arise from that connection we are now able to discern between them and first principles, taken in the order of composition. But in the synthetic manner of disposing our thoughts, the case is quite different: for as we here begin with the intuitive truths, and advance by regular deductions from them, every step of the procedure brings evidence and conviction along with it; so that, in our progress from one part of knowledge to another, we have always a clear perception of the ground on which our assent rests. In communicating therefore our discoveries to others, this method is apparently to be chosen, as it wonderfully improves and enlightens the understanding, and leads to an immediate perception of truth.

<sup>119</sup>  
Called o-  
therwise the  
method of  
invention,  
and the  
method of  
science.

<sup>120</sup>  
Loboch

Lohu m.

LOHOCH, or Loch, in pharmacy, a composition of a middle consistence between a soft electuary and a syrup, principally used in disorders of the lungs.

LOINS, in anatomy, the two lateral parts of the umbilical region of the abdomen.

LOIRE, the largest river in France, rises in the mountains of the Cevennes, and, after running a course of about 500 miles, falls into the bay of Biscay.

LOLIUM, DARNELL-GRASS; a genus of the digynia order, belonging to the triandria class of plants. The most remarkable species are, 1. The perenne, red darnell, or rye-grass. This is very common in roads and dry pastures. It makes excellent hay upon dry, chalky, or sandy soils. It is advantageously cultivated along with clover, and springs earlier than other grasses; thereby supplying food for cattle at a time when it is most difficult to be obtained. Cows, horses, and sheep, eat it; goats are not fond of it. 2. The temulentum, or white darnell, grows spontaneously in ploughed fields. If the seeds of this species are malted with barley, the ale soon occasions drunkenness; mixed with bread-corn, they produce but little effect

unless the bread is eaten hot. Sheep are not fond of the plant.

LOKMAN the Wise, an eminent philosopher among the Easterns. The Arabians say he was the son of Baura, the son or grandson of a sister or aunt of Job. He was an Ethiopian, and a slave for some time. It is related that he was born in the time of David, and lived till the age of the prophet Jonas. Some suppose him to have been the same with Æsop the mythologist: and indeed we find in the parables or apologies of Lokman in Arabic, many particulars that are seen in Æsop's fables; so that it is not easy to determine whether the Greek or the Arabian are the originals. He is said to have been deformed in his person; but that this defect was sufficiently made up by the perfections of his mind. Some pieces of his are extant; and he was looked upon as so excellent a person, that Mahomet has inserted a chapter of the Koran, called after his name, in which he introduces God as saying, "We heretofore bestowed wisdom on Lokman."—It is related that he got his liberty on the following occasion. His master having given him a bitter

Lokman.

Lollards  
Lombards

melon to eat, he eat it all. His master, surprised at his exact obedience, asked, How it was possible for him to eat such a nauseous fruit? He answered, "I have received so many favours from you, that it is no wonder I should once in my life eat a bitter melon from your hand." This generous answer of the slave struck the master to such a degree, that he immediately gave him his liberty. M. Galland translated all the fables of Lokman, and Bidpai, or Pilpay, a braamin philosopher; which were published at Paris in 1724.

LOLLARDS, a religious sect which arose in Germany about the beginning of the 14th century; so called from its author Walter Lollard, who began to dogmatize in 1315.

LOLLARD, and his followers, rejected the sacrifice of the mass, extreme unction, and penances for sin; arguing that Christ's sufferings were sufficient. He is likewise said to have set aside baptism, as a thing of no effect; and repentance, as not absolutely necessary, &c.—Lollard was burnt alive at Cologne, in 1322. In England, the followers of Wickliff were called, by way of reproach, *Lollards*, from some affinity there was between some of their tenets; though others are of opinion, that the English *Lollards* came from Germany. See WICKLIFFITE. They were solemnly condemned by the archbishop of Canterbury, and the council of Oxford.

LOMBARD (Lambert), an eminent painter, born at Liège in 1500; who, after a diligent study of the antique at Rome, introduced that style of painting among his countrymen, instead of the Gothic. He painted history, architecture, and perspective; and though he could never altogether free himself from his national goût, he is ranked among the best painters of his time. He died in 1560.

LOMBARD (Peter), well known by the title of *Master of the Sentences*, was born at Novara in Lombardy; but being bred at Paris, he distinguished himself so much at that university, that he first had the canonry of Chartres conferred on him, was some time tutor to Philip son of Louis le Gros, and lastly obtained the see of Paris. He died in 1064. His work of the *Sentences* is looked on as the source of the scholastic theology of the Latin church. He wrote also *Commentaries on the Psalms*, and on *St Paul's Epistles*.

LOMBARDS, a Scandinavian nation, who formerly settled in Italy, and for some time made a considerable figure.

2  
Etymology  
of the name.

Their name of *Lombards*, or *Longobards*, is by some derived from the word *lack*, or *lache*, signifying in the German tongue *water*; because the Lombards, while in Scandinavia, lived in marshes, or near the sea. Others think that it comes from the two German words *langen barden*, or *helleborden*, that is, from the long halberds they were supposed to use in war. But Paulus Diaconus their historian, and who was himself a Lombard, tells us, that they were called *Longobards* from the length of their beards. A nation called the *Lombards* is mentioned by Tacitus, Strabo, and Ptolemy; but these are different from the Lombards who afterwards settled in Italy, and are reckoned to be the same with the Gepidæ, whom the Italian Lombards almost exterminated. The Lombards who settled in Italy are

first mentioned by Prosper Aquitanus, bishop of Rhe-  
gium in the year 379. That writer tells us, that about this time the Lombards, abandoning the most distant coasts of the ocean, and their native country Scandinavia, and seeking for new settlements, as they were over-flooded with people at home, first attacked and overcame about this time the Vandals in Germany. They were then headed by two chiefs, Iboreus and Aion; who, dying about the year 389, were succeeded by Agilmund, who is commonly reckoned the first king of the Lombards.

Before the time of Odoacer, the Lombard history affords nothing remarkable; in his time, however, they settled on the Danube, in the country of the Rugians, whom Odoacer had almost totally exterminated or carried into captivity. During their stay in this country, they rendered themselves formidable to the neighbouring nations, and carried on successful wars with the Heruli and Gepidæ. In 526, they were allowed by the emperor Justinian to settle in Pannonia; and here they made war a second time with the Gepidæ. Alboinus, the Lombard king, killed the king of the Gepidæ with his own hand, put their army to the rout, and cut such numbers of them in pieces, that they ceased from that time to be a nation. Having caused the deceased king's head to be cut off, he made a cup of his skull, called in the language of the Lombards *schala*, which he made use of in all public entertainments. However, having taken, among many other captives of great distinction, the late king's daughter, by name *Rofamunda*, he married her after the death of his former wife Clodivinta, the daughter of Clotaire king of France.

By this victory Alboinus gained such reputation, that his friendship was courted by Justinian; and, in consequence of the emperor's application, a body of 6000 Lombards were sent to the assistance of Narfes against the Goths. The success of the Romans in this expedition, the invasion of Italy by the Lombards, and their successes in that country, have been taken notice of under the article ITALY, n° 28—32. At last, Alboinus, having made himself master of Venetia, A'boinus Liguria, Emilia, Hetruria, and Umbria, was slain by king of the treachery of his wife, in the year 575, the fourth of his reign. This princess was the daughter of the king of the Gepidæ, whom Alboinus had killed in gation of battle, and made a cup of his skull, as above related. his wife. As he was one day feasting at Verona with his chief favourites and principal officers, in the height of his mirth he sent for the queen, and, filling the detested cup, commanded her to drink merrily with her father. Rofamund, struck with horror, hurried out of the room; and, highly incensed against her husband for thus barbarously triumphing over the misfortunes of her family, resolved, at all events, to make him pay dear for such an inhuman and affronting conduct. Accordingly, she discovered her intention to Helmichild the king's shield-bearer, a youth of great boldness and intrepidity. Helmichild peremptorily refused to imbrue his hands in the blood of his sovereign, or to be any way accessory to his death; and in this resolution he persisted till he was, by a shameful stratagem, forced by the queen to a compliance: for she, knowing that he carried on an intrigue with one of her

Helmichild, well apprized, that, after what he had done, his safety depended upon the death of the king, engaged in the treason, which he otherwise abhorred. One day, therefore, while Alboinus was reposing in his chamber after dinner, Helmichild, with some others whom he had made privy to his design, breaking in unexpectedly, fell upon the king with their daggers. Alboinus, starting up at their first coming in, laid hold of his sword, which he had always by him; but having in vain attempted to draw it, the queen having beforehand fastened it in the scabbard, he defended himself for some time with a footstool; but was in the end overpowered, and dispatched with many wounds.

Rofamund had promised to Helmichild, that, as soon as he had dispatched the king, she would marry him, and, with her person, bestow upon him the kingdom of the Lombards. The first part of her promise she immediately performed; but was so far from being able to bestow the crown upon him, that both of them were obliged to save themselves by flight. They fled to Longinus the exarch of Ravenna, taking with them all the jewels and treasure of the late king. Longinus received her with the greatest marks of friendship and kindness, and assured her of his protection. She had not been long in Ravenna, however, before the exarch, judging that a favourable opportunity now offered of making himself king of Italy by her means, imparted his design to her, and declared his intention to marry her, provided, by some means or other, she dispatched Helmichild.—Rofamund, highly pleased with the proposal, resolved to satisfy her ambition by getting rid of the person whom she had married in order to gratify her revenge. Accordingly, having prepared a strong poison, she mixed it with wine, and gave it to her husband as he came out of the bath, and called for drink, according to his custom. Helmichild had not half emptied the cup, when, by the sudden and strange operation which he felt in his bowels, he concluded what it was; and, with his sword pointed at the queen's breast, compelled her to drink the rest. The poison had the same effect on both; for they died in a few hours. Longinus, on the death of the queen, laid aside all thoughts of making himself king of Italy, and sent the king's treasure to Constantinople, together with Albigunda the daughter of Alboinus by Rofamund, whom she had brought along with her.

After the death of Alboinus, the Lombards chose Clephis, one of the nobility, for their king. He was murdered after a short reign of 18 months; upon which ensued an interregnum of 10 years, as related under the article ITALY, n° 32. During this time, they extended their conquests in that country; but at last the Romans, jealous of their progress, resolved to put a stop to their victories, and, if possible, to drive them quite out. For this purpose, they designed not only to employ their own force, but entered into alliance with the Franks; which so alarmed the Lombards, that they re-established the monarchical form of go-

vernment among themselves, and chose Autharis the son of Clephis for their king. This monarch, considering that the power of the dukes, who had governed Lombardy for the space of 10 years, was during that length of time very much established, and that they would not probably be willing to part with the authority which they had so long enjoyed, allowed them to continue in their government; but obliged them to contribute one moiety of their revenues towards the maintenance and support of his royal dignity, suffering them to dispose of the other as they thought proper. He referred to himself the supreme dominion and authority; and took an oath of the dukes, that, in time of war, they would readily assist him to the utmost of their power. Though he could remove the dukes at pleasure, yet he deprived none of them of their dukedoms, except in cases of treason; nor gave them to others, except when their male-issue failed. Having settled matters in this manner with the dukes, he enacted several wholesome laws against theft, rapine, murder, adultery, and other vices which prevailed among his subjects; and was the first of the Lombard kings who embraced Christianity. Most of his subjects followed the example of their monarch; but, as they were all instructed by Arian bishops, they continued long infected with that heresy; which occasioned great disputes between them and the orthodox bishops of the cities subject to them.

From the re-establishment of the monarchy under Autharis, to the reign of Rotharis in 636, the history of the Lombards affords nothing memorable. This period is remarkable for the introduction of written laws among these people. Before his time they had been governed only by tradition; but Rotharis, imitation of the Romans and Goths, undertook the publishing of written laws; and to those which he enacted, many were added by the succeeding princes. Grotius prefers the method which the Lombards followed in making laws, to that which was practised by the Romans themselves. Among the latter, the emperor was the sole lawgiver; so that whatever pleased him had the force of a law. But the Lombard kings did not assume that power to themselves, since their laws were enacted in public assemblies, convened for that purpose, after they had been maturely examined and approved of by all the lords of the kingdom. From these assemblies were excluded the ecclesiastic order, and the people; so that the legislative power was lodged in the king and nobles alone.

The reign of Rotharis is remarkable, not only for his introducing written laws among his subjects, but for the conquests he made, and the successful wars carried on with the exarch of Ravenna, whom he totally defeated in several engagements, and made himself master of some part of his territories. This monarch died in 652; and the affairs of the Lombards went on prosperously, till the ambition of Luitprand laid the foundation of the total ruin of his kingdom. He ascended the throne of Lombardy in 711, and watched all opportunities of enlarging his dominions at the expence of the emperors. Of this, a fair opportunity offered in 716: for the emperor Leo Isauricus, who at that time reigned in the east, having, by his famous edict, forbidden the worship of images, and ordered them to be every-where pulled down, the people.

people were so provoked at that innovation, that, in several places, they openly revolted, and, falling upon the emperor's officers, drove them out of the cities. In the east, Germanus patriarch of Constantinople opposed the emperor's design with great warmth; but Leo caused him to be deposed, and Anastasius to be raised to that see in his room, ordering at the same time all the images in the imperial city to be pulled down, and publicly burnt. He strictly enjoined his officers in the west, especially the exarch of Ravenna, to see his edict punctually obeyed in their respective governments. In compliance with these orders, Scholasticus, then exarch, began to pull down the images in all the churches and public places in Ravenna; which incensed the superstitious multitude to such a degree, that, taking arms, they openly declared they would rather renounce their allegiance to the emperor, than the worship of images.

Thus a kind of civil war being kindled in the city, Luitprand thought he had now a favourable opportunity of making himself master of the seat of the exarch, not doubting but the conquest of such an important place would be followed by that of the whole ex-

<sup>11</sup> He besieges archate. Having therefore drawn together all his arch and at last forces, he unexpectedly appeared before Ravenna, and closely besieged it. The exarch little expected such a surprise, as a friendly correspondence had been maintained for many years between the exarchs and the Lombard kings. However, he defended the place with such courage and resolution, that Luitprand, despairing of success, broke up the siege, and led his army against Classis at a small distance from Ravenna, which he took, plundered, and levelled with the ground. The loss of this place, and the severe treatment the inhabitants met with from the king, threw the citizens of Ravenna into the utmost consternation; which Luitprand being informed of, he resolved to take advantage of their fears, and, returning before Ravenna while the inhabitants were thus dilheartened, to attempt once more the reduction of that place. Accordingly he led his whole army against it, and, by frequent attacks, tired the inhabitants and garrison to such a degree, that the exarch, finding they could hold out no longer, and despairing of relief, privately withdrew. Luitprand, informed of his retreat, attacked the town with more violence than ever; and, having carried it by storm, gave it up to be plundered by his soldiers, who found in it an immense booty, as it had been for a long time the seat of the Roman emperors, of the Gothic kings, and the exarchs. The king stripped it of most of its valuable monuments of antiquity, and caused, among the rest, an equestrian statue of an emperor, of wonderful workmanship, to be conveyed to Pavia, where it is to be seen to this day. The reduction of Ravenna was followed by the surrender of several cities

<sup>12</sup> Reduces the of the exarchate, which Luitprand reduced to a dukedom; appointing Hildebrand, his grandson, to govern it with the title of duke; and giving him, as he was yet an infant, Peredeus duke of Vicenza for his guardian.

The conquest of Ravenna and the greater part of the exarchate, did not a little alarm Gregory II. bishop of Rome. He was then at variance with the emperor, whose edict against the worshipping of ima-

ges he had opposed with all his might, and by that means provoked Leo to such a degree, that he had threatened to drive him from the see, and send him into exile. However, the pope, no less jealous of the power of the Lombards, than all his predecessors had been, resolved, by some means or other, to put a stop to their conquests. The only prince in Italy to whom he could have recourse, was Ursus duke of Venice, the Venetians making already no inconsiderable figure. To him accordingly he wrote a very pressing letter; conjuring him to assist his worthy son the exarch, and, for the love of the holy faith, to attempt the recovery of the exarchate, which the wicked nation of the Lombards had unjustly taken from his sons Leo and Constantine emperors. Ursus and the Venetians, moved with the pope's letter, and at the same time greatly alarmed at the growth of so powerful a neighbour, promised to assist the exarch with the whole strength of their republic; and accordingly fitted out a considerable fleet, pretending it was designed for the service of the emperor against the Saracens. At the same time the exarch, who had taken refuge in Venice, abandoning that place, as it were in despair of bringing the duke over to his party, raised, in the places still subject to the emperor, what forces he was able; and, having got together a considerable body, he marched with them towards Imola, giving out that he designed to besiege that city; but, turning on a sudden towards Ravenna, as had been agreed on between him and the Venetians, he laid siege to it by land, while they invested it almost at the same instant by sea. Peredeus defended the town for some time with great courage and resolution; obliging all those who were able to bear arms, to repair to the walls. But the Venetians having, in spite of all opposition, forced open one of the gates on the side of the sea, the city was taken, and Peredeus slain, while he was attempting, at the head of a choice body, to drive the enemy from the posts they had seized. As for Hildebrand, he fell into the hands of the Venetians; who, having thus recovered Ravenna to the emperor, returned home, leaving the exarch in possession of the city. Luitprand was then at Pavia; but the town was taken before he could assemble his troops to relieve it.

And now Gregory bishop of Rome, to whom the recovery of Ravenna was chiefly owing, persuading himself, that the emperor would, out of gratitude, give ear to his remonstrances and admonitions, began to solicit him with more pressing letters than ever to revoke his edict against the worship of images; but Leo, well apprised, that the bishop, in all the measures he had taken, had been more influenced by a regard to his own interest, than to that of the empire, instead of hearkening to his remonstrances, was still more provoked against him for thus obstinately opposing the execution of his edict. Being therefore resolved at all events to have it observed in Rome itself, and, on the other hand, not doubting but the pope would oppose it to the last with all his might; in order to remove all obstacles, he sent three officers to Rome, with private orders, either to dispatch the pope, or to take him prisoner and convey him to Constantinople. At the same time he wrote to Mauritius duke of Rome, secretly enjoining him to assist his three officers

in

<sup>13</sup> The exarch assisted by the Venetians.

<sup>14</sup> Who retake Ravenna.

Lombards. in their undertaking : but no favourable opportunity offering to put their design in execution, the emperor, in the year 725, recalled Scholasticus, and sent Paul a patrician into Italy, to govern in his room, with private instructions to encourage the above-mentioned officers with the promise of great rewards, and to assure them of his protection.

But in the mean time the plot was discovered, and two of the conspirators were apprehended by the citizens of Rome, and put to death; the third having escaped into a monastery, where he took the monastic habit, and ended his days. Hereupon the exarch, in compliance with the emperor's orders, resolved to proceed no longer by secret plots, but by open force. Accordingly, he drew together a considerable body of troops, and set out at the head of them on his march to Rome, with a design to seize on the pope, and send him, as he had engaged to do, in chains to Constantinople. But, on this occasion, Luitprand, though highly provoked against Gregory for having stirred up the Venetians against him, yet relolved to assist him and the citizens of Rome against the exarch, in order to keep the balance even between them, and, by assisting sometimes the one and sometimes the other, weaken both. Pursuant to this resolution, he ordered the Lombards of Tuscany, and those of the dukedom of Spoleto, to join the pope and the inhabitants of Rome; who, being, by this reinforcement, far superior in strength and number to the exarch, obliged him to return to Ravenna, and give over all thoughts of any further attempt on the person of the pope.

In the mean time, Leo, persisting in his former resolution of suppressing throughout his dominions the worship of images, sent fresh orders to the exarch Paul, strictly enjoining him to cause his edict to be put in execution in all the cities of Italy under his empire, especially in Rome. At the same time he wrote to the pope, promising him his favour and protection, if he complied with the edict; and declaring him, if he continued to oppose it, a rebel, and no longer vested with the papal dignity. But Gregory was so far from yielding to the emperor's threats or promises, that, on the contrary, he solemnly excommunicated the exarch for attempting to put the imperial edict in execution; and at the same time wrote circular letters to the Venetians, to king Luitprand, to the Lombard dukes, and to all the chief cities of the empire, exhorting them to continue steadfast in the Catholic faith, and to oppose with all their might such a detestable innovation. These letters made such an impression on the minds of the people in Italy, that, though of different interests, and often at war with one another, they all united; protesting they would defend the Catholic faith, and the life of the pope, in so glorious a cause, at the expense of their own: nay, the citizens of Rome, and the inhabitants of Pentapolis, now Marca d'Ancona, not contenting themselves with such a protestation, openly revolted from the emperor; and, pulling down his statues, they elected, by their own authority, magistrates to govern them during the interregnum. We are even told, that, transported with a blind zeal, they were for choosing a new emperor, and conducting him to Constantinople, not doubting but the people would every-where join them. But the pope, thinking this resolution unfeasonable, and not to be easily

put in execution, opposed it; so that it did not take place.

In the mean time, the exarch Paul, having gained a considerable party in Ravenna, began, pursuant to the repeated orders from the emperor, to remove the images, as so many idols, out of the churches. Hereupon the adverse party, supported and encouraged by the pope, flew to arms; and, falling upon the *iconoclasts* or image-breakers, as they styled them, gave rise in Ravenna, <sup>16</sup> to a civil war within the walls of Ravenna. Great numbers were killed on both sides: but those who were for the worship of images prevailing in the end, a dreadful slaughter was made of the opposite party; and, among the rest, the exarch himself was murdered. However, the city of Ravenna continued faithful to the emperor; but most of the cities of Romagna belonging to the exarchate, and all those of Pentapolis or La Marca d'Ancona, abhorring the emperor as an heretic, submitted to Luitprand king of the Lombards; who, pretending a zeal for the Catholic religion, took care to improve the discontent of the people to his advantage, by representing to them, that they could never maintain their religious rights under a prince, who was not only an heretic, but a persecutor of the orthodox.

In Naples, Exhilaratus, duke of that city, having received peremptory orders from the emperor to cause his edict to be put in execution, did all that lay in his power to persuade the people to receive it; but finding all his endeavours thwarted by the bishop of Rome, for whom the Neapolitans had a great veneration, he hired assassins to murder him. But the plot being discovered, though carried on with great secrecy, the Neapolitans, highly provoked against the duke, tore both him and his son to pieces, and likewise put to death one of his chief officers, who had composed a libel against the pope. Luitprand, and Gregory at that time duke of Benevento, laying hold of so favourable an opportunity to make themselves masters of the dukedom of Naples, did all that lay in their power to persuade the Neapolitans to submit to them. But the Neapolitans, bearing an irreconcilable hatred to the Lombards, with whom they had been constantly at variance, rejected every overture of that nature with the utmost indignation; and, continuing steadfast in their allegiance to Leo, received from Constantinople one Peter, who was sent to govern them in the room of Exhilaratus. Some writers suppose the Neapolitans, in this general revolt of the cities of Italy, to have shaken off the yoke with the rest, and to have appointed magistrates of their own election to govern them, in the room of the officers hitherto sent from Constantinople, or named by the exarch: but they are certainly mistaken; it being manifest from history, that Peter succeeded Exhilaratus in that dukedom, and that the Neapolitans continued to live under the emperors till they were conquered many years after by the Normans.

In the mean time, Leo hearing of the murder of the exarch, and the general revolt of the cities, and not doubting but the pope was the chief author of so much mischief, sent the eunuch Eutychius into Italy, with the title and authority of *exarch*, strictly enjoining him to get the pope dispatched by some means or other, since his death was absolutely necessary for the tran-

Lombards. tranquillity of Italy. The exarch spared no pains to get the pope into his power: but a messenger, whom he had sent to Rome, being apprehended by the citizens, and an order from the emperor being found upon him to all his officers in that city, commanding them to put the pope to death at all events, the pope's friends thenceforth guarded him with such care, that the exarch's emissaries could never afterwards find an opportunity of executing their design. As for the messenger, the Romans were for putting him to death; but the pope interposed, contenting himself with excommunicating the exarch.

17  
The Romans re-  
volt.

And now the Romans, provoked more than ever against Leo, and, on the other hand, unwilling to live under the Lombards, resolved to revolt from the emperor, and appoint their own magistrates, keeping themselves united under the pope, not yet as their prince, but only as their head. This they did accordingly; and from these slender beginnings the sovereignty of the popes in Italy took its rise, though they did not then, as is commonly supposed by historians, but many years after, become sovereign lords of Rome.

Eutychius failed in his design upon the life of the pope; but, having brought with him from Constantinople a good number of troops, he easily quelled the rebellion in Ravenna, and severely punished the authors of the late disturbances. As for the rebellious Romans, he was well apprised he could never reduce them, so long as they were supported by the king of the Lombards; and therefore he employed all his art and policy to take off that prince from the party of the Romans, and bring him over to his own.

18  
Luitprand  
concludes  
an alliance  
with the  
exarch.

Luitprand, for some time, withstood all his offers; but Thrasimund duke of Spoleto revolting at this very juncture, the exarch, laying hold of that opportunity, offered to assist the king with all his strength against the rebellious duke, provided he would, in like manner, assist him against the pope and the Romans. With this proposal Luitprand readily closed; and a league being concluded upon these terms between him and the exarch, the two armies joined, and began their march towards Spoleto. At their approach, the duke, despairing of being able to resist two such powers, came out with a small attendance to meet them, and, throwing himself at the king's feet, sued, in that humble posture, for pardon; which Luitprand not only granted him, but confirmed him in the dukedom, after he had obliged him to take a new oath of allegiance, and give hostages for his fidelity in time to come. From Spoleto the two armies marched, in pursuance of the treaty, to Rome; and encamped in the meadows of Nero, between the Tiber and the Vatican.

19  
The pope  
submits to  
Luitprand.

Gregory had caused the city of Rome to be fortified in the best manner he could: but, being sensible that the Romans alone could not long hold out against two such armies, and reflecting on the kind treatment the duke of Spoleto had met with upon his submitting to the king, he resolved to follow his example; and accordingly, taking with him some of the clergy, and the principal inhabitants of the city, he went to wait on the king in his camp; and there, with a pathetic speech, as he was a great master of eloquence, softened Luitprand to such a degree, that, throwing him-

self at his feet in the presence of the whole army, Lombards, he begged pardon for entering into an alliance against him: and, assuring him of his protection for the future, he went with him to the church of St Peter; and there, disarming himself in the presence of his chief officers, he laid his girdle, his sword, and his gantlet, with his royal mantle, his crown of gold, and cross of silver, on the apostle's sepulchre. After this, he reconciled the pope with the exarch, who was thereupon received into the city, where he continued for some time, maintaining a friendly correspondence with the pope. At this time an impostor, taking the name of *Tiberius*, and pretending to be descended from the emperors, seduced a great many people in Tuscany, and was by them proclaimed emperor. The exarch resolved to march against him; but, as he had not sufficient forces to oppose the rebels, Gregory, who let no opportunity slip of obliging Leo, persuaded the Romans to attend the exarch in this expedition; by which means the usurper being taken in a castle, his head was sent to the emperor, and the rebellion utterly suppressed. But, the emperor still insisting upon his edict against the images being received in Rome, the Romans, at the instigation of the pope, publicly renounced their allegiance to Leo, paid him no more tribute, and withdrew for ever their obedience to the emperors of the east.

20  
The emperor  
seizes the  
dominions  
of the pope.

Leo, informed of this revolt, and not questioning but the pope was the author of it, immediately caused all the patrimonies of the church of Rome in Sicily, Calabria, and his other dominions, to be confiscated. At the same time he ordered a powerful army to be raised, with a design to recover the towns that had revolted; to chastise the Romans for their rebellion; and, above all, to be revenged on the pope, who had raised all these disturbances, by opposing himself, and persuading others to oppose, the execution of his edict. Gregory, alarmed at the warlike preparations that were carrying on throughout the empire, and well apprised that they were chiefly designed against him and the Romans, resolved to recur to the protection of the French, the only nation at that time capable of coping with the emperor, and on whom, on account of their zeal for religion, he thought he might depend. The Lombards were then very powerful; but, as they wanted to be masters of Rome, he did not think it advisable to trust them. The Venetians, though zealous in the defence of the pope, were not yet in a condition to withstand the power of the emperor; and, besides, were jealous of the Lombards, who watched all opportunities of enlarging their dominions at the expense of their neighbours. As for Spain, it was then in a most deplorable condition, being over-run, and almost wholly ruined, by the Saracens.

The French nation was at this time governed by who appeared the celebrated Charles Martel, who had distinguished himself in a most eminent manner in the wars of France, France and Germany; and had, not long before, gained a signal victory over the Saracens in the neighbourhood of Tours; whence he was generally reputed the best commander, and the greatest hero, of his time. To him therefore Gregory sent a solemn embassy, with a great number of relics, earnestly intreating him to take the Romans, and the church, under

21

Lombards  
||  
Loch-  
Lomond.

der his protection, and defend them against the attempts of Leo. The embassadors were received with extraordinary marks of honour; and a treaty was soon concluded between them and Charles, who engaged to march into Italy in person, at the head of a powerful army, in defence of the Romans and the church, if they should be attacked either by the emperor or the Lombards. On the other hand, the Romans were to acknowledge him for their protector, and confer on him the honour of the consulship, as it had been formerly conferred on Clovis by the emperor Anastasius, after that prince had defeated the Visigoths. The embassadors returned from France loaded with rich presents. But Gregory did not long enjoy the fruit of their negotiations; for he died the same year 731, and was succeeded by Gregory III. in whose time some place the above-mentioned embassy.

22  
End of the  
Lombard  
monarchy.

The French nation was at this time just recovered from its distressed situation under the descendants of Clovis; and, by the bravery and conduct of Charles Martel, had become the most powerful kingdom in the west. His successor Pepin, was no less wife and powerful than his father had been; and as the ambition of the Lombard princes would be satisfied with nothing less than the entire conquest of Italy, the French monarch, Charlemagne, under colour of assisting the pope, at last put an end to the empire of Lombardy, as related under the article FRANCE, n° 21, 22.

23  
Character,  
&c. of the  
Lombards.

The Lombards were at first a cruel and barbarous nation; but, diverting themselves by degrees of their native fierceness and barbarity, especially after they had embraced the Christian religion, they governed with such equity and moderation, that most other nations envied the happiness of those who lived under them. Under the government of the Lombards, says Paulus Diaconus, no violence was committed, no one unjustly dispossessed of his property, none oppressed with taxes; theft, robberies, murder, and adultery, were seldom heard of: every one went, without the least apprehension, wherever he pleased. Their laws were so just and equitable, that they were retained in Italy, and observed there, some ages after their kingdom was at an end.—According to Paulus Diaconus, also, their dress was loose, and for the most part of linen, such as the Anglo-Saxons wore, being interwoven with various colours; that their shoes were open to the end of their foot, and that they used to button or lace them. From some ancient paintings, it appears, that they shaved the back part of their heads; but that their hair was long before; their locks being parted, and laid on each side their foreheads.

**LOMENTACEÆ**, in botany, (from *lomentum*, a colour used by painters), the name of the 33d order in Linnæus's fragments of a natural method, consisting of the following genera, many of which furnish beautiful tinctures that are used in dyeing, viz. *adenanthera*, *banhinia*, *calalpinia*, *castia*, *ceratonia*, *cercis*, *gledit-fia*, *gulangidina*, *hematoxylon*, *hymenæa*, *mimola*, *parkinsonia*, *poinciana*, *polygama*. See BOTANY, p. 1311.

**LOCH LOMOND**, a large lake of Dunbarton or Lennox shire in Scotland, of which Mr Pennant gives the following description. "Loch-lomond, the last, the most beautiful of the Caledonian lakes. The first view of it from Tarbat presents an extensive serpentine

winding amidst lofty hills; on the north, barren, black, and rocky, which darkens with their shade that contracted part of the water. On the west side, the mountains are clothed near the bottoms with woods of oak quite to the water-edge; their summits lofty, naked, and craggy. On the east side, the mountains are equally high; but the tops form a more even ridge parallel to the lake, except where Ben-lomond, like Saul amidst his companions, overtops the rest. The upper parts were black and barren; the lower had great marks of fertility, or at least of industry, for the yellow corn was finely contrasted with the verdure of the groves intermixed with it.

Loch-  
Lomond.

"This eastern boundary is part of the Grampian hills, which extend from hence through the counties of Perth, Angus, Meams, and Aberdeen. The road runs sometimes through woods, at others is exposed and naked; in some, so steep as to require the support of a wall; the whole the work of the soldiery; blessed exchange of instruments of destruction for those that give safety to the traveller, and a polish to the once inaccessible native!—Two great head-lands covered with trees separate the first scene from one totally different; the last is called the *Point of Firkin*. On passing this cape an expanse of water bursts at once on your eye, varied with all the softer beauties of nature. Immediately beneath is a flat covered with wood and corn; beyond, the headlands stretch far into the water, and consist of gentle risings; many have their surfaces covered with wood, others adorned with trees loosely scattered either over a fine verdure, or the purple bloom of the heath. Numbers of islands are dispersed over the lake, of the same elevated form as the little capes, and wooded in the same manner; others just peep above the surface, and are tufted with trees; and numbers are so disposed as to form magnificent vistas between.

"Opposite Luls, at a small distance from shore, is a mountainous isle almost covered with wood; is near half a mile long, and has a most fine effect. I could not count the number of islands, but was told there are twenty-eight; the largest two miles long, and stocked with deer.

"The length of this charming lake is 24 Scotch miles; its greatest breadth, eight; its greatest depth, which is between the point of Firkin and Ben-lomond, is 120 fathoms. Besides the fish common to the lochs are guinids, called here *poans*.

"The surface of Loch-lomond has for several years past been observed gradually to increase, and invade the adjacent shore: and there is reason to suppose that churches, houses, and other buildings, have been lost in the water. Near Luls is a large heap of stones at a distance from the shore, known by the name of the old church; and about a mile to the south of that, in the middle of a large bay, between Camfraddan and the isle Inch-lavanack, is another heap, said to have been the ruins of a house. To confirm this, it is evident by a passage in Cambden's Atlas Britannica, that an island, existing in his time, is now lost; for he speaks of the isle of Camfraddan, placed between the lands of the same name and Inch-lavanack, in which, adds he, was an house and orchard. Besides this proof, large trees with their branches still adhering are frequently found in the mud near the shore,

<sup>1</sup> London, overwhelmed in former times by the increase of water. This is supposed to be occasioned by the vast quantities of (stone and gravel) that is continually brought down by the mountain rivers, and by the falls of the banks of the Leven; the first filling the bed of the lake, the last impeding its discharge through the bed of the river.

"Mr Golborne, at the request of the several proprietors, has made a voyage and survey of the lake, in order to plan some relief from the incroachment of the water. He proposes to form a constant navigation down the Leven, by deepening the channel, and cutting through the neck of two great curvatures: which will not only enable the inhabitants of the environs of Loch-lomond to convey their slate, timber, bark, &c. to the market; but also, by lowering the surface of the lake, recover some thousands of acres now covered with water."

LONDON, a large city of Middlesex in England, the metropolis of Great Britain, and one of the most wealthy and populous places in the world, is situated on the river Thames, in Long. 000. N. Lat. 51. 32.

<sup>2</sup> The most ancient name of this city is *Londinium*, or *Lundinium*, according to Ammianus. It was then changed into *Augusta*, in honour, as some say, of Helena Augusta, the mother of Constantine the Great; while others think it more probable that it had this name from the second legion, whose peculiar title was *Augusta*; and some imagine that the honourable appellation of *Augusta*, was conferred upon this city by the Romans, as upon other principal cities of their empire, on account of its being grown up to be the capital of their British province. How long the name of *Augusta* prevailed is not now certainly known; but after the establishment of the Saxons we find no more mention of *Augusta*. It was then called *Caer Lundain*, *Lundoun* Byrig, *Lunden* Gæstler, *Lunden-ryge*, *Lundenne*, *Lunden-berh*, or *Lundenburg*; and since the conquest the records call it *Londonia*, *Lundonia*, *Londine*, *Londrei*, and, for several ages past, *London*, a manifest corruption from Tacitus's *Londinium*. The most probable derivation of these names, according to Mr Entick, is from the British words *lhong*, "a ship," and *dinas*, "a city;" i. e. a city or harbour for ships; for which, it appears from Tacitus, to have been famous from its first foundation.

<sup>3</sup> When founded. The city of London cannot be reckoned more ancient than the time of Julius Cæsar. Geoffrey of Monmouth indeed relates, that, before the Roman invasion, London was a town encompassed with walls, and fortified with innumerable towers: but herein he deserves no credit; for Cæsar informs us, that in his time the Britons had no other towns than thick woods surrounded with a ditch, and fortified with a rampart. The foundation of the town is with the greatest probability ascribed to Ostorius Scapula, about the year 49, for the security of the Roman allies, who were before too much exposed to the incursions of the Britons. It is indeed conjectured, and that not without a great degree of probability, that at this time the river Thames, by reason of the great spreading of its waters, was fordable at the place where London now stands, and that London was built particularly with a view to secure and command this ford. The embanking of the river, and the stoppage of the tide at Lon-

don bridge, have greatly increased the depth of the water since that time, so that it is now very far from being fordable there.

At first, London had no walls or other fortifications <sup>4</sup> Burnt by to defend it, and was therefore exposed to the attacks the Britons.

of every enemy; and thus it suffered severely about the year 64, being burnt by the Britons under Boadicea, and all the inhabitants massacred. Soon after this, however, it was restored by the Romans, and increased so much, that in the reign of the emperor Severus it is called by Herodian, a great and wealthy city. About the same time it was made a Roman prefecture, in imitation of Rome itself; whose prefect was sent annually to do justice, and to act in all public matters, such as taxes, tributes, imposts, and military affairs, as directed by the Roman senate. It continued in a defenceless state till the year 296, or 298, when walls were built round it on the following occasion. The

<sup>4</sup> Surrounded with walls.

province of Britain had for some time been dismembered from the empire by Carausius, who revolted from the emperors Dioclesian and Maximian; but he being murdered by one Caius Allectus, a Roman army was dispatched against this new usurper. Allectus called in the Franks to support him; but being defeated and killed, his allies determined to plunder the city of London: but while they were busy in so doing, the Romans arrived, and cut them all in pieces. To prevent disasters of a similar kind for the future, a wall of hewn stone and British bricks was erected round the city. It was three miles and 165 feet in circumference; the figure quadrangular, but not equilateral, the sides being longer from east to west than from north to south. The vestiges of this wall are still to be seen. In the Saxon times, and probably from its first foundation, it extended along the side of the river; and if it is not at present possible to trace the foundations along the river-side, this may justly be supposed owing to the many and great encroachments made by wharfs, which are continually gaining upon it, so that now they advance as far as the fourth pier of London bridge.

<sup>5</sup> Dr Woodward's account of these walls. Dr Woodward, in his Roman Antiquities and Present State of London, informs us, that he had an opportunity of examining the fabric and composition or materials of which these walls were built, from digging at Bishop's-gate for the foundation of certain houses to be erected in 1707. He writes, that the said wall, from the foundation, eight feet below the present surface, quite up to the top, which was in all ten feet more, was compiled alternately of layers of broad slate, bricks, and of rag-stones. The bricks lay in double ranges; and each brick being but one inch and three tenths in thickness, the whole layer, with the mortar interposed, exceeded not three inches. The layers of stone were not quite two feet thick of our measure. This was the height of the Roman work; and these were the remains of the ancient Roman wall supposed to be built by Constantine the Great. It was here very observable, that the mortar was, (as usual in the Roman work,) so very firm and hard, that the stone itself as easily broke, and gave way as soon as it. Thus far from the foundation upwards, it was nine feet in thickness: the broad thin bricks were all of Roman make, and of the very sort, as we learn from Pliny, that were in common use among that people; being in length a foot and an half of their standard, and in breadth

<sup>1</sup>London. breadth a foot. Dr Woodward found them 17 inches four-tenths in length, 11 inches six-tenths in breadth, and one inch three-tenths in thickness. On the land-side the city-wall was strengthened and embellished with stately towers; the remains of 15 of which are still to be seen. Dr Woodward discovered one built in the same manner and of the same materials as the wall, 26 feet high, in three stories, behind a house facing Gravel-lane in Hounditch; but much decayed. In searching for this tower, Mr Entick and Mr Maitland found out another, about 80 yards nearer Aldgate, of the same Roman construction, 21 feet high, perfectly found, and much more beautiful: the bricks were as found as when new laid; but most of the stones were decaying, having lain, according to the most probable computation, 1459 years.

<sup>6</sup>Submits to the Saxons, and becomes the metropolis of England.

The wall of London was finished about the year 306, and about the same time also it is very probable that a bridge was erected at the place where London-bridge stands; for it is not to be supposed that the city had no commerce with the country south of the river, and a ferry could not by any means be thought adequate to the business. Till the year 457, nothing remarkable happened to the city of London. It was then forced to submit to the Saxons, and became the chief city of the kingdom of Essex; and though it suffered much in the wars carried on between the Britons and Saxons, it soon recovered, so that Bede calls it a *princely mart-town*, under the government of a chief magistrate, whose title of *portgrave*, or *portreeve*, (for we find him called by both names), conveys a grand idea of the mercantile state of London in those early ages, that required a governor or guardian of the port. During the civil wars of the Saxons with each other, the Londoners had always the address to keep themselves neuter; and about the year 819, when all the seven Saxon kingdoms fell under the power of Egbert, London became the metropolis of England, which it has ever since continued.

<sup>7</sup>Plundered by the Danes.

During the invasions of the Danes, London suffered greatly. In 849, these invaders entered the Thames with 250 ships, plundered and burnt the city, and massacred the inhabitants; and two years after they returned with a fleet of 350 sail, fully determined to destroy every thing that had escaped their barbarity in the former expedition. At this time, however, they were disappointed; most of their troops being cut in pieces by king Ethelwolf and his son Athelbald; yet such was the destruction made by those barbarians at London, that it suffered more from these two incursions than ever it had done before.

<sup>8</sup>Recovers under Alfred the Great.

In the reign of king Alfred the Great, London began to recover from its former ruinous state. He rebuilt its walls, drove out the Danish inhabitants who had settled there, restored the city to its former liberties and beauty, and committed the care of it to his son-in-law, Ethelred duke of Mercia, in hopes that this might always be a place of secure retreat within its strong walls, whatever might happen from a foreign or domestic enemy. In 893, however, he had the mortification to see his capital totally reduced to ashes by an accidental fire, which could not be extinguished, as the houses at that time were all built of wood. The walls, however, being constructed of incombustible materials, continued to afford the same protection as be-

<sup>9</sup>Reduced to ashes.

fore; the houses were quickly rebuilt, and the city divided into wards and precincts for its better order and government. This king also instituted the office of sheriff, the nature of which office made it necessary to have it also in London: so that here we have the glimmerings of the order of magistrates afterwards settled in the city of London; in the person of the portreeve, or portgrave, or governor of the city, as supreme magistrate; in the sheriff, and in the officer or subordinate magistrate by what name soever then distinguished, which, being placed at the head of each ward or precinct, were analogous to the more modern title of *aldermen and common-council men*.

<sup>11</sup>Brick and stone houses first erected.

Alfred having settled the affairs of England in the most prudent manner, directed his attention to the ornamenting, as much as possible, the city of London. For this purpose, he spirited up the English to an emulation in building their houses of stronger and more durable materials than formerly. At that time their houses were mostly of wood; and an house built of any other materials was looked upon as a kind of wonder. But Alfred having begun to raise his palaces of stone and brick, the opulent Londoners, and the nobility resident in and about London followed the example, though the custom did not come into general use till some ages after.

In 1015, a foreign enemy again appeared before London. Canute king of Denmark having invaded and plundered the counties of Dorset, Somerset, and Wilts, sailed up the Thames with 200 ships, and laid siege to the city. The citizens continued faithful, notwithstanding the defection of the greatest part of the kingdom; and made such a brave resistance, that Canute thought fit to withdraw his army, leaving only his fleet to blockade the city by water, that when he found a fair opportunity he might renew the siege with better success. At last, however, being defeated in several battles by Edmund Ironside, he was obliged to call off his ships to cover his own army in case of necessity. In the compromise, however, which was afterwards made between Edmund and Canute, the city of London was given to the latter, and owned him for its lawful sovereign. We have a strong proof of the opulence of London even at this time, from the tax laid upon it by Canute in order to pay his army; this being no less than 10,500*l*. while the rest of the nation was at the same time taxed only at 72,000*l*.

In 1046, we have the first instance of the Londoners sending representatives to parliament. This happened on settling the succession to the throne after Canute's death. The English in general declared for Edward son of king Ethelred, or, if that could not be carried, for Hardicanute, son of Canute by queen Emma, and then absent on a tour to Denmark. The city of London espoused the claim and interest of Harold Harefoot, son also of Canute by queen Elgiva of Northampton. Edward's party soon declined; and the Londoners agreed, for the peace of the realm, that the two brothers should divide the kingdom between them; but as Hardicanute did not return in proper time to England, a *wittenage-mote* was held at Oxford, where earl Leofric, and most of the thanes on the north of the Thames, with the pilots of London, chose Harold for their king. Here, by *pilots* we are to understand the directors, magistrates, or leading

<sup>13</sup>Sends representatives to parliament.

London. men of the city; and this manifestly shews, that London was then of such consequence, that no important national affair was transacted without the consent of the inhabitants; for the Saxon annals assure us, that none were admitted into this assembly of election but the nobility and the pilots of London.

34  
Suffers  
greatly by  
fires, hurri-  
cane, &c.

On the invasion of the Normans under William I. London submitted as well as the rest of the kingdom; and received two charters from that prince, confirming all the privileges they had under the Saxon kings, and adding several new ones. But while the citizens were promising themselves all manner of security and tranquillity under the new government, it was almost entirely reduced to ashes by an accidental fire in 1077. It had scarcely recovered from this calamity, when it was visited by another of the same kind in 1086, which began at Ludgate, and destroyed the best and most opulent part of the city; consuming, among other buildings, the cathedral of St Paul's; which, however, was soon rebuilt more magnificently than before. Under the reign of William Rufus, London suffered considerably by fires, hurricanes, and inundations, and seems to have been depressed by the tyranny of that prince; but Henry I. granted large immunities to the city, which again revived its trade, and was favourable to the progress of the arts. The king, however, still retained the privilege of appointing the portreeve, or chief magistrate; but the immunities granted to the Londoners secured their affections, and tended much to secure him on the throne. At the same time there was such a plenty of all kinds of provisions, that as much corn was sold for 1 s. as would suffice 100 people for a day; 4 d. would purchase as much hay and corn as would maintain 20 horses for a day; and a sheep could be bought for a groat.

35  
Monstrous  
licentious-  
ness of the  
Normans.

Henry thought proper also to check the licentious behaviour of the Normans, which, by the favour shewed them under the two Williams, had carried them into the most barbarous practices. Those who followed William Rufus in his excursions, harassed and plundered the country at discretion. Many of them were so extravagant in their barbarity, that what they could not eat or drink in their quarters, they either obliged the people to carry to market and sell for their use, or else they would throw it into the fire; and, at their going off, they frequently washed their horses heels with the drink, and flaved the casks containing the remainder. King Henry resolved to put a stop to these excesses and savage customs; and therefore published a proclamation at London, commanding that thenceforward all persons who should be convicted of such barbarities should have their eyes pulled out, or their hands or feet cut off, as the ministers of justice should think fit. This effectually checked the insolence of the Normans, and the city continued to flourish throughout the reigns of Henry I. and Stephen. The attachment of the citizens to Stephen, however, was a crime which never could be forgiven by Henry II. and of consequence he made them sensible of his displeasure by making frequent demands of money from them. About this time, indeed, the Londoners were arrived at such a pitch of licentiousness, that their prosperity seemed a curse rather than a blessing. The sons of the most eminent and wealthy citizens entered into a confederacy to commit burglaries, and to rob

26  
Of the  
Londoners.

and murder all that came in their way in the night-time. The king took an opportunity from these irregularities to enrich himself. He demanded several loans and free gifts; till at last the Londoners, to prevent further inquiries into their conduct, paid into the exchequer 5000 l. in three years. These disorders, however, were at last stopped by the execution of John Senex; who, though a very rich and reputable citizen, had engaged in these enterprises. He offered 500 lb. weight of silver, a prodigious sum in those days, for his pardon, but was refused. The king, however, still continued to drain the citizens of their money by free gifts; and at last fined every separate guild, fraternity, or company, that had presumed to act as bodies corporate without the royal letters-patent.

On the death of Henry I. the title of the first magistrate of London was changed from *portreeve* to that of *baillif*; and in 1180 claimed and acted in the office of the *chief butler* at the coronation of Richard I. In 1191 this monarch permitted the baillif, named *Henry Fitz Alwine*, to assume the title of *mayor*. For, in 1192, we find certain orders of the mayor and aldermen to prevent fires; whereby it was ordained, that "all houses thereafter to be erected in London and the liberties thereof, should be built of stone, with party-walls of the same; and covered either with slates or tiles, to prevent those dreadful calamities by fire, which were frequently and chiefly occasioned by houses built of wood, and thatched with straw or reeds." And for this purpose it was also provided by the discreeter men of the city, "that 12 aldermen of the city should be chosen in full hufings, and there sworn to assist the mayor in appeasing contentions that might arise among neighbours in the city upon inclosure betwixt land and land, and to regulate the dimensions of party-walls, which were to be of stone, 16 feet high, and three feet thick; and to give directions about girders, windows, gutters, and wells." Such confidence also did Richard put in the wisdom and faithfulness of the city of London, that when it was resolved to fix a standard for weights and measures for the whole realm, his majesty committed the execution thereof to the sheriffs of London and Middlesex, whom he commanded to provide measures, gallons, iron rods, and weights for standards, to be sent to the several counties of England. This happened in 1198, at which time corn was advanced to the enormous price of 18. 4d. per quarter.

The city of London was much favoured by king John, who granted them three charters soon after his accession. The first was a recital and confirmation of those granted by Henry I. and II. with the farther privilege of being free from toll and every other duty or custom in his majesty's foreign dominions; for which they paid the sum of 3000 merks. The second was a confirmation of one granted by king Richard. By this the citizens of London had the jurisdiction and confederacy of the river Thames; with a clause to extend that jurisdiction, and the powers therewith granted, to the river Medway; and with another clause to enable the said city, as conservators of the rivers Thames and Medway, to inflict a penalty of 10 l. upon any person that should presume to erect a wear in either of these rivers. The third charter contains a fee-farm-rent of the sheriffwicks of London and Middlesex

**London.** Middlesex at the ancient rent, of which they had been deprived by queen Maud; granting them also the additional power of choosing their own sheriffs. This charter was given by way of conveyance from the crown to the citizens for a valuable consideration, by which the sheriffwick became their freehold; and this is the first covenant or conveyance we find on record with the legal terms of *to have and to hold*, which are at this time accounted an essential part in all conveyances of property.

**London** 19  
prefixed by  
Henry III. During the reign of Henry III. the city of London was oppressed in many different ways. In 1218, he exacted a fine of 40 marks for selling a sort of cloth not two yards within the lifts; and a 15th of the citizens personal estates for the enjoyment of their ancient rights and privileges. In 1221, he commanded by proclamation all the foreign merchants to depart the city; which drew 30 marks from the Anseatic company of the *Steelyard*, to have seisin of their guild or hall in Thames-street. But it was the wrestling-match at St Giles's in the fields that brought on their greatest burden. In the year 1221, on St James's day, the citizens of London having carried off the victory from the people of Westminster and other neighbouring villages, the steward of the abbot of Westminster, meditating revenge against the Londoners, proposed another wrestling match with them, and gave a ram for the prize. The citizens resorted to the place at the time appointed; but were unexpectedly assaulted by a great number of armed men, who killed and wounded many, and dispersed the rest. This raised a great commotion in the city. The populace breathed revenge; and, by the instigation of Constantine Fitz-Arnulph, a great favourite of the French party during the troubles in king John's reign, they proceeded to Westminster, and pulled down the houses both of the steward and abbot. Hearing afterwards that the abbot was come into the city with his complaint to Philip Daubney the king's counsel, they pursued him, beat his servants cruelly, took away 12 of his horses, and would have murdered himself, had he not escaped by a back-door. Upon this tumult, Hubert de Bury, then chief justiciary, summoned the mayor and many of the principal citizens to attend him in the tower of London; and inquiring for the authors of the riot, Constantine, the ringleader, boldly answered, that "he was one; that they had done no more than they ought; and that they were resolved to avow what they had done, let the consequence be what it would." In this he was seconded by his nephew and one Geoffrey; but the justiciary, having dismissed all the rest, detained these three, and ordered them to be hanged next morning, though Constantine offered 15,000 marks for his pardon. Hubert then coming into the city with a strong guard, caused the hands and feet of most of the principal rioters he could seize to be cut off; all which was executed without any legal proceedings or form of trial. After these arbitrary cruelties, he degraded the mayor and all the magistrates; placed a *custos* over the city, and obliged 30 persons of his own choosing to become securities for the good behaviour of the whole city. Several thousand marks were also exacted by the king, before he would consent to a reconciliation.

This arbitrary behaviour alarmed the whole nation.

**London.** The parliament of 1224 began to be uneasy for themselves, and addressed his majesty that he would be pleased to confirm the charter of liberties which he had sworn to observe; and the consequence of this application was a confirmation of the magna charta in the full parliament at Westminster in the year 1225. At this time also all the rights and privileges of the citizens were confirmed. They were exempted from prosecutions for burels, *i. e.* lifted-cloth; and were granted the right of having a common seal. The necessities circumstances of this monarchy, however, made him often exact money arbitrarily as long as he lived.

Under the succeeding reigns, as the liberty of the people in general was augmented, so the liberty, opulence, and power of the citizens of London increased, until they became a kind of balance to the power of the crown itself, which in some measure they still continue to be. Riots indeed, for which they generally suffered, were by no means unfrequent; the city often suffered by fires, and plagues. Nothing, however, happened which materially affected the welfare of the city, till the reign of Charles II. in 1665.—This year London was ravaged by the most violent plague ever known in Britain. Dreadful-  
The whole summer had been remarkably still and warm, so that the weather was sometimes suffocating even to people in perfect health; and by this unusual heat and sultry atmosphere, people were undoubtedly prepared for receiving the infection, which appeared with violence in the months of July, August, and September. A violent plague had raged in Holland in the year 1663; on which account the importation of merchandise from that country was prohibited by the British legislature in 1664. Notwithstanding this prohibition, however, it seems the plague had actually been imported; for in the close of the year 1664, two or three persons died suddenly in Westminster, with marks of the plague on their bodies. Some of their neighbours, terrified at the thoughts of their danger, removed into the city; but their removal proved too late for themselves, and fatal to those among whom they came to reside. They soon died of the plague; and communicated the infection to so many others, that it became impossible to extinguish the seeds of it by separating those that were infected from such as were not. It was confined, however, through a hard frosty winter, till the middle of February, when it again appeared in the parish of St Giles's, to which it had been originally brought; and after another long rest till April, shewed its malignant force afresh, as soon as the warmth of the spring gave it opportunity.—At first it took off one here and there, without any certain proof of their having infected each other, and houses began to be shut up, with a design to prevent its spreading. But it was now too late; the infection gained ground every day, and the shutting up of houses only made the diseases spread wider. People, afraid of being shut up, and sequestered from all communication with society, concealed their illness, or found means to escape from their places of confinement; while numbers expired in the greatest torments, destitute of every assistance; and many died both of the plague, and other diseases, who would in all probability have recovered, had they been allowed their liberty, with proper exercise and air.—A house was shut up on account of a maid-servant, who had only spots,

London.

spots, and not the gangrenous plague-blotches, upon her, so that her distemper was probably a petechial fever. She recovered; but the people of the house obtained no liberty to stir, either for air or exercise, for 40 days. The bad air, fear, anger, and vexation, attending this injurious treatment, cast the mistress of the family into a fever. The visitors appointed to search the houses, said it was the plague, though the physicians were of a different opinion: the family, however, were obliged to begin their quarantine anew, though it had been almost expired before; and this second confinement affected them so much, that most of the family fell sick, some of one distemper, and some of another. Every illness that appeared in the family produced a fresh prolongation of their confinement; till at last the plague was actually brought in by some of those who came to inquire into the health of the family, and almost every person in the house died.—Many examples of a similar kind happened, and this was one of the worst consequences of shutting up houses. All means of putting a stop to the infection were evidently ineffectual. Multitudes fled into the country; many merchants, owners of ships, &c. shut themselves up, on board their vessels, being supplied with provisions from Greenwich, Woolwich, and single farm-houses on the Kentish side. Here, however, they were safe; for the infection never reached below Deptford, though the people went frequently on shore to the country-towns, villages, and farm-houses, to buy fresh provisions. As the violence of the plague increased, the ships, which had families on board, removed farther off; some went quite out to sea, and then put into such harbours and roads as they could best get at.

In the mean time the distemper made the most rapid advances within the city. In the last week of July, the number of burials amounted to 2010; but the first week of August it rose to 3817; thence to 3880; then to 4237; the next week, to 6102; and at last to 7000 and 8000 weekly. In the last week of September, however, the fury of the disease began to abate; though vast numbers were sick, yet the number of burials decreased from 7155 to 5538; the next week there was a farther decrease to 4929, then to 4327, next to 2665, then to 1421, and the next week to 1031.

All this while, the poor people had been reduced to the greatest distresses, by reason of the stagnation of trade, and the sicknesses to which they were peculiarly liable on account of their manner of living. The rich, however, contributed to their subsistence in a most liberal manner. The sums collected on this occasion are, indeed, almost incredible; being said to amount to 100,000*l.* per week. The king is reported to have contributed 1000*l.* weekly; and in the parish of Cripplegate alone 17,000*l.* was distributed weekly among the poor inhabitants.—By the vigilance also of the magistrates, provisions continued remarkably cheap throughout the whole time of this dreadful calamity, so that all riots and tumults on that account were prevented; and at last, on the cessation of the disease in the winter of 1665, the inhabitants who had fled returned to their habitations, and London to appearance became as populous as ever, though it was computed that 100,000 persons had

been carried off by the plague.

The city was scarcely recovered from the desolation occasioned by the plague, when it was almost totally laid in ashes by a most dreadful fire. This broke out in a baker's shop in Pudding-lane, on Saturday-night, September 2. 1666. In a few hours Billingsgate ward was entirely burnt down; and before morning the fire had crossed Thames-Street, and destroyed the church of St Magnus. From thence it proceeded to the bridge, and consumed a great pile of buildings there; but was stopped by the want of any thing more to destroy. The flames, however, being scattered by a strong east wind, continued their devastation in other quarters. All efforts to stop it proved unsuccessful throughout the Sunday. That day it proceeded up as far as Garlick-hithe; and destroying Canon-street, invaded Cornhill and the exchange. On Monday, the flames having proceeded eastward against the wind through Thames-street, invaded Tower-street, Grace-church-street, Fenchurch-street, Dowgate, Old-fish-street, Watling-street, Thread-needle-street, and several others, from all which it broke at once into Cheapside. In a few hours Cheapside was all in flames, the fire having reached it from so many places at once. The fire then continuing its course from the river on one side, and from Cheapside on the other, surrounded the cathedral of St Paul's. This building stood by itself at some distance from any houses; yet such was the violence of the flames, and the heat of the atmosphere occasioned by them, that the cathedral took fire at top. The great beams and masonry stones broke through into Faith-church underneath, which was quickly set on fire; after which, the flames invaded Pater-noster-row, Newgate-street, the Old Bailey, Ludgate-hill, Fleet-street, Iron-monger-lane, Old-Jury, Laurence-lane, Milk-street, Wood-street, Gutter-lane, Foster-lane, Lothbury, Cateaton-street; and, having destroyed Christ-church, burnt furiously thro' St Martin's Le Grand towards Aldergate.

The fire had now attained its greatest extent, and was several miles in compass. The vast clouds of smoke obscured the sun so, that he either could not be seen at all, or appeared through it as red as blood. The flames reached an immense way up into the air, and their reflection from the smoke, which in the night-time seemed also like flame, made the appearance still more terrible. The atmosphere was illuminated to a great extent, and this illumination is said to have been visible as far as Jedburgh in Scotland. Some of the light ashes also are said to have been carried to the distance of 16 miles. Guildhall exhibited a singular appearance. The oak with which it was built was so solid that it would not flame, but burnt like charcoal, so that the building appeared for several hours like an enchanted palace of gold or burnished brass.

At last, on Wednesday morning, when every one expected that the suburbs as well as the city were to have been burnt, the fire began of itself to abate by reason of the wind having ceased, and some other changes no doubt taken place in the atmosphere. It was checked by the great building in Leaden-hall-street, and in other streets, by the blowing up several houses with gun-powder; and on Thursday the flames were quite extinguished.—The following is a calculation of the damage done by this extraordinary

London.

21  
Account of  
the great  
fire in 1666.

London.	L O N	[ 4277 ]	L O N	London.
22 Calculation of the dam- age done.	conflagration. Thirteen thousand two hundred houses, at 12 years purchase, sup- posing the rent of each 25 l. Ster- ling,	L. s. d.  3,960,000 0 0	to be powerfully supported by a French army. In consequence of this discovery, the Papists were banish- ed from the city and ten miles round, and five jesuits were hanged for the abovementioned plot.	24 Which gives occa- sion to a quarrel with the court.
	Eighty-seven parish-churches, at 8000 l.	696,000 0 0	The Papists thought to revenge themselves, by for- ging what was called the <i>meal-tub plot</i> , in which the Presbyterians were supposed to hatch treacherous de- signs against the life of the king. Sir Edmundbury Godfrey also, who had been very active in his pro- ceedings against the Papists, was murdered by some unknown persons; and this murder, together with their discovering the falsehood of the meal-tub plot, so exasperated the Londoners, that they resolved to shew their detestation of Popery by an extraordinary exhibition on the 17th of November, queen Eliza- beth's accession to the throne, on which day they had usually burnt the pope in effigy. The procession began with a person on horseback personating Sir Ed- mundbury Godfrey, attended by a bell-man proclaim- ing his execrable murder. He was followed by a per- son carrying a large silver-crofs, with priests in copes, Carmelites, and Gray-friars, followed by six jesuits: then proceeded divers waiters, and after them some bishops with lawn-sleeves, and others with copes and mitres. Six cardinals preceded the pope, enthroned in a stately pageant, attended by divers boys with pots of incense, and the devil whispering in his ear. In this order they marched from Bishopgate to Fleet-street; and there, amidst a great multitude of spectators, committed his holiness to the flames.	
	Three city-gates at 3000 l. each	9000 0 0	This procession gave great offence to the court, at which the duke of York, afterwards James II. had a great influence. The breach was farther widened by the choice of sheriffs for that year. The candidates set up by the court were rejected by a majority of al- most two to one; but this did not deter their party from demanding a poll in their behalf, upon which a tumult ensued. This was represented by the Popish party in such colours to the king, that he issued out a commission that same evening for trying the rioters; which, however, was so far from intimidating the re- st, that they grew more and more determined, not only to oppose the Popish party, but to exclude the duke of York from his succession to the crown.	
	Jail of Newgate	15,000 0 0	In the mean time, the king prorogued the parlia- ment, to prevent them from proceeding in their in- quiry concerning the Popish plot, and the exclusion- bill. Upon this the lord-mayor, aldermen, and com- mon-council, presented a petition to his majesty, in which they requested, that he would permit the parliament to sit in order to complete their salutary measures and councils. This petition was highly re- sented by the king; who, instead of granting it, dis- solved the parliament, and could never afterwards be reconciled to the city. From this time it was deter- mined to seize their charter; and fresh provocations having been given about the election of sheriffs, a <i>quo A</i> warranto was at last produced by the attorney-gene- ral, in order to overthrow their charter, and thereby to deprive the citizens of the power to choose sheriffs against the city.	
	Four stone-bridges	6000 0 0	This information set forth, That "the mayor and commonalty and citizens of the city of London, by the space of a month then last past and more, used, and yet do claim to have and use, without any lawful warrant or regal grant, within the city of London afore- said,	
	Sessions-house	7000 0 0		
	Guildhall, with the courts and offices belonging to it	40,000 0 0		
	Blackwell-hall	3000 0 0

	Woodstreet Compter	3000 0 0		
	St Paul's church	2,000,000 0 0		
	Wares, household-stuff, money, and moveable goods lost or spoiled	2,000,000 0 0		
	Hire of porters, carts, wag- gons, barges, boats, &c. for re- moving goods	200,000 0 0		
	Printed books and paper in shops and warehouses	150,000 0 0		
	Wine, tobacco, figar, &c. of which the town was at that time very full	1,500,000 0 0		
		10,689,000 0 0		

It was never certainly known whether this fire was accidental or designed. A suspicion fell upon the Pa-  
pists; and this gained such general credit, that it is as-  
serted for a truth on the monument which is erected in  
memory of the conflagration. Of the truth of this as-  
sertion, however, though there was not sufficient proof,  
it had the effect of making the Papists most violent-  
ly suspected and abhorred by the Protestants, which  
some time after proved very prejudicial to the city it-  
self.

From this calamity, great as it was, London soon  
recovered itself, and became much more magnificent  
than before; the streets, which were formerly crooked  
and narrow, being now built wide and spacious; and  
the industry of its inhabitants repaired the losses they  
had sustained. In 1679, the city was again alarmed  
by the discovery of a design to destroy it by fire a se-  
cond time. Elizabeth Oxley, servant to one Rind in  
Fetter-lane, having let her master's house on fire, was  
apprehended on suspicion, and confessed, that she had  
been hired to do it by one Stubbs a Papist, for a re-  
ward of 5 l. Stubbs being taken into custody, ac-  
knowledgeed that he had persuaded her to it; and  
that he himself had been prevailed upon by one Fitz-  
Gifford his confessor, who had assured him, that by  
burning the houses of heretics he would do a great ser-  
vice to the church. He also owned that he had several  
conferences with Gifford and two Irishmen on the  
affair. The maid and Stubbs also agreed in declaring,  
that the Papists intended to rise in London, expecting

23  
A religion  
to set it  
on fire  
again.

25  
quo A  
warranto  
granted  
against the  
city.

London. said, and the liberties and privileges of the same city, the liberties and privileges following, viz.

" 1. To be of themselves a body corporate and politic, by the name of *mayor and commonalty and citizens of the city of London*.

" 2. To have sheriffs *civitat. et coram London. & com. Middlesex*, and to name, make, elect, and constitute them.

" 3. That the mayor and aldermen of the said city should be justices of the peace, and hold sessions of the peace.

All which liberties, privileges, and franchises, the said mayor and commonalty, and citizens of London, upon the king did by the space aforesaid usurp, and yet do usurp."

Though nothing could be more unjust than this prosecution, the minority were determined at all events to crush the Londoners; rightly judging, that it would be an easy matter to make all other corporations surrender their charters into the king's hands, and that they had no other body in the nation to fear. Accordingly they displaced such judges as would not approve of their proceedings; and, on the 12th of June 1683, Justice Jones pronounced the following sentence: "That a city might forfeit its charter; that the malversations of the common-council were acts of the whole city; and that the points set forth in the pleadings were just grounds for the forfeiting of a charter."

Notwithstanding this sentence, however, the attorney-general, contrary to the usual custom in such cases, was directed to move that the judgment might not be recorded; being afraid of the consequences. Yet it was judged that the king might seize the liberties of the city. A common-council was immediately summoned to deliberate on this exigency. The country party moved to have the judgment entered; but they were over-ruled by the court-party, who insisted upon an absolute submission to the king before judgment was entered: and though this was in effect a voluntary surrender of the city-liberties, and depriving themselves of the means of getting the judgment reversed, the act of submission was carried by a great majority: and in a petition from the lord-mayor, aldermen, and common-council, they "acknowledged their own misgovernment, and his majesty's lenity; begged his pardon, and promised constant loyalty and obedience; and humbly begged his majesty's commands and directions." To this his majesty answered, that he would not reject their suit, if they would agree upon the following particulars.

1. That no lord-mayor, sheriff, recorder, common sergeant, town-clerk, or coroner, of the city of London, or steward of the borough of Southwark, shall be capable of, or admitted to, the exercise of their respective offices before his majesty shall have approved of them under his sign manual.

2. That if his majesty shall disapprove the choice of any person to be lord mayor, and signify the same under his sign manual to the lord mayor, or, in default of a lord mayor, to the recorder or senior alderman, the citizens shall, within one week, proceed to a new choice: and if his majesty shall in like manner disapprove the second choice, his majesty may, if he please, nominate a person to be lord-mayor for the

year ensuing.

3. If his majesty shall, in like manner, disapprove the persons chosen to be sheriffs, or either of them, his majesty may appoint sheriffs for the year ensuing.

4. That the lord-mayor and court of aldermen may, with the leave of his majesty, displace any alderman, recorder, &c.

5. Upon the election of an alderman, if the court of aldermen shall judge and declare the person present to be unfit, the ward shall choose again; and upon a disapproval of a second choice, the court may appoint another in his room.

6. That the justices of the peace should be by the king's commission; and the settling of those matters to be left to his majesty's attorney-general, and council learned in the law.

To these the lord keeper added in the king's name, "That these regulations being made, his majesty would not only pardon this prosecution, but would confirm their charter in such a manner as should be consistent with them;" concluding thus: "My lord mayor, the term draws towards an end, and midsummer-day is at hand, when some of the officers used to be chosen; whereof his majesty will reserve the approbation. Therefore, it is his majesty's pleasure, that you return to the city, and consult the common-council, that he may speedily know your resolutions thereupon, and accordingly give his directions. That you may see the king is in earnest, and the matter is not capable of delay, I am commanded to let you know he hath given orders to his attorney-general to enter upon judgment on Saturday next; unless you prevent it by your compliance in all these particulars."

A common-council was summoned, when the friends of liberty treated those slavish conditions as they deserved; and even declared, that they were ready to sacrifice all that was near or dear to them, rather than submit to such arbitrary impositions: but when it was put to the vote, there appeared a majority of 18 for submission.

Thus the king got the government of the city into his own hands, though he and his brother entirely lost the affections of the Londoners. But, not content with their submission, his majesty departed from his promise; commanded the judgment upon the *quo warranto* to be entered; and commissioned Sir William Pritchard, the lord mayor, to hold the same office during his majesty's pleasure. In the same manner he appointed or displaced the other magistrates as he thought proper; after which the minority, having nothing to fear, proceeded in the most arbitrary manner.

In this subjection to the will of the court, the city of London continued till the revolution: but, in 1689, the immediate restoration of the Londoners to their franchises was ordered; and in such a manner and form, as to put it out of the powers of an arbitrary ministry and a corrupt judge and jury to deprive them of their chartered liberties for the time to come. Accordingly a bill was brought into parliament, and passed, for reversing the judgment of the *quo warranto* against the city of London, and for restoring the same to its ancient rights and privileges. Since that time the city of London hath enjoyed tranquillity; its commerce hath been carried to the highest pitch; and for the politeness, riches,

London.

London. riches, and number of its inhabitants, as well as its extent and the magnificence of its buildings, is inferior to no city in Europe.

28  
Description  
of the city. London stands on a spot where the Thames is formed into a half-moon, and at the distance of 60 miles by water from the mouth of the river, but where the flux and reflux of the tide is very perceptible. But the part particularly distinguished by the name of the *city of London*, stands on the north shore from the Tower to the Temple, and is covered from the cold north winds by the hills of Hampstead and Highgate. In its present extent, it has included one city, one borough, and 49 villages. For within it we find the city of Westminster, the borough of South-wark and the villages of Mora, Finsbury, Wenlexbarn, Clerkenwell, Islington, Hoxton, Shoreditch, Norton-falgate, the Spital, Whitechapel, Mile-end new town, Mile-end old town, Bethnal Green, Stepney, Bow, Bromley, Blackwall, Poplar, Limehouse, Ratcliff, Shadwell, Wapping-Stepney, Wapping, East-Smithfield, Hermitage, St Catherine's, the Minories, St Clement's Danes, the Strand, Charing-croft, St James's, Knightbridge, Marybone, Soho, St Giles's in the fields, St Martins in the fields, Bloomsbury, Port-pool, Saffron-hill, Holborn. And on the south-side of the Thames are Vauxhall, Lambeth, Lambeth-marsh, Kennington, Newington-Butts, Bermondsey, the Grange, Horsley Down, and Rotherhithe; beyond which, a very little to the eastward, stand the two villages of Deptford and Greenwich, the former of which contains between 1800 and 1900 houses, and the latter between 1300 and 1400, each of them excelling the capitals of three or four foreign princes put together, both in number of houses, inhabitants, and riches. The length of the ground on which all these buildings stand is seven miles and a half and 176 yards, its breadth three miles 170 yards and an half.

By the *city of London*, we are to understand no more than that part formerly encompassed by the wall, which in circumference measures only three miles and 165 feet. In this wall there were eight gates: but the wall hath long since been pulled down to make way for new buildings in several places; and there is now left standing only one of the city-gates called *New-gate*, the others being removed to widen the streets, and to make the avenues to the city more commodious and airy. The liberties, or those parts of this great city which are subject to its jurisdiction, and lie without the walls of London, are bounded on the east, in White-chapel, the Minories, and Bishopsgate, by bars, which were formerly polls and chains, that were frequently taken away by arbitrary power, when it was thought proper to seize the franchises of the city of London: on the north, they are bounded in the same manner in Pick-ax street, at the end of Fan-alley, and in St John's street: on the west, by bars in Holborn: at the east end of Middle Row, and at the west end of Fleet-street, by the gate called *Temple-bar*: on the south, we may include the jurisdiction which the city holds on the river Thames, and over the borough of Southwark, to which the city of London has an undoubted right by charter, and for which they paid a valuable consideration to king Edward VI. and which was confirmed to them by the 2d of William & Mary, c. 8.—The city is at present divided into 26 wards.

VOL. VI.

1. *Aldersgate ward* takes its name from a city-gate London. which lately stood in the neighbourhood. It is bounded on the east by Cripplegate ward; on the west, by Farringdon ward within and without; and on the south, by Farringdon ward within. It is very large, and is divided into Aldersgate-within and Aldersgate-without. Each of these divisions consists of four precincts, under one alderman, eight common-council men, of whom two are the alderman's deputies, eight constables, fourteen inquest-men, eight scavengers, and a beadle; exclusive of the officers belonging to the liberty of St Martin's le Grand, which contains 168 houses.

2. *Aldgate* takes its name also from a gate, which was of great antiquity, being mentioned in king Edgar's charter to the knights of the Knighton guild about the year 967; and was probably of a much more ancient foundation, for it was the gate through which the Roman Vicinal way lay to the ferry at Oldford. It was pulled down some years ago by parliamentary authority, at the petition of the corporation.—The ward of Aldgate is bounded on the east by the city-wall, which divides it from Portoken-ward; on the north, by Bishopsgate ward; on the west, by Lime-street and Langbourn wards; and on the south, by Tower-street ward. It is governed by an alderman, six common-council men, six constables, twenty inquest-men, seven scavengers, and a beadle; besides the officers belonging to St James's, Duke's Place.—It is divided into seven precincts.

3. *Basilhaw or Basinghall ward*, is bounded on the east and south by Coleman-street ward, on the north by part of Cripplegate, and on the west by part of the wards of Cheap and Cripplegate. On the south, it begins at Blackwell-hall; and runs northward to London-wall, pulled down some time ago to make way for new buildings in *Fore-street*, and spreads 88 feet east, and 54 feet west against the place where that wall stood. This is a very small ward, and consists only of two precincts: the upper precinct contains no more than 66, and the lower only 76 houses. It is governed by an alderman, four common-council men, of whom one is the alderman's deputy, three constables, seventeen inquest-men, three scavengers, and a beadle. It has its name from Basinghall the mansion-house of the family of *Basing*, which was the principal house in it, and stood in the place of Blackwell-hall.

4. *Billinggate ward* is bounded on the east by Tower-street ward; on the north, by Langbourn ward; on the west, by the ward of Bridge-within; and on the south, by the river Thames. It is divided into 12 precincts; and is governed by an alderman, 10 common-councilmen, one of whom is the alderman's deputy, 11 constables, 14 inquest-men, six scavengers, and a beadle. The origin of its name is unknown. Its situation on the river gives it great advantages with respect to trade and merchandize; so that it is well inhabited, and is in a continual hurry of business at the several wharfs or quays.

5. *Bishopsgate ward* is bounded on the east by Aldgate ward, Portoken ward, and part of the Tower-liberty, or Norton-falgate; on the west, by Broad-street ward and Moorfields; and on the south, by Langbourn ward. It is very large, and divided into Bishopsgate-

24 H

within,

*London*, within, and Bishoptgate-without. The first contains all that part of the ward within the city-wall and gate, and is divided into five precincts; the second lies without the wall, and is divided into four precincts. This ward is governed by an alderman, two deputies, one within and the other without, 12 common-council men, seven constables, 13 inquest-men, nine scavengers, and two beadle. It took its name from the gate, which has been pulled down to make that part of the city more airy and commodious.

6. *Bread-street ward* is encompassed on the north and north-west, by the ward of Farringdon-within; on the east, by Cordwainer's ward; on the south by Queen-hith ward; and on the west, by Castle-Baynard ward. It is divided into 13 precincts; and is governed by an alderman, 12 common-council men, of whom one is the alderman's deputy, 13 constables, 13 inquest-men, 13 scavengers, and a beadle; and yet contains no more than 331 houses. It takes its name from the ancient bread-market, which was kept in the place now called *Bread-street*; the bakers being obliged to sell their bread only in the open market, and not in shops.

7. *Bridge-ward within* is bounded on the south by the river Thames and Southwark; on the north, by Langbourn and Bishoptgate ward; on the east, by Billingsgate; and on the west, by Candlewick and Dowgate wards. It is divided into 14 precincts, three of which were on London-bridge; and is governed by an alderman, 15 common-council men, one of whom is the alderman's deputy, 14 constables, 15 inquest-men, 14 scavengers, and a beadle. It takes its name from its connection with London-bridge.

8. *Broad-street ward* is bounded on the north and east, by Bishoptgate ward; on the south, by Cornhill and Wallbrook ward; and on the west by Coleman-street ward. It is divided into 10 precincts; and governed by an alderman, 10 common-council men, one of whom is the alderman's deputy, 10 constables, 13 inquest-men, eight scavengers, and a beadle. It has its name from that part of it now distinguished by the name of *Old Broad-street*; and which, before the fire of 1666, was accounted one of the broadest streets in London.

9. *Candlewick-ward, Candlewick-street, or Candle-wright-street ward*, as it is called in some ancient records, is bounded on the east by Bridge ward; on the south, by Dowgate, and part of Bridge ward; on the west, by Dowgate and Wallbrook; and on the north, by Langbourn ward. It is but a small ward, consisting of about 286 houses; yet is divided into seven precincts. It is governed by an alderman, eight common-council men, of whom one is the alderman's deputy, seven constables, 13 inquest-men, seven scavengers, and a beadle. It has its name from a street formerly inhabited chiefly by candle-wrights or candle-makers, both in tallow and wax; a very profitable business in the times of Popery, when incredible quantities of wax-candles were consumed in the churches. That street, however, or at least its name, *Candlewick*, is lost since the great conflagration, for which the name *Canon-street* is substituted, the candle-wrights being at that time burnt out and dispersed through the city.

10. *Castle-Baynard ward* is bounded by Queen-

hith and Bread-street wards on the east; on the south, by the Thames; and on the west and north, by the ward of Farringdon-within. It is divided into 10 precincts, under the government of an alderman, 10 common-council men, one of whom is the alderman's deputy, nine constables, 14 inquest-men, seven scavengers, and a beadle. It takes its name from a castle built on the bank of the river by one Baynard, a soldier of fortune, who came in with William the Conqueror, and was by that monarch raised to great honours and authority.

11. *Cheap-ward* is bounded on the east by Broad-street and Wallbrook wards; on the north, by Coleman-street, Bassishaw, and Cripple-gate; and on the south, by Cordwainer's ward. It is divided into nine precincts; and is governed by an alderman, 12 common-council men, of whom one is the alderman's deputy, 11 constables, 13 inquest-men, nine scavengers, and a beadle. It has its name from the Saxon word *chepe*, which signifies a market, kept in this division of the city, now called *Cheapside*; but then known by the name of *Westcheap*, to distinguish it from the market then also kept in Eastcheap, between Canon or Candlewick street and Tower-street.

12. *Coleman street ward* is bounded on the east by Bishoptgate, Broadstreet, and Cheap wards; on the north, by Cripple-gate ward, Middle Moorfields, and Bishoptgate; on the south, by Cheap ward; and on the west, by Bassishaw ward. It is divided into six precincts; and is governed by an alderman, six common-council men, one of whom is the alderman's deputy, six constables, 13 inquest-men, six scavengers, and a beadle. The origin of the name is not certainly known.

13. *Cordwainer's ward* is bounded on the east by Wallbrook, on the south by Vintry ward, on the west by Bread-street, and on the north by Cheap ward. It is divided into eight precincts; and is governed by an alderman, eight common-council men, one of whom is the alderman's deputy, eight constables, 14 inquest men, eight scavengers, and a beadle. Its proper name is *Cordwainers-street-ward*; which it has from Cordwainers-street, now Bow-lane, formerly occupied chiefly by shoemakers and others that dealt or worked in leather.

14. *Cornhill ward* is but of small extent. It is bounded on the east by Bishoptgate, on the north by Broadstreet, on the west by Cheap ward, and on the south by Langbourn ward. It is divided into four precincts, which are governed by one alderman, six common-council men, of whom one is the alderman's deputy, four constables, 16 inquest-men, four scavengers, and a beadle. It takes its name from the principal street in it, known from the earliest ages by the name of *Cornhill*, because the corn-market was kept there.

15. *Cripple-gate ward* is bounded on the east by Moorfields, Coleman-street ward, Bassishaw ward, and Cheap-ward; on the north, by the parish of St Luke's, Old-street; on the west, by Aldersgate ward; and on the south, by Cheap ward. It is divided into 13 precincts, nine within and four without the wall; and is governed by an alderman, 12 common-council men, of whom two are the alderman's deputies, 13 constables, 34 inquest-men, 16 scavengers, and three beades. It takes

London. takes its name from *Cripplegate*, which stood on the north-west part of the city wall. It was an old plain structure, void of all ornament, with one postern; but had more the appearance of a fortification than any of the other gates. It was removed in order to widen the entrance into Wood-street, which, by the narrowness of the gateway was too much contracted and rendered dangerous for passengers and great wag-gons.

16. *Dowgate ward* is bounded on the east by Candle-wick and Bridge wards, on the north by Wallbrook ward, on the west by Vintry ward, and on the south by the Thames. It is divided into eight precincts, under the government of an alderman, eight common-council men, of whom one is the alderman's deputy, eight constables, 15 inquest-men, five scavengers, and a beadle. It has its name from the ancient water-gate, called *Durgate*, which was made in the original wall that ran along the north-side of the Thames, for the security of the city against all attempts to invade it by water.

17. *Farringdon ward within* is bounded on the east by Cheap ward and Baynard-castle ward; on the north, by Aldergate and Cripplegate wards, and the liberty of St Martin's le Grand; on the west, by Farringdon-without; and on the south, by Baynard-castle ward, and the river Thames. It is divided into 18 precincts; and governed by one alderman, 17 common-council men, of whom one is the alderman's deputy, 19 constables, 17 inquest-men, 19 scavengers, and two beades. It takes its name from William Farringdon citizen and goldsmith of London, who, in 1279, purchased all the aldermanry with the appurtenances, within the city of London and suburbs of the same, between Ludgate and Newgate, and also *without* these gates.

18. *Farringdon ward without* is bounded on the east by *Farringdon-within*, the precinct of the late priory of St Bartholomew near Smithfield, and the ward of Aldergate; on the north, by the charter-house, the parish of St John's Clerkenwell, and part of St Andrew's parish without the freedom; on the west, by High Holborn, and St Clement's parish in the Strand; and on the south, by the river Thames. It is governed by one alderman, 16 common-council-men, of whom two are the alderman's deputies, 23 constables, 48 inquest-men; 24 scavengers; and four beades. It takes its name from the same goldsmith who gave name to *Farringdon-within*.

19. *Langborn ward* is bounded on the east by Ald-gate ward; on the north, by part of the same, and Lime-freet ward; on the south, by Tower-street, Bill-ingsgate, Bridge, and Candlewick wards; and on the west by Wall-brook. It is divided into 12 precincts. It had its name from a rivulet or long bourn of fresh-water, which anciently flowed from a spring near Mag-pye alley adjoining to St Catherine Coleman's church.

20. *Limefreet ward* is bounded on the east and north by Aldgate ward, on the west by Bishopsgate; and on the south by Langbourn ward. It is divided into four precincts; and governed by an alderman, four common-councilmen, one of whom is the alderman's deputy, four constables, 13 inquest men, four scavengers, and a beadle. It is very small; and has its name from some lime-kilns that were formerly built in or

near Lime-street.

21. *Portfoken ward* is bounded on the east by the parishes of Spitalfields, Stepney, and St George's in the east; on the south, by Tower hill; on the north, by Bishopsgate ward, and on the west by Aldgate ward. It is divided into five precincts; and is governed by an alderman, five common-council men, one of whom is the alderman's deputy, five constables, 19 inquest-men, five scavengers, and a beadle. Its name signifies the *franchise of the liberty-gate*. This Portoken was for some time a guild; and had its beginning in king Edgar, when 13 knights, "well-beloved of the king and realm, for services by them done," requested to have a certain portion of land on the east part of the city, left desolate and forsaken of the inhabitants by reason of too much servitude. They besought the king to have this land, with the liberty of a guild for ever. The king granted their request on the following conditions, viz. that each of them should victoriously accomplish three combats, one above the ground, one under ground, and the third in the water; and after this, at a certain day, in East Smithfield, they should run with spears against all comers. All this was gloriously performed; upon which the king named it *Knights Guild*, and extended it from Aldgate to the places where the bars now are on the east, and to the Thames on the south, and as far into the water as an horseman could ride at low water and throw his spear.

22. *Queen-hithe ward* is bounded on the east by Dowgate, on the north by Bread-street and Cord-wainer's wards, on the south by the Thames, and on the west by Castle-Baynard ward. It is divided into nine precincts; and is governed by one alderman, six common-councilmen, one of whom is the alderman's deputy, and nine constables. It has its name from the *hithe*, or harbour for large boats, barges, and lighters; for which, and even for ships, it was the anchoring place, and the key for lading and unloading vessels almost of any burden used in ancient times. It has the name of *queen*, because the queens of England usually possessed the tolls and customs of vessels that unloaded goods at this *hithe*, which were very considerable.

23. *Tower ward, or Tower-street ward*, is bounded on the south by the river Thames, on the east by Tower-hill and Aldgate ward, on the north by Lang-bourn ward, and on the west by Billingsgate ward. It is governed by one alderman, 12 common-council men, of whom one is the alderman's deputy, 12 constables, 13 inquest-men, 12 scavengers, and one beadle. It takes its name from *Tower-street*, so called because it leads out of the city in a direct line to the principal entrance of the Tower of London.

24. *Vintry ward* is bounded on the east by Dow-gate, on the south by the Thames, on the west by Queen-hithe ward, and on the north by Cordwainers ward. It is a small ward, containing only 418 houses; but is divided into nine precincts, and governed by an alderman, nine common-council men, one of whom is the alderman's deputy, nine constables, 13 inquest-men, three scavengers, and a beadle. It takes its name from the vintners or wine-merchants of Bour-deaux, who formerly dwelt in this part of the city, were obliged to land their wines on this spot, and to sell them in 40 days, till the 28th of Ed-ward I.

London.

London.

25. *Wallbrook ward* is bounded on the east by Langbourn, on the south by Dowgate ward, on the west by Cordwainers ward, and on the north by Cheap ward. It is small, containing only 306 houses; but is divided into seven precincts, and governed by an alderman, eight common-council men, of whom one is the alderman's deputy, seven constables, 13 inquest-men, six scavengers, and a beadle. It has its name from the rivulet *Wallbrook*, that ran down the street of this name into the river Thames near Dowgate; but in process of time it was so lost by covering it with bridges, and buildings upon those bridges, that its channel became a common sewer.

26. The ward of *Bridge without* includes the borough of Southwark, and the parishes of Rotherhithe, Newington, and Lambeth. It has its name from London-bridge, with the addition of the word *without*, because the bridge must be passed in order to come at it. This borough was incorporated in 1327. At this time, the citizens finding themselves greatly infested by felons, thieves, and disturbers of the peace, who escaped to and took shelter in Southwark, petitioned king Edward III. and his parliament for a grant of jurisdiction over the said village of Southwark: and their petition appeared so just, that his majesty, with consent of his parliament, granted to the said citizens, for himself and his heirs, the said village of Southwark, with the appurtenances, to have and to hold, to them and their heirs and successors, citizens of the said city, of the crown for ever, paying at the exchequer the farms due and accustomed. This ward is governed in a manner similar to the others. However, the magistracy of London seem to have adopted this ward only as a *finis* for the senior alderman for the time being; and thus neglecting the interests of Southwark, the justices of the county of Surry at last encroached so far upon the rights of the city of London as to contend with the citizens concerning their jurisdiction within the borough.

29  
Public  
buildings.

Of the many public buildings worthy of notice about London, the following are selected as the most remarkable.

1. *The Tower*. This building was at first designed as a fortress, and most probably erected in the time of the Romans. It was enlarged and strengthened by William the Conqueror, who garrisoned it with some of his best Norman troops, in order to keep the city in awe. In 1079, he built an addition to it, called the *White Tower*, on account of the colour of the stones with which it was constructed: and this being much damaged by an hurricane in 1093, repairs became necessary; at which time a new foundation was laid for a castle under the south side of the white tower, which was castellated round at a great expence, but not finished till the reign of Henry I. It is indeed perhaps the best chosen situation for a fortress of any in the world. It lies to the eastward of the city, but sufficiently near to preserve it from any invasion by water; being only 800 yards from the bridge; and to the north of the river Thames, from which it is parted by a narrow ditch and a convenient wharf. With the latter it communicates by a draw-bridge, for the readier issuing and receiving ammunition and military stores. On this wharf there is a long and beautiful platform, on which are planted 61 pieces of cannon, mounted on new and very elegant iron-carriages. They are chiefly used on

London.

days of state and for proclaiming any good news to the public. Parallel to the wharf, within the walls, is a platform 70 yards in length, called the *Ladies Line*, because much frequented by the ladies in the summer; it being shaded in the inside with a row of lofty trees, and without it is a delightful prospect of the shipping with boats passing and repassing on the river Thames. You ascend this line by stone steps, and being once upon it you may walk almost round the walls of the tower without interruption.

The principal entrance into the tower is by a gate to the west, large enough to admit coaches and heavy carriages; but these are first admitted through an outward gate, situated without the ditch upon the hill, and must pass a stout stone bridge built over the ditch before they can approach the main entrance. There is, besides, an entrance near the very south-west corner of the Tower outward wall, for persons on foot, over the draw-bridge already mentioned, to the wharf. There is also a water-gate, commonly called *Traitor's gate*, through which it has been customary to convey traitors and other false-prisoners to or from the Tower, and which is seldom opened on any other occasion; but the lords committed to the Tower in 1746 were publicly admitted at the main entrance. Over this gate is a regular building, terminated at each end by two round towers, on which are embrasures for pointing cannon. In this building there are the infirmary, the mill, and the water-works that supply the tower with water.

The white tower is a large square irregular building, situated almost in the centre, no one side answering to another; nor are any of its watch-towers, of which there are four that ornament the top, built alike: one of these towers is now converted into an observatory, and seems very well situated for the purpose. The building itself consists of three very lofty stories; under which are most spacious and commodious vaults, chiefly filled with salt-petre. It is covered at top with flat leads, from whence there is an extensive and delightful prospect. For a more particular description of the tower and the curiosities contained in it, see the article *TOWER of London*.

2. *The Royal Exchange* was founded in the year 1566. Sir Thomas Gresham, merchant in London, made an offer to the lord mayor and citizens, to build at his own expence, a commodious edifice for merchants to meet and transact business, provided the city would find him a convenient situation for the same. The citizens accordingly purchased, for the sum of 3532l. 8s houses in the two alleys called *New St Christophers*, and *Swan-alley*, leading out of Cornhill into Threadneedle street. The materials of those houses were sold for 478l. and the ground, when cleared, was conveyed to Sir Thomas Gresham, who, accompanied by several aldermen, laid the first brick of the new building on the 7th of June that year. Each alderman also laid his brick, and left a piece of gold for the workmen; who set about it with such assiduity and resolution, that the whole fabric was roofed by the month of November 1567, and was soon after completed under the name of the *Burfe*. Sir Thomas, by his will dated the 26th of November 1579, devised this stately fabric to the mayor and citizens of London and the company of mercers, to be equally enjoyed and possessed by them, with all its appurtenances and the profits arising there-  
by,

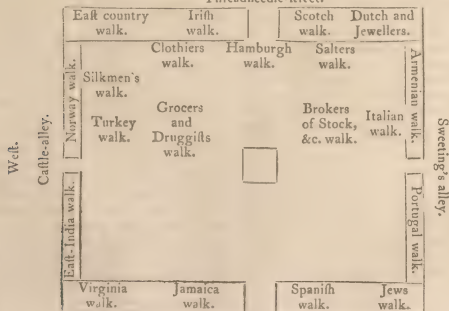

London. by, on condition that the citizens out of their moiety should pay a salary of 50*l.* per annum each to four lecturers, to read lectures in divinity, astronomy, music, and geometry, in his mansion-house, *vis.* Gresham-college: and to pay 6*l.* 13*s.* 4*d.* per annum each, to eight alms-people, situate behind the said college, in Broadstreet; and 10*l.* yearly to each of the prisoners of Newgate, Ludgate, King's-bench, Marshalsea, and Woodstreet Compter: And that the merchants out of their moiety should pay 50*l.* each per annum, to three lecturers to read lectures in law, physic, and rhetoric, in his mansion-house; and 100*l.* per annum for four quarterly dinners at their own hall, for the entertainment of the whole company; and 10*l.* yearly to Christ's, St Bartholomew's, Bethlehem, and St Thomas's hospitals. The same sum was also to be paid annually to the Spital, and to the Poultry Compter. This building was totally destroyed by the fire in 1666; and in its place the present magnificent structure was erected at the expence of 80,000*l.* which stands upon a plat of ground 203 feet in length and 171 in breadth, containing an area in the middle, of 61 square perches, surrounded with a substantial and regular stone building, wrought in rustic. It has two fronts, north and south, each of which is a piazza; and in the centre are the grand entrances into the area, under a very lofty and noble arch. The south front in Cornhill is the principal; on each side of which are Corinthian demi-columns, supporting a compass pediment; and, in the intercolumniation on each side, in the front next the street, is a niche, with the statues of king Charles I. and II. in Roman habits, and well executed. Over the aperture, on the cornice between the two pediments, are the king's arms in relief: on each side of this entrance is a range of windows placed between demi-columns, and pilasters of the composite order, above which runs a balustrade. This building is 56 feet high: and from the centre, in this front, rises a lantern and turret 178 feet high, on the top of which is a fan of gilt brass made in the shape of a grasshopper, the crest of Sir Thomas Gresham's arms. The north front in Threadneedle-street is adorned with pilasters of the com-

posite order; but has neither columns nor statues on the outside; and has a triangular, instead of compass, pediments. The inside of the area is also surrounded with piazzas, forming ambulatories for merchants, &c. to shelter themselves from the weather, when met there upon business. Above the arches of this piazza is an entablature with curious ornaments; and on the cornice a range of pilasters with an entablature extending round, and a compass pediment in the middle of the cornice of each of the four sides. Under the pediment on the north side are the king's arms; on the south, the city's arms; on the east, Sir Thomas Gresham's arms; and on the west, the mercer's arms, with their respective enrichments. In these intercolumns are 24 niches, 20 of which are filled with the statues of the kings and queens of England. Under these piazzas, within the area, are 28 niches, all vacant but that in which Sir Thomas Gresham's statue is placed in the north-west angle, and that in the south-west, where the statue of Sir John Barnard was placed in his lifetime by his fellow-citizens to express their sense of his merit. The centre of this area also is ornamented with a statue of king Charles II. in a Roman habit, standing upon a marble pedestal about eight feet high, and encompassed with iron rails; which pedestal is enriched on the south side with an imperial crown, a sceptre, sword, palm-branches, and other decorations, with a very flattering inscription to the king. On the west side is a cupid cut in relief, resting his right hand on a shield with the arms of France and England quartered, and holding a rose in his left hand. On the north side is another cupid supporting a shield with the arms of Ireland; and on the east-side are the arms of Scotland, with a cupid holding a thistle; all done in relief: the whole executed by that able statuary Mr Gibbon.

In this area, merchants, and such as have business with them, meet every day between twelve at noon and three in the afternoon: and for the more regular and readier dispatch of business, they dispose of themselves into separate walks, according to the following plan.

North.

Threadneedle-street.

Cornhill.

South.

In

London.

In building this expensive structure there was an eye not only to magnificence, and to accommodate the merchants, but also to reimburse the expence. For this reason a gallery was built over the four sides of the royal exchange. This was divided into 200 shops, which were let out to haberdashers, milliners, &c. and which for several years were well occupied. But these shops have now for a long time been deserted, and the galleries are let out to the Royal Exchange assurance office, the merchant-seamens office, the Marine society, and to auctioneers, &c. Under the whole area there are the finest dry vaults that can be found any where, which are let out to the East India company to deposit their pepper. In the turret is a good clock with four dials, which is well regulated every day, so that it becomes a standard of time to all the mercantile part of the town; and it goes with chimes at three, six, nine, and twelve o'clock, playing upon twelve bells. The outside of this grand fabric suffers very much in its elegance from the shops that surround it, and are built within its walls; and which are occupied by bookfellers, toymen, cutlers, hosiery, watch-makers, &c.

3. *St Paul's cathedral* is said by some to have been founded on that very spot where formerly stood a temple dedicated to the heathen goddess Diana. This, however, is refuted by Mr Entick, "Because (says he) there must have been found ox-skulls, horns of flags, and tusks of bears, used in sacrifices to that goddess, in the earth about her temple. But Sir Christopher Wren, who had more opportunity than any other person to discover the bowels of the earth, in digging the foundation of St Paul's as it now stands, declares that he found no indications to support such a tradition: but adds, that it was manifest the north side of this ground had been anciently a great burying-place; because he found, under the graves of the latter ages, in a row below them, the burial-places of the Saxon people, who were accustomed to line their graves with chalk-stones, or to be buried in coffins hewn out of the solid stone: and, in a row below the Saxons, he met with British graves. In these last were found ivory and wooden pins, the latter made of box or other hard wood, about six inches long, and in great numbers, which were used to pin up the corpse in a woollen shroud. And in the same row, but deeper, were Roman urns intermixed: this burial-place was upwards of 18 feet deep, and belonged to the colony of London, when the Romans and Britons lived together. The surveyor's curiosity led him deeper; and upon searching for the natural ground below these graves, he discovered that the foundation of the old church stood upon a layer of very close and hard pot-earth. Then he dug wells in different places; and found that this pot-earth on the north-side of the church-yard was about six feet thick or more, but thinner and thinner towards the south, till it decreased to scarce four feet at the declining of the hill, under which he found nothing but dry sand, mixed sometimes unequally, but loose, so that it would run through the fingers. Thence he dug down to the level of low-water-mark; where he met with water and sand, mixed with periwinkles and other sea-shells. He continued boring, till he first came to a hard beach, and under that to the natural hard clay, upon which the city, country, and river of Thames, are founded:

whence he drew this inference, That the sea, or current of the river, had been where now the hill is, on which the cathedral of St Paul's stands. For which Sir Christopher accounted in this manner: "The whole country between Camberwell hill and the hills of Effex, (says he), might have been a great frith or sinus of the sea, and much wider near the mouth of the Thames; which made a large plain of sand at low-water, through which the river found its way: but at low-water, in the summer-season, when the sun dried the surface of the sand, and strong wind happened at the same time, before the flood came on, the sands would dry with the winds, and raise heaps, which in time increased to large and lofty sand-hills, such as those raised in the same manner on the coasts of France and Flanders. For sands are known, upon a conjuncture of sunshine and wind, to drive into visible clouds; and this might be the effect many ages before history, without having recourse to the flood. The sand hill at St Paul's, in the time of the Roman colony, was about 12 feet lower than the present surface thereof; and the river-sand, easily driven with the wind, lay uppermost, and the hard coat of the earth might be thus made. For, pot-earth dissolved in water, and viewed by a microscope, is but impalpable sand, which with the fire will vitrefy."

The cathedral was finished in a very magnificent manner about the year 610, in the reign of Ethelbert king of Kent. It is, however, supposed to have been at first built only of wood; for it was accidentally burnt in 661, and re-built again the same year. A similar disaster befel it in the year 1086, when a considerable part of the city shared the same fate. However, such was the activity of Maurice bishop of London, and such the devotion of the people to the apostle Paul, that the cathedral was rebuilt in a much more magnificent manner than any structure applied to the purposes of devotion had ever been in England before. Maurice obtained a grant of the materials found in the ruins of a tower, called the *great palatine tower*, near Fleet-ditch, which had been burnt down at the same time, to help forward St Paul's. But the good bishop had planned this cathedral so extensively, that he was obliged to leave the finishing of it to posterity; though he prosecuted the work with the greatest diligence for 20 years. It was not fully completed till the year 1240, under the reign of Henry III. In 1444, the wooden part of the steeple was consumed by lightning. A misfortune of the same nature happened to it in 1561. The lightning struck the steeple within a yard of the weather-cock. A small light, like a torch, appeared at that place, which increased with such rapidity, that in a quarter of an hour the weather-cock fell down. The wind rising high at the same time, the whole steeple was burnt down to the battlements in an hour's time. The falling of the burning timber-work soon set fire to that which supported the bells, which by the vehemence of the conflagration were melted, and at the same time the roofs of the cathedral taking fire, the whole fabric was ruined.

After this conflagration, there was a general contribution among the clergy, nobility, great officers of state, the city of London, and queen Elizabeth herself, who gave 1000 merks of gold towards its speedy repair, with a warrant for 1000 loads of timber to be

cut

London.

*London.* cut in any of her woods; and the zeal shewn on this occasion, by persons of all ranks, had so good an effect, that in five years time, the timber roofs (the two largest whereof were framed in Yorkshire and brought from thence by sea) were entirely finished and covered with lead. But some difference in opinion arising about the model of the steeple, that part of the work was left unattempted, and never afterwards rebuilt: for, upon raising the roofs, the walls, by the corroding quality of the coal-smoke, were found to be so much decayed, that a general repair of the whole building was judged absolutely necessary; and though this was delayed from time to time, yet by the indefatigable application of Henry Farley, a private gentleman, king James came to this resolution, to undertake the arduous task of repairing the cathedral. For this purpose it was agreed to issue a proclamation under the great seal, empowering several principal personages, or any six of them, to inquire into the true state of the decays, with the cause thereof, and to consider of the necessary repairs, and the means of raising money for carrying them into execution. But it being afterwards found, that the ruin of the bishop, and of the principal dignitaries of the cathedral, was chiefly aimed at by the commissioners, the whole matter came at last to nothing. In the time of Charles I. however, between the years 1631 and 1643, no less than 101,330*l.* 4*s.* 8*d.* was laid out in repairing this cathedral. In 1643, the money, goods, and materials, bought or given for the repair of this cathedral, were seized by order of the parliament, and the body of the church was afterwards converted into horse-quarters for soldiers; a part of the building towards the east being partitioned off by a brick-wall, in the year 1649, for a preaching-place. In 1660, this was made the choir, and the other parts of the church were repaired, when the whole was destroyed by the great fire in 1666. So vehement was the heat at that time, that the stones of the walls were splintered, and came off in great flakes; so that, instead of being repaired, this magnificent cathedral now required to be rebuilt from the foundation. Immediate attention was paid to this by the king and parliament; a tax was laid upon coals for the purpose; and it was rebuilt in such a manner, as to be excelled for its architecture by no structure in the world.

The old church was 690 feet long, and 130 broad; the height of the roof of the west part from the floor being 102 feet, that of the east only 88, and that of the body 150 feet. The height of the tower was 260 feet; from whence rose a wooden spire, covered with lead, 274 feet in height. On the top of this was a ball capable of holding ten bushels of corn; and upon that ball was a cross 15 feet high, whose traverse measured six feet. This fabric covered three acres and a half, one rood and a half, and six perches, of ground. Its ornaments exceeded those of every church in the kingdom. The chapels, chantries, monuments, inscriptions, anniversaries, and all other structures in and about the old church, are largely treated of in Dugdale's history of this cathedral.

It being resolved to erect a new cathedral, which should equal, if not exceed the magnificence of the old fabric, letters patent were issued under the great seal, authorising commissioners to give directions, and to

manage that work; and appointing Sir Christopher Wren, surveyor-general of all his majesty's works, to prepare a suitable design for the fabric; and king Charles II. was graciously pleased to give 1000*l.* per annum out of his privy purse, for carrying it on. Sir Christopher endeavoured to gratify the connoisseurs with a design antique and well-studied, conformable to the best style of the Greek and Roman architecture. Of this design he caused a curious large model to be made of wood, accurately wrought, with all its proper ornaments, and presented it to his majesty: but, the bishops not approving it, as not being enough of a cathedral fashion, the surveyor was ordered to amend it; and at length produced the scheme of the present structure, which was honoured with his majesty's approbation. The surveyor, however, set a higher value on the first design than on any other he ever drew. It was only of one order, viz. the *Corinthian*, like St Peter's at Rome; and the author of his life assures us, that he would have put it in execution with more cheerfulness than that which was afterwards erected.—This original model is still preserved in the cathedral, and may be seen at a small expence.

The work was begun in 1675, and finished in 1710, at the expence of 736,752*l.* 2*s.* 3*d.* according to Mr Entick; of 800,000*l.* according to others; and of more than a million, according to Smoliet. It hath three grand porticoes, supported by stately columns, on the north, south, and west sides; the nave and choir are paved with marble, and the altar with porphyry finely polished. The dome is painted by Sir James Thornhill, with the history of St Paul's conversion; and has on its vertex a neat balcony; and above that a beautiful stone lantern near 70 feet high, with a ball and fine gilt cross at top. The church is built of Portland stone, in form of a cross, in imitation of St Peter's at Rome.

The length of the cathedral from east to west is 500 feet within the walls; the breadth, from north to south within the doors of the porticoes, 223 feet; at the entrance, 100 feet; its circuit, 2292 feet; its height within, 110 feet; to the gallery of the dome, 208 feet; to the upper gallery 276; the diameter of the dome 108 feet; from thence to the top of the cross, 64 feet; of the cross from the ball, 30 feet; the diameter of the ball, six feet; the diameter of the columns of the porticoes four feet; their height 48 feet; to the top of the west pediment under the figure of St Paul, 120 feet; of the towers at the west front 280 feet; and the extent of the ground-plot whereon it stands, two acres, 16 perches, 23 yards, one foot. This vast fabric is surrounded at a proper distance with strong iron palisades, in number about 2500; and in the area of the grand west front, on a pedestal of excellent workmanship, stands a statue of queen Anne, with proper decorations. The figures on the base represent Britannia with her spear, Gallia with a crown in her lap, Hibernia with her harp, and America with her bow; all the workmanship of the same ingenious artist. The following are the dimensions of the old cathedral compared with the new and with the church of St Peter's at Rome.

	Old St Paul's. Feet.	New St Paul's. Feet.	St. Peter's. Feet.
Length within	690	500	669
Breadth at the entrance		100	226
Front without		180	395
Broad at the crofs	130	223	442
Cupola clear		108	139
Height from the level of the ground	520	440	578
Height of the churches	150	110	146
Height of cupola and lantern		330	432

The cathedral of St Paul's is governed by a bishop, a dean, a precentor, chancellor, treasurer, five archdeacons, 30 prebendaries, 12 petty canons or minor canons, six vicars coral, and several other inferior officers. All the prebends or canopies are in the collation of the bishop of the diocese; and out of these 30 canons there are three residentiaries, besides the dean; so called from their continual residence in the church, to transact the business of the church in the chapter, and take care of her daily concerns.

4. *Westminster abbey* was founded in 610, but soon after ruined by the Danes. It was rebuilt in 1053 by the recommendation of a religious hermit, who pretended to bring a commission for that purpose from God himself. It was endowed with great privileges by king Edward the Confessor; who had them confirmed by a bull from pope Nicholas. The king also thought proper to insert that bull of confirmation in the charter granted by himself; in which bull and charter there is a remarkable clause, setting forth, "That the place where the said church and monastery were built, was anciently the seat of kings: therefore, says the pope, by the authority of God and his holy apostles and this Roman see, and our own, we grant, permit, and most solidly confirm, that hereafter for ever, it be the place of the king's consecration or coronation, and consecration; the repository of the royal crown and ensigns of majesty; and a perpetual habitation of monks, who shall be subject to no other person at all, but only to the king himself."

Westminster abbey is at present a collegiate church; and the dean and 12 prebendaries were incorporated by the name of the *dean and chapter of the collegiate church of St Peter, Westminster*, by queen Elizabeth, who also placed therein a school. The church is a magnificent pile of Gothic building, and has been adorned on the outside with the statues and figures of all the princes that have contributed towards the finishing of it. But this abbey suffered so much at the dissolution of the monastery, and during the civil commotions in the time of Charles I. that it gradually decayed almost to the present time, when the parliament ordered a thorough reparation at the national expence. In consequence of this interposition, the whole fabric has been new-coated, except that part called *king Henry VII's chapel*, and the west end has been made more magnificent by the addition of two towers rebuilt in as masterly a manner as any other part of the abbey, but the beautiful carving and the statues with which it was once adorned are now lost.

The extent of this building is 360 feet within the walls, 72 feet broad at the nave, and 195 at the crofs.

The Gothic arches and side ailes are supported by 48 pillars of grey marble, each composed of clusters of very slender ones, and covered with ornaments. The grand entrance into the choir is by a pair of fine iron gates, on each side of which is a very magnificent tomb. The floor is paved with the handsomest blue and white marble. The stalls are covered with Gothic acute arches, supported by small iron pillars, and painted purple. At the east end is the altar, made of a beautiful piece of marble, the gift of queen Anne, inclosed by a curious balustrade, and upon a pavement of porphyry, jasper, Lydian, and serpentine stones, laid in the Mosaic stile, at the expence of abbot Ware, A. D. 1727; and is said to be one of the most beautiful of its kind in the world.

On each side of this altar a door opens into St Edward's chapel; round which are ten other chapels, ranging from the north to the south crofs ailes, and are dedicated, 1. To St Andrew. 2. To St Michael. 3. To St John Evangelist. 4. *Isis's* chapel. 5. To St John Baptist. 6. To St Paul. 7. Henry V.'s chapel. 8. To St Nicholas. 9. To St Edmund. 10. To St Benedict.

In St Edward's chapel are still to be seen the remains of his shrine; which, though now in obscurity, and robbed of all its riches and lustre, was once esteemed the glory of England, so far as art and riches could make it. Here are the tombs of king Edward I. and several other kings and queens of England; and here also is shown the famous chair in which the kings of Scotland used to be crowned at Secon. Henry V's chapel is divided from St Edward's by an iron screen, on each side of which are statues as big as life.—St Andrew's chapel, which is next the north crofs, and the others which surround the choir, are crowded with the monuments of noble personages, worth the attention of the curious.—At the corner of St Benedict's chapel, an iron gate opens into the south crofs aisle; which from the number of monuments erected therein to celebrated English poets, has obtained the name of the *poets' corner*: though here we find a most magnificent monument erected at the south end in memory of the late John duke of Argyle and Greenwich; another to William Camden the antiquarian; and others to the celebrated divine Dr Isaac Barrow, to Thomas Parr who died at the age of 152 years, &c.

The fourth aisle is adorned with 19 curious monuments of the pious, the brave, and the learned. Amongst whom, next the entrance at the west end, is a noble monument, erected by order of parliament, in honour of the brave captain Cornwall. And turning northward from the west door, we view 48 more monuments worthy of notice.

On the east of the abbey, and which, though separate from the other chapels in the choir, seems to be one and the same building with the abbey, stands the chapel of king Henry VII. which that king founded in the year 1502, and was at that time styled *the wonder of the world*, and is now one of the most expensive remains of the ancient English taste and magnificence. There is no looking upon it without admiration: it conveys an idea of the fine taste of Gothic architecture in that age; and the inside is so noble, majestic, and of such curious workmanship, that it would take a volume to describe each part with justice and propriety.

Its original intention was to be a dormitory for the royal blood: and so far the will of the founder has been observed, that none have been interred therein, but such as have traced their descent from ancient kings. The tomb of king Henry VII. is most magnificent, inclosed with a screen of cast bras, most admirably designed, and as well executed. Within the rails are the figures of that king and his royal consort, in their robes of state, on a tomb of black marble: and at the head of this tomb lie the remains of Edward VI. In different parts of this chapel are the monuments of Lewis Stuart duke of Richmond, George Villars duke of Buckingham, John Sheffield duke of Buckingham, Charles Montague marquis of Halifax, Edward V. and his brother Richard; the vault of James I. and his queen Anne, and daughter Mary, on which is a small tomb adorned with the figure of a child; a lofty monument of queen Elizabeth, and another of Mary queen of Scots; the monuments for Margaret Douglas, daughter of Margaret queen of Scots, Margaret countess of Richmond mother to Henry VII. the vault of king Charles II. and William III. queen Mary his consort, queen Anne and prince George. Over these royal personages are their effigies (except that of prince George) in waistcoat puffs, made of wax to resemble life, and dressed in their coronation robes. And at the corner of the great east window, in another waistcoat press, stands the effigy of Mary duchess of Richmond, daughter to James duke of Richmond and Lenox, dressed in the very robes she wore at the coronation of queen Anne. On leaving the aisle, you are shewn another press, containing the effigy of general Monk, who, on account of his loyalty, and part he took in the restoration of king Charles II. had a vault appropriated to him and his family, amongst the royal blood. It only remains to observe, that the royal family of the house of Hanover are interred in a vault under the centre of this chapel; without any monumental inscription or ornaments.

5. *Westminster-hall*, built by William Rufus, as an addition to the palace of Westminster, was rebuilt, A.D. 1397, by king Richard II. with additional apartments on the east and west sides, and called the *new palace*, to distinguish it from the old palace, where the house of lords and commons now assemble. The front of this hall is narrow, built with stone in the Gothic taste, with a tower on each side the entrance, adorned with much carved work. The part called the *hall*, is supposed to be the largest room in Europe not supported by pillars, being 270 feet long, and 74 broad. It is a regular Gothic structure. In this hall we find the high courts of equity and justice; the high court of chancery at the north-west corner, and the court of king's bench at the south-west corner: about the middle on the north-side is the court of common-pleas; and at the north-east corner is his majesty's court of exchequer.

In the south-west angle of new palace-yard stands the exchequer, or the office of the receipt of his majesty's exchequer: a plain old building of wood and plaster, where the king's revenue is received and disbursed: and to which belong the several offices called the *pipe-office* in Gray's inn, *foreign exchequer's office* and *king's remembrancer's office* in the Temple; *clerk of the pleas office*, in Lincoln's-inn, &c.

VOL. VI.

Behind, to the westward of Westminster-hall and the exchequer, we come to the seat of judicature, the house of commons and the house of lords.

The house of commons, composed of the representatives of the people, and elected by them for counties, cities, and boroughs, sit upon national affairs in St Stephen's chapel, at the south-west angle of Westminster-hall, built originally by king Stephen; and has been appropriated to its present use ever since the reign of king Edward VI. and now called the *house of commons*; to which there is a communication and an ascent from Westminster-hall, by a dark entry and a grand flight of stone stairs.

From hence passing through a kind of hall paved with stone, called the *court of requests*, used chiefly by those who attend the parliament to walk in, we come, on the left hand, into the house of Lords, a spacious lofty room, well disposed for the convenience of the peers of the realm, who sit there upon national affairs, and concur with the commons in making laws to be signed by the sovereign upon the throne, and hung with tapestry representing the defeat of the Spanish armada.

6. *Guild-hall* stands at the north end of King street. In it the nine courts of the city are kept, viz. 1. The court of common-council. 2. The court of the lord-mayor, and his brethren the aldermen. 3. The court of husting. 4. The court of orphans. 5. The two courts of the sheriffs. 6. The court of the wardmote. 7. The court of hallmote. 8. The court of requests, commonly called the *court of conscience*. 9. The chamberlain's court for binding apprentices, and making them free.

The guildhall stood formerly in or near Aldermanbury, or Aldermens-court, from which situation of this hall the street is said to take its denomination, and consequently the hall must have been founded before the year 1189; for then we find this street to have had that name. And it is not unlikely that Edward the Confessor, who began to reign in 1042, had a considerable share in the first foundation, his arms being in several places of this present hall: "Which (Robert Fabian saith) was begun to be new-built in the year 1411, the 12th of Henry IV. by Thomas Knowles, then mayor, and by his brethren the aldermen. The same was made, of a little cottage, a large and great house, as it now stands. Towards the charge whereof the companies gave great benevolences. Also offences of men were pardoned for sums of money towards this work; and extraordinary fees were raised, fines, amerciaments, and other things employed, during seven years, and a continuation thereof three years more; all to be employed to this building."

This stately hall being much damaged by the unhappy conflagration of the city in the year 1666, was restored anno 1679, and extremely well beautified and repaired both in and out-side, which cost about 2500l. The portico is adorned with a stately Gothic frontispiece, enriched with the king's arms under a cornice, pediment, and vase, and between two cartouches and the city-supporters, on acroters, and these between two other vases, under which are niches; and in the middle of this front are dependic in gold these words:

*Reparata & ornata Thoma Ralifon, milit. Majore,*  
*An. Dom. MDCCVI.*

24 I

Above

London. Above the balcony are the figures of Moses and Aaron; on the sides beneath, are the four cardinal virtues, over the aperture; and below the balcony are depicted the arms of the 24 companies.

The roof of the inside is flat, divided into pannels; the walls on the north and south sides are adorned with four Gothic demi-pillars, painted white, and veined with blue, and the capitals gilt with gold, upon which are the royal arms, and those of Edward the Confessor. Going up nine or ten steps to the mayor's court, on each side, at some height, are two giants of an enormous size, the one holding a pole ax, the other an halbert; supposed by Mr Strype to be an ancient Briton and a Saxon.

Between these, and over the steps and aperture leading to the mayor's court, is a balcony, supported at each end by four iron pillars in the form of palm trees, which compose something like two arbours: under these are the following large capital letters, S. P. Q. L. i. e. *Senatus Populusque Londinensis*.

Round the hall, on 14 demi-pillars above the capitals, are the king's arms on the north-eastward, and the arms of London on the south-eastward pillar; and westward from thence are the arms of the 12 companies; at the east end are the king's arms between the portraits, finely painted, of their late majesties king George II. and queen Caroline: close by the first is the picture of queen Anne, at the foot of an anabathrum, under a rich canopy; by the latter, his late majesty king George I. and at the same end of the hall, but on the north and south sides, the pictures of king William III. and queen Mary, fronting each other. The intercolumns are painted in imitation of porphyry, and embellished with the pictures, in full proportion, of 18 judges, which were there put up by the city in gratitude for their signal services done in determining differences between landlord and tenant (without the expence of law-suits), in rebuilding the city, pursuant to an act of parliament, after the fire in 1666.

This hall is in length 153 feet, breadth 48, and altitude within 55. It is used by the city for the session of the several courts of judicature before named; for feasting our kings, queens, and other potentates, foreign ministers, &c.; and lastly, for choosing the lord-mayor, sheriffs, members of parliament, &c. it being capacious enough to contain 7000 persons.

7. The college of physicians stands on the west side of Warwick-lane in Farringdon-road without. It is a most noble edifice of brick and stone. The entrance is grand, under an octagonal theatre, finishing in a dome, with a cone at the top making a lantern to it. The inside is elegant, finely enlightened, and very capacious; designed by Sir Christopher Wren. The central building, which contains the library and other rooms of state and convenience, was the design of Inigo Jones. The ascent to the door is by a flight of steps, and in the under part is a calemment story. On one side, over the door-case, is the statue of king Charles II. in a niche; on the other side, the statue of Sir John Cutler. The whole front is decorated with pilasters of the Ionic and Corinthian orders. The buildings at the two sides of the court are uniform, with window-cases handsomely ornamented. Within is a great hall for the quarterly meetings of the doctors, adorned with pictures and sculpture; a theatre for anatomical dissection; a

preparing room, where there are 13 tables, containing all the muscles, &c. of the human body; a library well furnished with books; a committee-room; a hall in which the physicians sit to give advice gratis to the poor; besides the different apartments for the servants, officers, &c.

The physicians were incorporated in the 10th of Henry VIII. An account of their constitution and privileges is given under the article COLLEGE.

8. The *British Museum*, a magnificent building situated in Russell-Street, and containing an amazing number of curiosities, is described under the article MUSEUM.

9. *Ranelagh Gardens* are one of those public places of pleasure about this metropolis, which are not to be equalled in any part of Europe. The gardens themselves are very beautiful; but the amphitheatre is much more to be admired. It is a circular building, whose external diameter is 185 feet. Round the whole is an arcade; over that, a gallery and ballustrade, (to admit the company into the upper-boxes,) except where the entrances break the continuity; and over this are the windows and roof. The internal diameter is 150 feet; and the architecture of the inside corresponds with the outside, except that over every column, between the windows, termini support the roof. In the middle of the area is a chimney with four faces, which makes it warm and comfortable in cold weather. The orchestra fills up the place which was originally one of the entrances. The orchestra then stood on the centre, where the chimney is at present. The entertainment consists of a fine band of music, with an organ, and some of the best voices: and the regale is tea and coffee, included in the money paid for entrance.

10. *Vauxhall Gardens*, which take their name from the village of Vauxhall, about two miles from London bridge, in the parish of Lambeth and county of Surrey, are also celebrated all over Europe for the entertainment they afford. A noble gravel-walk, of about 900 feet in length, planted on each side with very lofty trees, which form a fine vista, leads from the great gate, and is terminated by a landscape of the country, a beautiful lawn of meadow-ground, and a grand Gothic obelisk. At the corners of the obelisk are painted a number of slaves chained, and over them this inscription:

SPECTATOR  
FASTIDIOSUS  
SIBI MOLESTUS.

To the right of this walk, and a few steps within the garden, is a square, which, from the number of trees planted in it, is called the *grove*; in the middle of it is a magnificent orchestra of Gothic construction, ornamented with carvings and niches, the dome of which is surmounted with a plume of feathers, the crest of the prince of Wales. In fine weather, the musical entertainments are performed here. At the upper extremity of this orchestra a very fine organ is erected; and at the foot of it are the seats and desks for the musicians, placed in a semicircular form, leaving a vacancy at the front for the vocal performers. The concert is opened with instrumental music at six o'clock; which having continued about half an hour, the company are entertained with a song; and in this manner several other songs are performed, with sonatas and

and concertos between the cars, till the close of the entertainment, which is generally about 10 o'clock. A curious piece of machinery is exhibited about 9 o'clock, in a hollow on the left hand, about half-way up the walk already described, representing a beautiful landscape in perspective, with a miller's house, a water-mill, and a cascade. The grove is illuminated in the evening with about 1500 glass lamps; in the front of the orchestra they are contrived to form three triumphal arches, and are all lighted, as it were, in a moment. In cold or rainy weather, the musical performance is in a rotunda 70 feet in diameter, on the left side of the entrance into the gardens, nearly opposite to the orchestra. Along the front, next the grove, is a piazza formed by a range of pillars, under which is the entrance from the grove. The front of the ceiling is supported by four columns of the Ionic order, embellished with foliage from the base a considerable way upwards; and the remaining part of the shaft, to the capital, is finely wreathed with a Gothic ballustrade, where boys are represented ascending it. In the centre hangs a magnificent chandelier, 11 feet in diameter, containing 72 lamps in three rows. The top is a dome, slated on the outside, and painted within like a shell. The roof is so contrived, that sounds never vibrate under it. A part of the rotunda is laid open for receiving a saloon; and its entrance here is formed and decorated with columns like those in the front of the orchestra. In the roof, which is arched and elliptic, are two little cupolas in a peculiar taste, and adorned with painting; and in the summit of each is a sky-light, divided into 10 compartments, with frames in the Gothic style. Above each cupola is an arch divided into compartments; from the centre of each of which, depends a large chandelier, in the form of a basket of flowers. Adjoining to the walls are 30 three-quarter columns. Between these columns are four paintings by Hayman, on subjects of British glory.

The entrance into this saloon from the gardens is through a Gothic portal. The pavilions or alcoves are ornamented with paintings from the designs of Mr Hayman and Mr Hugarth, on subjects adapted to the place; and each pavilion has a table in it large enough for six or eight persons. The pavilions continue in a sweep, which leads to a beautiful piazza, and a colonnade 500 feet in length, in the form of a semicircle, of Gothic architecture, embellished with rays. This semicircle leads to a sweep of pavilions that terminate in the great walk. Near the centre of the gardens is a cross gravel-walk formed by stately trees on each side. On the right hand, it is terminated by the trees which shade the lover's walk; and at the extremity on the left, is a beautiful landscape painting of ruins and running water. At each end of another walk is a beautiful painting: one is a building, with a scaffold and a ladder before it, which has often deceived the eye; the other is a view in a Chinese garden. The principal part of all those walks forms the boundaries of wildernesses composed of trees which shoot to a great height, and are all inclosed with an espalier in the Chinese taste.

11. *The Monument* is a great fluted pillar, of the Doric order, erected in memory of the conflagration in 1666. It is situated on the east side of Fish-street

hill, facing Crooked-lane. It was begun by Sir Christopher Wren in 1671, and finished by him in 1677. Its height from the pavement is 202 feet; the diameter of the shaft, or body of the column, is 15 feet; the ground-plinth, or lowest part of the pedestal, is 28 feet square; and the pedestal is 40 feet high. Over the capital is an iron balcony encompassing a cone 32 feet high, which supports a blazing urn of gilt brass. Within is a large stair-case of black marble, containing 345 steps, each 10 inches and a half broad, and six inches thick. The well side is adorned with a curious emblem in alt-relief, denoting the destruction and restoration of the city. The first female figure represents London sitting in ruins, in a languishing posture, with her head dejected, her hair dishevelled, and her hand carelessly lying on her sword. Behind is *Time*, gradually raising her up: at her side is a woman touching her with one hand, whilst a winged sceptre in the other directs her to regard the goddesses in the clouds; one with a cornucopia, denoting *Plenty*; the other with a palm branch, the emblem of *Peace*. At her feet is a bee-hive, shewing, that by industry and application the greatest misfortunes are to be overcome. Behind the figure of *Time* are citizens exulting at his endeavours to restore her; and beneath, in the midst of the ruins, is a dragon, who, as the supporter of the city-arms, with his paw endeavours to preserve the same. Opposite to the city, on an elevated pavement, stands the king, in a Roman habit, with a laurel on his head, and a truncheon in his hand; and approaching her, commands three of his attendants to defend to her relief. The first represents the *Sciences*, with a winged head, and circle of naked boys dancing thereon; and holding *Nature* in her hand, with her numerous breasts, ready to give assistance to all. The second is *Architecture*, with a plan in one hand, and a square and pair of compasses in the other; and the third is *Liberty*, waving a hat in the air, shewing her joy at the pleasing prospect of the city's speedy recovery. Behind the king stands his brother the duke of York, with a garland in one hand to crown the rising city, and a sword in the other for her defence. The two figures behind are *Justice* and *Fortitude*; the former with a coronet, and the latter with a reined lion; and under the royal pavement lies *Envy*, gnawing a heart, and incessantly emitting pestiferous fumes from her mouth. On the plinth the reconstruction of the city is represented by builders and labourers at work upon houses. On the north, south, and east sides, are inscriptions relating the destruction occasioned by the conflagration, the regulations about rebuilding the city, and erecting the monument; and round it is the following one:—"This pillar was set up in perpetual remembrance of the most dreadful burning of this Protestant city, begun and carried on by the treachery and malice of the Popish faction, in the beginning of September, in the year of our Lord 1666, in order to their carrying on their horrid plot for extirpating the Protestant religion and old English liberty, and introducing Popery and slavery."

The city and liberties of London are under a civil, ecclesiastical, and military government. 30  
Government of the city.

The *civil* divides divides it into wards and precincts, under a lord-mayor, aldermen, and common-council;

London. the ecclesiastical into parishes, under a bishop, archdeacon, and ministers or pastors; and the *military* is the militia, under the power of a lord-lieutenant, which is lodged in the mayor and aldermen, and some of the principal citizens, the city being erected by charter a county-corporate, and a lieutenancy by itself. London.

The civil government of this city, in its present form, may be said, in every respect, to resemble the legislative power of the nation; the mayor, aldermen, and common-council men, making laws and governing the city of London, as the king, lords, and commons, preside over, govern, and make laws for the whole nation.

31  
Lord-mayor.

The mayor, or lord-mayor, is the supreme magistrate of London, chosen annually by the citizens, pursuant to a charter of king John. The present manner of electing a lord-mayor is by the liverymen of the several companies, assembled in Guildhall annually on Michaelmas-day, according to an act of common-council, A. D. 1476, where, and when, the livery-men choose, or rather nominate, two aldermen below the chair, who have served the office of sheriff, to be returned to the court of aldermen, who may choose either of the two; but generally declare the senior of the two, to be lord-mayor elect. The election being over, the lord-mayor elect, accompanied by the recorder and divers aldermen, is soon after presented to the lord-chancellor (as his majesty's representative in the city of London) for his approbation; and on the 9th of November following is sworn into the office of mayor, at Guildhall; and, on the day after, before the barons of the exchequer at Westminster; the procession on which occasion is exceedingly grand and magnificent.

The lord-mayor sits every morning at the mansion-house, or place where he keeps his mayoralty, to determine any difference that may happen among the citizens, and to do other business incident to the office of a chief magistrate. Once in six weeks, or eight times in the year, he sits as chief judge of Oyer and Terminer, or gaol-delivery of Newgate for London and the county of Middlesex. His jurisdiction extends all over the city and suburbs, except some places that are exempt. It extends also from Colneyditch, above Staines bridge in the west, to Yeudale, or Yenslete, and the mouth of the river Medway, and up that river to Upnor castle, in the east: by which he exercises the power of punishing or correcting all persons that shall annoy the streams, banks, or fish. For which purpose his lordship holds several courts of conservancy in the countries adjacent to the said river, for its conservation, and for the punishment of offenders.

32  
Aldermen.

The title of dignity, *alderman*, is of Saxon original, and of the greatest honour, answering to that of earl; though now it is nowhere to be found but in chartered societies. And from hence we may account for the reason why the aldermen and commonalty of London were called *barons* after the conquest. These magistrates are properly the subordinate governors of their respective wards under the lord-mayor's jurisdiction: and they originally held their aldermanries either by inheritance or purchase; at which time the aldermanries or wards changed their names as often as their governors or aldermen. The oppressions, to which the

citizens were subject from such a government, put them upon means to abolish the perpetuity of that office; and they brought it to an annual election. But that manner of election being attended with many inconveniences, and becoming a continual bone of contention amongst the citizens, the parliament, 17 Richard II. A.D. 1394, enacted, That the aldermen of London should continue in their several offices during life or good behaviour. And so it still continues: though the manner of electing has several times varied. At present it is regulated by an act of parliament, passed in the year 1724-5; and the person so elected is to be returned by the lord mayor (or other returning officer in his stead, duly qualified to hold a court of wardmote) to the court of lord mayor and aldermen, by whom the person so returned must be admitted and sworn into the office of aldermen before he can act. If the person chosen refuseth to serve the office of alderman, he is fineable 500*l*.

These high officers constitute a second part of the city legislature when assembled in a corporate capacity, and exercise an executive power in their respective wards. The aldermen who have passed the chair, or served the high office of lord mayor, are justices of the quorum; and all the other aldermen are not only justices of the peace, but by the statute of 43 Eliz. intitled, *An act for the relief of the poor*, "every alderman of the city of London, within his ward, shall and may do and execute, in every respect, so much as is appointed and allowed by the said act to be done or executed by one or two justices of peace of any county within this realm." They every one keep their *wardmote*, or court, for choosing ward-officers and settling the affairs of the ward, to redress grievances, and to prevent all defaults found within their respective wards.

The next branch of the legislative power in this city is the *common-council*. The many inconveniences that attended popular assemblies, which were called *folk-mote*, determined the commonalty of London to choose representatives to act in their name and for their interest, with the lord-mayor and aldermen, in all affairs relating to the city. At first these representatives were chosen out of the several companies; but that not being found satisfactory, nor properly the representatives of the whole body of the inhabitants, it was agreed to choose a certain number of discreet men out of each ward: which number has from time to time increased according to the dimensions of each ward: and at present the 25 wards, into which London is divided, being subdivided into 236 precincts, each precinct sends a representative to the common-council, who are elected after the same manner as an alderman, only with this difference, that as the lord-mayor presides in the wardmote, and is judge of the poll at the election of an alderman, so the alderman of each ward is judge of the poll at the election of a common-council man.

Thus the lord-mayor, aldermen, and common-council, when assembled, may be deemed the city parliament, resembling the great council of the nation. For it consists of two houses; one for the lord-mayor and aldermen, or the upper-house; another for the commoners or representatives of the people, commonly called the *common-council men*. And they have power in their incorporate capacity to make and repeal by-laws;

London,

laws; and the citizens are bound to obey or submit to those laws. When they meet in their incorporate capacity, they wear deep-blue silk gowns; and their assemblies are called the *court of common-council*, and their ordinances *acts of common-council*. No act can be performed in the name of the city of London without their concurrence. But they cannot alienate without a summons from the lord-mayor: who, nevertheless, is obliged to call a common-council, whenever it shall be demanded, upon extraordinary occasions, by six reputable citizens and members of that court.

34  
Sheriffs, recorder, &c.

This corporation is assisted by two sheriffs and a recorder. The sheriffs are chartered officers, to perform certain suits and services, in the king's name, within the city of London and county of Middlesex, chosen by the liverymen of the several companies on Midsummer-day. Their office, according to Camden, in general, is to collect the public revenues within their several jurisdictions; to gather into the exchequer all fines belonging to the crown; to serve the king's writs of process; to attend the judges, and execute their orders; to impanel juries; to compel headstrong and obstinate men by the *pisse comitatus* to submit to the decisions of the law; and to take care that all condemned criminals be duly punished and executed. In particular, in London, they are to execute the orders of the common-council, when they have resolved to address his majesty, or to petition parliament.

The sheriffs, by virtue of their office, hold a court at Guildhall every Wednesday and Friday, for actions entered at Wood-street Compter; and on Thursdays, and Saturdays for those entered at the Poultry Compter: of which the sheriffs being judges, each has his assistant, or deputy, who are called the judges of those courts; before whom are tried actions of debt, trespass, covenant, &c. and where the testimony of any absent witness in writing is allowed to be good evidence. To each of these courts belong four attorneys, who, upon their being admitted by the court of aldermen, have an oath administered to them.

To each of these courts likewise belong a secondary, a clerk of the papers, a prothonotary, and four clerks-fitters. The secondary's office is to allow and return all writs brought to remove clerks out of the said courts; the clerk of the papers files and copies all declarations upon actions; the prothonotary draws and ingrosses all declarations; the clerks-fitters enter actions and attachments, and take bail and verdicts. To each of the compters, or prisons belonging to these courts, appertain 16 sergeants at mace, with a yeoman to each, besides inferior officers, and the prison-keeper.

In the sheriffs court may be tried actions of debt, case, trespass, account, covenant, and all personal actions, attachments, and sequestrations. When an erroneous judgment is given in either of the sheriffs courts of the city, the writ of error to reverse this judgment must be brought in the court of hustings before the lord mayor; for that is the superior court. The sheriffs of London may make arrests and serve executions on the river Thames.

We do not read of a recorder till the year 1304, who, by the nature of his office, seems to have been intended as an assistant to, or assessor with, the lord mayor, in the execution of his high office, in matters of justice

London.

and law. He is chosen by the lord-mayor and aldermen only; and takes place in all courts, and in the common-council, before any one that hath not been mayor. Of whom we have the following description in one of the books of the chamber. "He shall be, and is wont to be, one of the most skilful and virtuous apprentices of the law of the whole kingdom; whose office is always to sit on the right hand of the mayor, in recording pleas, and passing judgments; and by whom records and processes, had before the lord-mayor and aldermen at Great St Martin's, ought to be recorded by word of mouth before the judges assigned there to correct errors. The mayor and aldermen have therefore used commonly to fet forth all other business, touching the city, before the king and his council, as also in certain of the king's courts, by Mr Recorder, as a chief man, endued with wisdom, and eminent for eloquence."

Mr recorder is looked upon to be the mouth of the city, to deliver all addresses to the king, &c. from the corporation; and he is the first officer in order of precedence that is paid a salary, which originally was no more than 10*l.* Sterling *per annum*, with some few perquisites; but it has from time to time been augmented to 280*l.* *per annum*, and become the road to preferment in the law. This office has sometimes been executed by a deputy.

The next chartered officer of this corporation is the chamberlain; an office of great repute and trust, and is in the choice of the livery annually. This officer, though chosen annually on Midsummer-day, is never displaced during his life, except some very great crime can be made out against him. He has the keeping of the moneys, lands, and goods, of the city-orphans, or takes good security for the payment thereof when the parties come to age. And to that end he is deemed in the law a sole corporation, to him and his successors, for orphans; and therefore a bond or a recognizance made to him and his successors, is recoverable by his successors. This officer hath a court peculiarly belonging to him. His office may be termed a public treasury, collecting the customs, moneys, and yearly revenues, and all other payments belonging to the corporation of the city. It has been generally customary for the government to appoint the chamberlain receiver of the land-tax.

The other officers under the lord-mayor are, 1. The Other officers.  
common serjeant. He is to attend the lord-mayor and

court of aldermen on court-days, and to be in council with them on all occasions, within or without the precincts or liberties of the city. He is to take care of orphans estates, either by taking account of them, or to sign their indentures, before their passing the lord-mayor and court of aldermen. And likewise he is to let, set, and manage the orphan's estates, according to his judgment, to the best advantage.

2. The town-clerk; who keeps the original charter of the city, the books, rolls, and other records, wherein are registered the acts and proceedings of the city; so that he may not be improperly termed the city-registrar: he is to attend the lord-mayor and aldermen at their courts, and signs all public instruments.

3. The city-remembrancer; who is to attend the lord-mayor on certain days, his business being to put  
his

London. his lordship in mind of the select days he is to go abroad with the aldermen, &c. He is to attend daily at the parliament-house, during the sessions, and to report to the lord-mayor their transactions.

4. The sword-bearer; who is to attend the lord-mayor at his going abroad, and to carry the sword before him, being the emblem of justice. This is an ancient and honourable office, representing the state and princely office of the king's most excellent majesty, in his representative of the lord-mayor; and, according to the rule of armory, "He must carry the sword upright, the hilts being holden under his bulk, and the blade directly up the midst of his breast, and so forth between the sword-bearer's brows."

5. The common-hunt; whose business is to take care of the pack of hounds belonging to the lord-mayor and citizens, and to attend them in hunting in those grounds to which they are authorized by charter.

6. The common-crier. It belongs to him and the serjeant at arms, to summon all executors and administrators of freemen to appear, and to bring in inventories of the personal estates of freemen, within two months after their decease: and he is to have notice of the appraisements. He is also to attend the lord-mayor on set days, and at the courts held weekly by the mayor and aldermen.

7. The water-bailiff; whose office is to look after the preservation of the river Thames, against all encroachments; and to look after the fishermen for the preservation of the young fry, to prevent the destroying them by unlawful nets. For that end there are juries for each county, that hath any part of it lying on the sides or shores of the said river; which juries, summoned by the water-bailiff at certain times, do make inquiry of all offences relating to the river and the fish, and make their presentments accordingly. He is also bound to attend the lord-mayor on set days in the week.

N. B. These seven purchase their places; except the town-clerk, who is chosen by the livery.

There are also three serjeant-carvers; three serjeants of the chamber; a serjeant of the channel; four yeomen of the water-side; an under water-bailiff; two yeomen of the chamber; two meal weighers; two yeomen of the wood wharfs; a foreign taker; city-marshals. There are besides these, seven gentlemen men; as, The sword bearer's man, the common hunt's two men, the common-crier's man, and the carver's three men.

Nine of the foregoing officers have liveries of the lord-mayor, viz. the sword-bearer and his man, the three carvers, and the four yeomen of the water-side. All the rest have liveries from the chamber of London.

The following officers are likewise belonging to the city; farmer of the markets, auditor, clerk of the chamber, clerk to the commissioners of the sewers, clerk of the court of conscience, beadle of the same court, clerk of the city-works, printer to the city, justice of the Bridge-yard, clerk-comptroller of the Bridge-house, steward of the Borough, bailiff of the Borough.

There are also a coroner, called so from *corona*, i. e. a *crown*, because he deals principally with the crown,

or in matters appertaining to the imperial crown of England. As to the antiquity of this office, there were coroners in the time of king Alfred, as appears by the book intitled *The mirror*. The lord-mayor for the time being, is coroner, but hath his deputy for the management thereof. In ancient time, this office was of such great esteem, that none could execute it under the degree of a knight. As the sheriff may inquire of all felonies, so the coroner is to inquire of all sudden deaths; and to that end he impanels a jury, takes evidence upon oath, and gives the charge to the jury.

Besides these officers, there are several courts in this city for the executing of justice, viz. the court of hustings, lord-mayor's court, &c. In the city there are also two subordinate kinds of government. One executed by the alderman, deputy, and common council men, and their inferior officers, in each ward; under which form are comprehended all the inhabitants, free or not free of the city. Every ward is therefore like a little free state, and at the same time subject to the lord-mayor as chief magistrate of the city. The housekeepers of each ward elect their representatives the common-council, who join in making bye-laws for the government of the city. The officers and servants of each ward manage the affairs belonging to it, without the assistance of the rest; and each has a court called the *wardmote*, as has been already described, for the management of its own affairs. The other, by the master, wardens, and court of assistants, of the incorporate companies; whose power reaches no further than over the members of their respective guilds or fraternities; except that in them is invested the power to choose representatives in parliament for the city, and all those magistrates and officers elected by a common-hall: which companies are invested with distinct powers, according to the tenor of their respective charters.

With regard to the number of inhabitants in London, they have commonly been reckoned at a million, or at least upwards of 700,000; but Mr Entick reduces this number to 500,000, and indeed considerably reduces the supposed number of inhabitants in several other great cities, altho' he estimates the number of houses in London at 100,000.

"If we compare London, (says he), with other cities both ancient and modern, we shall find that our metropolis is the most numerous. Nineveh, though its walls are said to encompass 480 furlongs, or 60 miles, does not appear to have contained above 403,000 citizens, which is 97,000 less than London. Babylon was also 60 English miles in compass, and not allowed to contain more than 487,921 inhabitants, which is 12,079 less than London. As to Jerusalem, the inhabitants did not amount to more than a sixth part of the present inhabitants of this metropolis. Rome has been the subject of many panegyrics; but, in its utmost extent, it never entertained more than 367,448, which is 132,552 less than in London. Constantinople is at this time allowed to have no more than 420,000 inhabitants; Grand Cairo no more than 300,000; Peking in China no more than 412,610: and to conclude this parallel, it may be concluded that Paris, whose enormity has been so extravagantly published, does not contain more than 437,438 inhabitants.

"Another method to arrive at some certainty about the

36  
Number of  
inhabitants.

London-  
derry.

the number of inhabitants in such a vast place, is, that it has been calculated upon a presumption of the number of mouths, which consume yearly 369,635 quarters, and upwards, of wheat flour; 98,244 cattle; 711,123 sheep and lambs: 194,760 calves; 186,932 hogs; 52,000 sucking pigs; 115,536 bushels of oylers; 14,740,000 mackarel; 16,366,728 pounds of butter; 21,066,000 pounds of cheese; besides the infinite quantities of fowls of all sorts, of fish of all sorts, and of garden-stuff and milk: of which last article, reckoning only a gallon to each house in a week, there is expended annually 5,200,000 gallons. And in the year from Midsummer 1759 to 1760 there were brewed in the city and suburbs, 975,217 barrels and three firkins of beer.

LONDONDERRY, or COLERAINE, a county of Ireland, in the province of Ulster. It is bounded on the south and south-west by the county of Tyrone; by Antrim on the east, from which it is parted by the river Bann; by Donegal, on the west; and that county and the Deucalionian ocean, on the north. Its greatest length is about 36 miles, its breadth 30, containing about 251,510 acres. The bogs and heaths of this country are manured with sea-shells, as those of Donegal. Like that too, it is pretty champaign, and not unfruitful. It is particularly noted for a very clear river called the *Bann*, abounding with salmon, a fish said to delight in limpid streams. This river, to distinguish it from a lesser of the same name, is called the *Greater or Lower Bann*. In order to cultivate, settle, and civilize this county, king James I. granted it, by letters-patent, to a society, by the name of the *Governor and Assistants at London of the new plantation of Ulster in the realm of Ireland*. It contains six baronies; and, besides the two knights of the shire, sends to parliament two members for the city of Londonderry, and two each for Coleraine, and Newton-Limavady or Lamnavady.

LONDONDERRY, or *Derry*, the capital of the county, and the see of a bishop, stands at the bottom of Lough-Foyle. This city has a very good port, to which ships of the greatest burden have access, and a considerable trade. It will be ever famous for the gallantry and perseverance with which it defended itself in three memorable sieges, in defiance of the greatest hardships and discouragements, namely, 1st, In 1641, when the rebels could not reduce it either by fraud or force. 2dly, In 1649, when it was besieged by the lord Ardes, and reduced almost to extremity by famine, till at last relieved by troops sent from England. 3dly, When it held out against the French and Irish from the 7th of December 1688, to the last day of July 1689, though it was neither well fortified, nor provided with a garrison or stores of provision and ammunition, and hardly any attempt made to relieve it during so long a time. Though the city is 20 miles up the river, yet very large ships can come up to the quay, where there is four or five fathoms of water. It is now well fortified with a strong wall, besides outworks; and along the banks of the river are several callies, and a fort. This city is of no great antiquity, having been built and planted in the reign of James I. by a colony sent by the society abovementioned. The trade of the town is very considerable, having not only a large

share in the herring-fishery, but sending ships also to the West-Indies, New-England, and Newfoundland, for which they are so advantageously situated, that a vessel bound from thence to America often arrives there before a London ship can get clear of the soundings, or arrive in the latitude of Londonderry. 'Tho' there are a great many shallows in Lough-Foyle, which serves it instead of a road; yet they are easily avoided, as there are deep channels between them. Those points called *Enniffone*, *Rufferhull*, or *Cully-lead*, which lie a little to the west of the mouth of the harbour, are counted the most northerly of Ireland, lying in lat. 55. 20. The inhabitants of this city are almost all Protestants. It gives title of *earl* and *baron* to a branch of the family of Pitt. A late traveller says, "Derry is, perhaps, the cleanest, best built, and most beautifully situated town in Ireland; and, excepting Corke, as convenient as any for commerce, foreign and domestic; and, but for the restrictions on the trade of Ireland, would in a few years become a flourishing and wealthy city." The lake almost surrounds it; and the whole ground-plat both of it and its liberties belongs to the 12 great companies of London. Great quantities of salmon, flax and barrells, are exported from hence to America.

LONG, an epithet given to whatever exceeds the usual standard of length.

LONG-BOAT, the largest and strongest boat belonging to any ship. It is principally employed to carry great burdens, as anchors, cables, ballast, &c. See BOAT.

LONGEVITY, length of life.

From the different longevities of men in the beginning of the world, after the flood, and in these ages, Mr Derham draws an argument, for the interposition of a divine Providence.

Immediately after the creation, when the world was to be peopled by one man and one woman, the ordinary age was 900 and upwards.—Immediately after the flood, when there were three persons to stock the world, their age was cut shorter, and none of those patriarchs, but Shem, arrived at 500.—In the second century we find none that reached 240: in the third, none but Terah that came to 200 years; the world, at least a part of it, by that time being so well peopled, that they had built cities, and were cantoned out into distant nations.—By degrees, as the number of people increased, their *longevity* dwindled, till it came down at length to 70 or 80 years: and there it stood, and has continued to stand ever since the time of Moses.—This is found a good medium, and by means hereof the world is neither overstocked, nor kept too thin; but life and death keep a pretty equal pace.

That the common duration of man's life has been the same in all ages since the world was peopled, is plain both from sacred and profane history. To pass by others, Plato lived to 81, and was accounted an old man: and the instances of *longevity* produced by Pliny, L. vii. c. 48. as very extraordinary, may most of them be matched in modern histories. Mr Carew (A) tells us, that there lived in his time, in Cornwall, one Polzew, who reached the age of 130; a kinsman of his lived to 112; one Mr

Longevity, Mr Beauchamp, to 106; and that there died in his own parish, in the short space of 14 weeks, four persons, whose years made together 340. The famous Thomas Par, who was born at Alderbury in Shropshire, lived to 152 years (b). In Oxfordshire, Dr Plott tells us of Richard Clifford, living, at Bolcott, to 114; Brian Stevens, at Woodstock, and two or three persons then living at Oxford, above 100 (c). Dr Willet informs us of a man who lived at Everden, in Bedfordshire, to the age of 124 (d). Dr Hakewill observes of William, marquis of Winchester, that he reached 107 (e). Dr Plott tells us, that Mr Biddulph, of Biddulph in Staffordshire, had 12 tenants living, whose ages, put together, made 1000 (f). Henry Jenkins, of Yorkshire, died at 168 (g). In Scotland also, some persons have attained to a very great ages. Buchanan mentions one, who at 140, was able to go out to fish, in a tempestuous sea, in his own little boat (h); and Mr Martin affirms, that one Tairville lived, in Shetland, to 180 (i). The countess of Desmond, in Ireland, who was known to Sir Walter Raleigh and Lord Bacon, lived to 140 (k).

No certain causes have hitherto been discovered which the longevity of mankind can always be attributed. Some have attributed it to temperance and a country life; but instances of longevity are as rare among people who live in this way as among others who live more freely, provided they go not to great excesses. It would seem therefore, that at the first formation of the human body, the original stamina in some are of such a nature as to be capable of continuing life for a much longer time than in others, even where circumstances are otherwise very much alike. Hence we may easily see how it becomes exceedingly difficult, or rather impossible, to lay down a rule by following of which he may expect to attain to long life;—a deficiency in the original stamina cannot be supplied by art, though temperance and sobriety are undoubtedly the best methods of avoiding any waste of that strength which nature has originally given, or of shortening our life by bringing on diseases. See ABSTINENCE.

LONGFORD, a county of Ireland, 25 miles in length, and 16 in breadth, bounded on the east and south by West-Meath, on the north and north-west by Leitrim and Cavan, and on the west by the river Shannon. It contains upwards of 5000 houses, 24 parishes, 6 baronies, 4 boroughs, and sends 10 members to parliament. It is a small, but rich and pleasant country, and the principal town is of the same name.

LONG-ISLAND, is an island of North America, in the colony of New-York, which is separated from the continent by a narrow channel; and is about 100 miles in length, and 12 in breadth, containing Queen's-county, Suffolk-county, and Richmond-county. There is a fine plain in the middle of the island, called *Salisbury-plain*, on which they have

horse-races; and gentlemen come to it from the neighbourhood parts, as those in England do to New-Market. The produce of this island is chiefly provisions for the mouth, such as wheat, Indian-corn, salt, beef, pork, fish, and strong-beer, which they send to the Caribbee Islands; and, in lieu of them, receive sugar, rum, cotton, and indigo.

LONGIMETRY, the art of measuring lengths, both accessible and inaccessible. See GEOMETRY and TRIGONOMETRY.

LONGING, is a preternatural appetite in pregnant women, and in some sick persons when about to recover. It is called *pica*, from the bird of that name, which is said to be subject to the same disorder. The disorder consists of both a desire of unusual things to eat and drink, and in being soon tired of one and wanting another. It is called *malacia*, from *μαλακω*, “weakness.” In pregnant women it is somewhat relieved by bleeding, and in about the fourth month of their pregnancy it leaves them. Chlorotic girls, and men who labour under suppressed hemorrhoids, are very subject to this complaint, and are relieved by promoting the respective evacuations. In general, whether this disorder is observed in pregnant women, in persons recovering from an acute fever, or in those who labour under obstructions of the natural evacuations, this craving of the appetite should be indulged.

LONGINICO, a town of Turkey in Europe, in the Morea, anciently called *Olympia*, famous for being the place where the Olympic games were celebrated, and for the temple of Jupiter Olympus, about a mile distant. It is now but a small place, seated on the river Alpheus, 10 miles from its mouth, and 50 fouth of Lepanto. E. Long. 22. o. N. Lat. 37. 30.

LONGINUS (Dionysius), a celebrated Greek critic of the third century, was probably an Athenian. His father's name is unknown, but by his mother he was allied to the celebrated Plutarch. His youth was spent in travelling with his parents, which gave him an opportunity to increase his knowledge, and improve his mind. After his travels he fixed his residence at Athens, and with the greatest assiduity applied to study. Here he published his Treatise on the Sublime; which raised his reputation to such a height, and gave the Athenians such an opinion of his judgment and taste, that they made him sovereign judge of all authors, and every thing was received and rejected by the public according to his decisions. He seems to have staid at Athens a long time; here he taught the academic philosophy, and among others had the famous Porphyry for his pupil. But it was at length his fortune to be drawn from Athens, and to mix in more active scenes; to train up young princes to virtue and glory; to guide the busy passions of the great to noble objects; to struggle for, and at last to die, in the cause of liberty. Zenobia, queen of the East, prevailed on him to undertake the education of her sons; and he soon gained an uncommon share in her esteem: she spent the vacant hours of her life in his conversation, and modelled her senti-

montanus.

sentiments and conduct by his instructions. That prince was at war with Aurelian; and being defeated by him near Antioch, was compelled to shut herself up in Palmyra, her capital city. The emperor wrote her a letter, in which he ordered her to surrender; to which she returned an answer, drawn up by Longinus, which filled him with resentment. The emperor laid siege to the city; and the Palmyrians were at length obliged to open their gates, and receive the conqueror. The queen and Longinus endeavoured to fly into Persia; but were unhappily overtaken and made prisoners when they were on the point of crossing the Euphrates. The queen, intimidated, weakly laid the blame of vindicating the liberty of her country on its true author; and the brave Longinus, to the disgrace of the conqueror, was carried away to immediate execution. The writings of Longinus were numerous, some on philosophical, but the greater part on critical subjects. Dr Pearce has collected the titles of 25 treatises, none of which, excepting that on the Sublime, have escaped the depredations of time and barbarians. On this imperfect piece the great fame of Longinus is raised, who, as Pope expresses it—"is himself the great sublime he draws." The best edition of his works is that by Tollerius, printed at Utrecht in 1694, *cum notis variorum*. It has been translated into English by Mr Smith.

LONGISSIMUS DORSI. See ANATOMY, *Table of the Muscles*.

LONGITUDE of a STAR, in astronomy, an arch of the ecliptic, intercepted between the beginning of Aries and the point of the ecliptic cut by the star's circle of longitude.

LONGITUDE of any place on the surface of the earth. See GEOGRAPHY, ASTRONOMY, and NAVIGATION. See also HARRISON.

*Method of finding the LONGITUDE at Sea.* See NAVIGATION.

LONGITUDINAL, in general, denotes something placed lengthwise; thus some of the fibres in the vessels of the human body are placed longitudinally, others transversely or acrois.

LONGOMONTANUS (Christian), a learned astronomer, born in a village of Denmark, in 1562. He was the son of a ploughman; and was obliged to suffer during his studies all the hardships to which he could be exposed, dividing his time, like the philosopher Cleantes, between the cultivation of the earth and the lessons he received from the minister of the place. At last, when he was 15, he stole away from his family, and went to Wiburg, where there was a college, in which he spent 11 years; and though he was obliged to earn a livelihood, he applied himself to study with such ardour, that among other sciences he learned the mathematics in great perfection. He afterwards went to Copenhagen; where the professors of that university in a short time conceived so high an opinion of him, that they recommended him to the celebrated Tycho Brahe. Longomontanus lived eight years with that famous astronomer, and was of great service to him in his observations and calculations. At length, being extremely desirous of obtaining a professor's chair in Denmark, Tycho Brahe consented, though with some difficulty, to deprive himself of his service; gave him a discharge, filled with the highest testimonies of his esteem; and furnished him with money for the

Longue-  
ville,  
Loniceræ.

expense of his long journey. He obtained a professorship of mathematics in the university of Copenhagen, in 1605; and discharged the duty of it worthily till his death, which happened in 1647. He wrote many learned works; amused himself with endeavouring to square the circle, and pretended that he had made that discovery; but Dr John Pell, an English mathematician, attacked him warmly on that subject, and proved that he was mistaken.

LONGUEVILLE, a town of France, in Upper Normandy, and in the territory of Caux, seated on the small river Lee, 17 miles north of Rouen. It has the title of a duchy. E. Long. 1. 10. N. Lat. 49. 46.

LONGWY, a town of France, on the frontiers of the duchy of Luxemburg, with a castle, divided into the old and new towns. This last was built and fortified by Lewis XIV. It is seated on an eminence. E. Long. 5. 51. N. Lat. 40. 32.

LONGUS, a Greek poet, author of a book, intitled *Ποιμένας*, or Pastorals, and a romance containing the loves of Daphnis and Chloe. Huetius, bishop of Avranches, speaks very advantageously of this work; but he confutes the obscene touches with which it is interperfed. None of the ancient authors mention him, so the time when he lived cannot be certainly fixed. There is an English translation of this author, which is ascribed to the late J. Craggs, Esq; secretary of state.

LONICERA, HONEYSUCKLE; a genus of the monogynia order, belonging to the pentandria class of plants.

*Species.* 1. The albigena, or upright red-berried honeysuckle, rises with a shrubby, short, thick, upright stem, branching strong and erectly four or five feet high; largely, spear-shaped leaves, in pairs opposite; and from the sides of the branches many red flowers by two's on long footstalks, each succeeded by two red berries joined together at their base; it flowers in August, and the berries ripen in autumn. 2. The cærulea, or blue-berried upright honeysuckle, rises with a shrubby upright stem, branching moderately three or four feet high, with many white flowers proceeding from the sides of the branches; appearing in May, and succeeded by blue berries joined together at their base. 3. The nigra, or black-berried upright honeysuckle, rises with a shrubby stem branching three or four feet high, with white flowers succeeded by single and distinct black-berries. 4. The tartarica, or Tartarian honeysuckle, rises with a shrubby upright stem, branching erectly three or four feet high; heart-shaped, opposite leaves, and whitish erect flowers succeeded by red berries, sometimes distinct, and sometimes double. 5. The diervilla, or yellow-flowered Acadian honeysuckle, rises with shrubby upright stalks, branching erect to the height of three or four feet; the branches terminated by clusters of pale yellow flowers, appearing in May and June, and sometimes continuing till autumn; but rarely ripening seeds here. 6. The xylum, or fly honeysuckle, rises with a strong shrubby stem, branching erect to the height of seven or eight feet; with erect white flowers proceeding from the sides of the branches; each succeeded by large double red berries, joined together at their base. The flowers appear in June, and the berries ripen in September. 7. The lymphoricarpa, or shrubby St Peter's-wort, rises with a shrubby, rough stem, branching erect four or five feet

Lonsdale,  
||  
Looking  
glass.

Loom.

high, with small greenish flowers appearing round the stalk in August. 8. The periclymenum, or common climbing honeysuckle, hath two principal varieties, viz. The English wild honeysuckle, or woodbine of our woods and hedges, and the Dutch or German honeysuckle. The former rises with shrubby, weak, very long slender stalks, and branches trailing on the ground, or climbing round any support; all terminated by oval imbricated heads, furnishing smallish flowers of white or red colours, and appearing from June or July till autumn. The Dutch honeysuckle rises with a shrubby declinated stalk, and long trailing purplish branches, terminated by oval imbricated heads, furnishing large beautiful red flowers of a fragrant odour, appearing in June and July. 9. The caprifolium, or Italian honeysuckle, rises with shrubby declinated stalks, sending out long slender trailing branches, terminated by verticillate or whorled bunches of clove-fitting flowers, very fragrant, and white, red, and yellow colours. 10. The sempervirens, or evergreen trumpet-flowered honeysuckle, rises with a shrubby declinated stalk, sending out long slender trailing branches, terminated by naked verticillate spikes, of long, unreflexed, deep scarlet flowers, very beautiful, but of little fragrance.

*Culture.* The most easy method of propagating these plants is by layers or cuttings, especially the latter; both of these readily emit roots, and form plants in one year fit for transplantation. Some sorts are also propagated by suckers and feed.

**LONSDALE**, or *Kirkby LONSDALE*, a town of Westmoreland, seated on the river Lon, in a pleasant and rich valley of the same name. It is a large well-built town, has a handsome church, and a fine stone-bridge over the river. It is well inhabited; and is the best town in the county, except Kendal. W. Long. 2. 27. N. Lat. 54. 10.

**LOO**, a town of the United Provinces, in Guelderland, eight miles west of Deventer, where the prince of Orange has a fine palace. E. Long. 6. o. N. Lat. 52. 18.

**LOOF**, the after part of a ship's bow; or that part of her side forward where the planks begin to be incurved into an arch as they approach the stem.

**LOOK-OUT**, in the sea-language, a watchful attention to some important object or event which is expected to arise from the present situation of a ship, &c. It is principally used in navigation when there is a probability of danger from the real or supposed proximity of land, rocks, enemies, and, in short, whatever peril he may encounter through inattention, which might otherwise have been avoided by a prudent and necessary vigilance.

There is always a look-out kept on a ship's fore-castle at sea, to watch for any dangerous objects lying near her track, and to which she makes a gradual approach as the advances: the mate of the watch accordingly calls often from the quarter-deck, "Look out afore there!" to the persons appointed for this service.

**LOOKING-GLASSES**, are nothing but plain mirrors of glass; which, being impervious to the light, reflect the images of things placed before them; for the theory whereof, see the articles **MIRROR** and **REFLECTION**.

For the casting, grinding, and polishing of looking-

glasses, see the article **GLASS**.

For foliating of looking-glasses. See the article **FOLIATING**.

**LOOM**, a frame composed of a variety of parts, used in all the branches of weaving; for a particular description of which, see the article **WEAVING**.

*Heir-LOOM*, in law, are such goods and personal chattels, as, contrary to the nature of chattels, shall go by special custom to the heir along with the inheritance, and not to the executor of the last proprietor. The termination, *loom*, is of Saxon original; in which language it signifies a limb or member; so that an heir-loom is nothing else but a limb or member of the inheritance. They are generally such things as cannot be taken away without damaging or dismembering the freehold: otherwise the general rule is, that no chattel-interest whatsoever shall go to the heir, notwithstanding it be expressly limited to a man and his heirs, but shall vest in the executor. But deer in a real authorized park, fishes in a pond, doves in a dove-house, &c. though in themselves personal chattels, yet they are so annexed to, and so necessary to the well-being of, the inheritance, that they shall accompany the land wherever it vests, by either descent or purchase. For this reason also the ancient jewels of the crown are held to be heir-looms; for they are necessary to maintain the state, and support the dignity, of the sovereign for the time being. Charters likewise, and deeds, court-rolls, and other evidences of the land, together with the chests in which they are contained, shall pass together with the land to the heir, in the nature of heir-looms, and shall not go to the executor. By special custom also, in some places, carriages, utensils, and other household implements, may be heir-looms; but such custom must be strictly proved. On the other hand, by almost general custom, whatever is strongly affixed to the freehold or inheritance, and cannot be severed from thence without violence or damage, *quod ad edibus non facile revellitur*, is become a member of the inheritance, and shall thereupon pass to the heir; as chimney-pieces, pumps, old fixed or dormant tables, benches, and the like. A very similar notion to which prevails in the duchy of Brabant; where they rank certain things moveable among those of the immovable kind, calling them by a very peculiar appellation, *prædia volantia*, or volatile estates: such as beds, tables, and other heavy implements of furniture, which (as an author of their own observes) *dignitatem istam nacta sunt, ut villis, sylvis, et adibus, aliisque prædiis, comparantur; quod solidiora mobilia ipsi adibus ex destinatione patrisfamilias coherere videantur, et pro parte ipsarum adium æstimantur*.

Other personal chattels there are, which also descend to the heir in the nature of heir-looms; as a monument or tomb-stone in a church, or the coat-armour of his ancestor there hung up, with the penons and other ensigns of honour suited to his degree. In this case, albeit the freehold of the church is in the parson, and these are annexed to that freehold, yet cannot the parson or any other take them away or deface them, but is liable to an action from the heir. Pews in the church are somewhat of the same nature, which may descend by custom immemo-

Comment.

rial

Looking  
Lophius.

rial (without any ecclesiastical concurrence) from the ancestor to the heir. But though the heir has a property in the monuments and effigies of his ancestors, yet he has none in their bodies or ashes; nor can he bring any civil action against such as indecently at least, if not impiously, violate and disturb their remains, when dead and buried. The parson indeed, who has the freehold of the soil, may bring an action of trespass against such as dig and disturb it: and, if any one in taking up a dead body steals the shroud or other apparel, it will be felony; for the property thereof remains in the executor, or whoever was at the charge of the funeral.

Heir-looms, though they be mere chattels, yet cannot be devised away from the heir by will; but such a devise is void, even by a tenant in fee-simple. For, though the owner might during his life have sold or disposed of them, as he might of the timber of the estate, since, as the inheritance was his own, he might mangle or dismember it as he pleased; yet, they being at his death instantly vested in the heir, the devise (which is subsequent, and not to take effect till after his death) shall be polliarded to the custom, whereby they have already descended.

LOOMING, in the sea-language, an indistinct appearance of any distant object, as the sea-coast, ships, mountains, &c. as, "the looms large before the wind;" "the looming of the land is high above the water, &c."

LOPES LE VEGA, See VEGA.

LOPHIUS, FISHING-FROG, *Toad-fish*, or *Sea-devil*; a genus of the branchiostegous order of fishes, whose head is in size equal to all the rest of the body. There are three species, the most remarkable of which is the piscatorius, or common fishing-frog, an inhabitant of the British seas. This singular fish was known to the ancients by the name of *Βατραχος*, and *Rana*; and to us by that of the *fishing-frog*, for it is of a figure resembling that animal in a tadpole state. Pliny takes notice of the artifice used by it to take its prey: *Eminientia sub oculis cornicula turbato limo erit, assultantes pisciculos attrahens, donec tam prope accedunt, ut affliat.* "It puts forth the slender horns it has beneath its eyes, enticing by that means the little fish to play round, till they come within reach, when it springs on them." The fishing-frog grows to a large size, some being between four and five feet in length; and Mr Pennant mentions one taken near Scarborough, whose mouth was a yard wide. The fishermen on that coast have a great regard for this fish, from a supposition that it is a great enemy to the dog-fish; and whenever they take it with their lines, set it at liberty.

It is a fish of very great deformity: the head is much bigger than the whole body; is round at the circumference, and flat above; the mouth of a prodigious wideness. The under jaw is much longer than the upper: the jaws are full of slender sharp teeth: in the roof of the mouth are two or three rows of the same: at the root of the tongue, opposite each other, are two bones of an elliptical form, thick set, with very strong sharp teeth. The nostrils do not appear externally, but in the upper part of the mouth are two large orifices that serve instead of them. On each side the upper jaw are two sharp

spines, and others are scattered about the upper part of the head. Immediately above the nose are two long tough filaments, and on the back three others; these are what Pliny calls *cornicula*, and says it makes use of to attract the little fish. They seem to be like lines flung out for that end. Along the edges of the head and body are a multitude of short fringed skins, placed at equal distances. The aperture to the gills is placed behind; each of these is very wide, so that some writers have imagined it to be a receptacle for the young in time of danger. The body grows slender near the tail, the end of which is quite even. The colour of the upper part of this fish is dusky, the lower part white; the skin smooth.

LORANTHUS, in botany, a genus of the monogynia order, belonging to the hexandria class of plants. There is only one species, a native of America, discovered by Father Plumier, and found growing naturally at La Vera Cruz by Dr Houlton. It rises with a shrubby stalk, eight, or 10 feet high, dividing into several branches, having at their ends clusters of small scarlet-coloured flowers, succeeded by oval berries with a pulpy covering, and a hard shell with one cell, inclosing several compressed seeds. It is propagated by seeds, which should be sown soon after they are ripe; otherwise they are very apt to miscarry, or lie a year in the ground without germinating. The plants require always to be kept in a bark-stove.

LORD, a title of honour given to those who are noble either by birth or creation. In this sense, it amounts to much the same as *peer of the realm*, or *lord of parliament*. The title is by courtesy also given to all the sons of dukes and marquises, and to the eldest sons of earls: and it is also a title of honour bestowed on those who are honourable by their employments; as *lord advocate*, *lord chamberlain*, *lord chancellor*, &c. The word is Saxon, but abbreviated from two syllables into one; for it was originally *Illaford*, which, by dropping the aspiration, became *Laford*, and afterwards, by contraction, *Lord*. "The etymology of the word (says J. Coates) is well worth observing: for it was composed of *illaf*, "a loaf of bread," and *ford*, "to give, or afford;" so that *Illaford*, now *Lord*, implies "a giver of bread;" because, in those ages, such great men kept extraordinary houses, and fed all the poor; for which reason they were called *givers of bread*, a thing now much out of date; great men being fond of retaining the title, but few regarding the practice for which it was first given. See *LADY*.

House of LORDS, one of the three estates of parliament, and composed of the Lords Spiritual and Temporal.

1. The *Spiritual Lords* consist of 2 archbishops, and 24 bishops; and, at the dissolution of monasteries by Henry VIII. consisted likewise of 26 mitred abbots, and two priors: a very considerable body, and in those times equal in number to the temporal nobility. All these hold, or are supposed to hold, certain ancient baronies under the king: for William the Conqueror thought proper to change the spiritual tenure of frank-almoign or free-alms, under which the bishops held their lands during the Saxon government, into the feudal or Norman tenure by barony; which subjected

Lords.

their estates to all civil charges and assessments, from which they were before exempt; and, in right of succession to those baronies, which were alienable from their respective dignities, the bishops and abbots were allowed their seats in the house of lords. But though these lords spiritual are in the eye of the law a distinct estate from the lords temporal, and are so distinguished in most of our acts of parliament; yet in practice they are usually blended together under the name of *the lords*; they intermix in their votes, and the majority of such intermixture joins both estates. And from this want of a separate assembly, and separate negative of the prelates, some writers have argued very cogently, that the lords spiritual and temporal are now in reality only one estate: which is unquestionably true in every effectual sense, though the ancient distinction between them still nominally continues. For if a bill should pass their house, there is no doubt of its validity, though every lord spiritual should vote against it; of which Selden and Sir Edward Coke give many instances: as, on the other hand, doubtless it would be equally good, if the lords temporal present were inferior to the bishops in number, and every one of those temporal lords gave his vote to reject the bill; though this Sir Edward Coke seems to doubt of.

2. The temporal lords consist of all the peers of the realm, (the bishops not being in strictness held to be such, but merely lords of parliament), by whatever title of nobility distinguished; dukes, marquises, earls, viscounts, or barons\*. Some of these fit by descent, as do all ancient peers; some by creation, as do all new-made ones; others, since the union with Scotland, by election, which is the case of the 16 peers, who represent the body of the Scots nobility. Their number is indefinite, and may be increased at will by the power of the crown: and once, in the reign of queen Anne, there was an instance of creating no less than 12 together; in contemplation of which, in the reign of king George I. a bill passed the house of lords, and was countenanced by the then ministry, for limiting the number of the peerage. This was thought by some to promise a great acquisition to the constitution, by restraining the prerogative from gaining the ascendant in that august assembly, by pouring in at pleasure an unlimited number of new-created lords. But the bill was ill relished, and miscarried in the house of commons, whose leading members were then desirous to keep the avenues to the other house as open and easy as possible.

The distinction of ranks and honours is necessary in every well-governed state: in order to reward such as are eminent for their services to the public, in a manner the most desirable to individuals, and yet without burthen to the community; exciting thereby an ambitious yet laudable ardour and generous emulation in others. And emulation, or virtuous ambition, is a spring of action which, however dangerous or invidious in a mere republic or under a despotic sway, will certainly be attended with good effects under a free monarchy; where, without destroying its existence, its excesses may be continually restrained by that superior power, from which all honour is derived. Such a spirit, when nationally diffused, gives life and vigour to the community; it sets all the wheels of government in motion, which, under a wise regulator, may be directed to any bene-

ficial purpose; and thereby every individual may be made subservient to the public good, while he principally means to promote his own particular views. A body of nobility is also more peculiarly necessary in our mixed and compounded constitution, in order to support the rights of both the crown and the people, by forming a barrier to withstand the encroachments of both. It creates and preserves that gradual scale of dignity, which proceeds from the peasant to the prince; rising like a pyramid from a broad foundation, and diminishing to a point as it rises. It is this ascending and contracting proportion that adds stability to any government; for when the departure is sudden from one extreme to another, we may pronounce that state to be precarious. The nobility therefore are the pillars, which are reared from among the people, more immediately to support the throne; and, if that falls, they must also be buried under its ruins. Accordingly, when in the last century the commons had determined to extirpate monarchy, they also voted the house of lords to be useless and dangerous. And since titles of nobility are thus expedient in the state, it is also expedient that their owners should form an independent and separate branch of the legislature. If they were confounded with the mass of the people, and like them had only a vote in electing representatives, their privileges would soon be borne down and overwhelmed by the popular torrent, which would effectually level all distinctions. It is therefore highly necessary that the body of nobles should have a distinct assembly, distinct deliberations, and distinct powers from the commons. See also KING, NOBILITY, PARLIAMENT, COMMONS, and COMMONALTY.

As to the peculiar laws and customs relating to the house of lords: One very ancient privilege is that declared by the charter of the forest, confirmed in parliament 9 Hen. III.; viz. that every lord spiritual or temporal summoned to parliament, and passing thro' the king's forests, may, both in going and returning, kill one or two of the king's deer without warrant; in view of the forester if he be present, or on blowing a horn if he be absent; that he may not seem to take the king's venison by stealth.

In the next place, they have a right to be attended, and constantly are, by the judges of the court of king's bench and common-pleas, and such of the barons of the exchequer as are of the degree of the coif, or have been made sergeants at law; as likewise by the king's learned counsel, being sergeants, and by the masters of the court of chancery; for their advice in point of law, and for the greater dignity of their proceedings. The secretaries of state, with the attorney and solicitor general, were also used to attend the house of peers, and have to this day (together with the judges, &c.) their regular writs of summons issued out at the beginning of every parliament, *ad tractandum et consilium impendendum*, though not *ad consentiendum*; but, whenever of late years they have been members of the house of commons, their attendance here hath fallen into disuse.

Another privilege is, that every peer, by licence obtained from the king, may make another lord of parliament his proxy, to vote for him in his absence: A privilege, which a member of the other house can

by

\* See Nobility.

**Loretto.** by no means have, as he is himself but a proxy for a multitude of other people.

Each peer has also a right, by leave of the house, when a vote passes contrary to his sentiments, to enter his dissent on the journals of the house, with the reasons for such dissent; which is usually styled his protest.

All bills likewise, that may in their consequences any way affect the rights of the peerage, are by the custom of parliament to have their first rise and beginning in the house of peers, and to suffer no changes or amendments in the house of commons.

There is also one statute peculiarly relative to the house of lords; 6 Ann. c. 23. which regulates the election of the 16 representative peers of North Britain, in consequence of the 22 and 23 articles of the union; and for that purpose prescribes the oaths, &c. to be taken by the electors; directs the mode of balloting; prohibits the peers electing from being attended in an unusual manner; and expressly provides, that no other matter shall be treated of in that assembly, save only the election, on pain of incurring a præmunire. See also the articles **NOBILITY** and **PEERS**.

**LORETTO**, a town of Italy, in the Marca or Marche of Ancona, with a bishop's see. It is small, but fortified; and contains the *casa santa*, or the house of Nazareth, in which they pretend Jesus Christ was brought up. They tell us, that it was carried by angels into Dalmatia, and thence to the place where it now stands. The inner part of this house or chapel is very old, but it is surrounded by a marble wall, and within a church built of free-stone. The famous lady of Loretto, who holds the infant Jesus in her arms, stands upon the principal altar: this statue is of cedar wood, three feet high; but her face can hardly be seen, on account of the smoke of the numerous lamps round about her. She is clothed with cloth of gold, set off with jewels; and the little Jesus is covered with a shirt. He holds a globe in his hand, and is adorned with rich jewels. There are prodigious numbers frequently go in pilgrimage to Loretto, particularly at Easter and Whitsuntide, among whom there are many of the first distinction. Every pilgrim, after having performed his devotion, makes the Virgin a present proportionable to his ability; whence it may be readily concluded, that this chapel must be full of immense riches.—Christina, queen of Sweden, made the Virgin a present of a crown of gold, worth above 100,000 crowns; and Isabella, infanta of Spain, sent her a garment which cost 40,000 ducats. Lewis XIII. of France, and his queen, sent her two crowns of gold, enriched with diamonds. Besides these crowns, they sent an angel of massy silver, holding in his hand the figure of the dauphin, of solid gold. The place where the governor resides stands near the church, and the ecclesiastics who are employed in it lodge in the same palace, where they receive the pilgrims of high distinction. As for the town itself, exclusive of the chapel, it is neither very considerable nor very agreeable; nor does it contain above 300 inhabitants, who are almost all shoemakers, taylor, or sellers of chaplets. The environs of this town are very agreeable, and in fine weather the high mountains of Croatia may be seen from hence. It is seated on a mountain, in E. Long. 13. 50. N. Lat. 43. 24.

**LORIMERS**, one of the companies of London, that make bits for bridles, spurs, and such like (small iron ware. They are mentioned in statute 1 Rich. II. c. 12.—The word seems derived from the Latin word *lorum*, a thong.

**LORME** (Philibert de), one of the most celebrated architects of the 16th century, was born at Lyons. Queen Catharine de Medicis gave him the superintendence of buildings; and he had the direction of those of the Louvre, the Tuilleries, the castle of St Anet, St Germain, and other edifices erected by her orders. He wrote several books of architecture, which are esteemed; and died about the year 1577.

**LORNE**, a division of Argyleshire in Scotland, which gives the title of marquis to the duke of Argyle. It extends above 30 miles in length from north to south, and about nine at its utmost breadth; bounded on the east by Braidalbin; on the west, by the islands; on the north, by Lochaber; and is divided from Knapdale on the south, by Loch Etive, on the banks of which stands the castle of Bergomarn, wherein the courts of justice were anciently held. This district, abounding with lakes, is the most pleasant and fertile part of Argyleshire, producing plenty of oats and barley. It once belonged to the ancient family of Mac Dougal, still residing on the spot; but devolved to the lords of Argyle, in consequence of a marriage with the heiress, at that time a branch of the Stuart family. The only place of note in this district is the castle of Dunstaffnage, or St Stephen's mountain, which formerly belonged to the kings of Scotland, some of whom are here interred: at present it is possessed by the duke of Argyle, and governed by an hereditary captain.

**LORRAIN**, a sovereign state of Europe, bounded on the north by Luxemburg and the archbishoprick of Treves, on the east by Alsace and the duchy of Deux Ponts, on the south by Franche Comté, and on the west by Champagne and the duchy of Bar. It is about 100 miles in length, and 75 in breadth; and abounds in all sorts of corn, wine, hemp, flax, rape-seed, game, and fish, with which it carries on some trade, and in general all the necessities of life. There are fine meadows and large forests, with mines of iron, silver, and copper, as also salt-pits. There are a great number of rivers; of which the principal are the Muele or Meuse, the Moselle, the Seille, the Meure, and the Sarre. It is divided into three parts; the duchy of Lorrain, properly so called, which was heretofore a sovereign state; the duchy of Bar, which formerly belonged to the dukes of Lorrain, but afterwards came under the government of France; and the third comprehends the three bishopricks of Metz, Toul, and Verdun, which have belonged to France ever since the year 1552. In 1733, the emperor of Germany being at war with France, this last got possession of the duchy of Lorrain; and when there was a peace made in 1735, it was agreed, that Stanislaus king of Poland, father-in-law to the king of France, should possess these duchies, and that after his death they should be united for ever to the crown of France. It was also then agreed, that Francis Stephen, duke of Lorrain, and the emperor's son-in-law, should have the grand duchy of Tuscany as an equivalent for Lorrain. After the death of the great duke of Tuscany, in 1737, king Sta-

Lothian.

Stanislaus and the duke of Lorrain took possession of their respective dominions, and the cessation was confirmed and guaranteed by a treaty in 1738. The inhabitants are laborious and valiant, and their religion is the Roman Catholic. They have but little trade with strangers, because they have no navigable rivers, and because they have all necessaries within themselves: but what little trade they have consists of corn and linen cloth. Nancy is the capital town.

LORRAIN (Robert le), an eminent sculptor, born at Paris in 1666. From his infancy, he made so rapid a progress in the art of designing, that at the age of 18 the celebrated Girardon intrusted him with the care of teaching his children and correcting his disciples. He committed to him also, in conjunction with Noulsson, the execution of the famous tomb of cardinal Richlieu in the Sorbonne, and his own tomb at St Landres in Paris. On his return from Rome, he finished several pieces at Marcilles, which had been left imperfect by the death of Mr Puget. He was received into the academy of Sculpture in 1701. His *chief d'œuvre* is Calatea, a work universally admired. Lorrain afterwards made a Bacchus for the gardens at Versailles, a Faun for those of Marly; and several bronzes, among which is an Andromeda; all in an excellent taste. This artist succeeded chiefly in heads; and more particularly in that of young girls, which he performed with incomparable delicacy and truth.

LORRAIN (Claude.) See CLAUD.

LOTEN (John), a good landscape-painter of the English school; though a native of Switzerland. His taste led him to solemn and dreary scenes, as landscapes accompanied with showers of rain, &c. and he seldom omitted to introduce oak-trees in his prospects: his landscapes are generally large, and he painted with nature, truth, and force. But the effect of his composition had been much greater if he had been less cold in his colouring: for the judicious eye is not pleased with the darkness that predominates in it.

LOTHIAN, a name given to three counties of Scotland, viz. Linlithgow-shire, Haddington-shire, and Edinburgh-shire. An account is given of Linlithgow shire, or west Lothian, under the article LINLITHGOW.

East-Lothian, or Haddington-shire, is bounded on the north by the Frith of Forth; on the south, by the hills of Lammermuir; and on the west, by the shire of Edinburgh or Mid Lothian. It is about 20 miles in length, and 12 in breadth; and is one of the most fruitful counties in Scotland, producing great quantities of wheat and all sorts of grain, well-watered, and plentifully supplied with fish, fowl, fuel, and all the necessaries of life. It abounds with towns, villages, and farms, interspersed with a great number of agreeable houses belonging to persons of rank and fortune. For cultivation, populousness, and fertility, this shire may vie with any tract of land in the island of Great Britain. Over and above the farming, which turns out to great account, the people towards the sea-coast employ themselves in the fishery, salt-making, and in foreign trade; and some of the more inland inhabitants engage in the linen and woollen manufactures. Lime-stone and coal are found in most parts of the country, and great numbers of sheep are fed on the hills of Lammermuir.

Edinburgh-shire, or Mid-Lothian, is 20 miles long, but varies in its breadth in different places from five to 16 miles. It is bounded on the east by East-Lothian; on the west, by the shire of Linlithgow; on the south, by Tweeddale; and on the north, by part of West-Lothian and the Frith of Forth. The aspect of the country is in general level and pleasant, interspersed with a few hills, that help to exhibit agreeable prospects. It is well watered with rivers, and shaded with woods. It produces plenty of coal, lime-stone, a soft black marble, and some copper ore. The soil, of itself fertile, is finely cultivated, and yields as plentiful harvests of excellent wheat as are found in any part of Great Britain. The whole shire is interspersed with noble houses and plantations belonging to noblemen and gentlemen of fortune. The farmers are master of the science of agriculture; and wealthy in consequence of their skill, some of them paying 500 l. of yearly rent. The country is well inhabited, and presents us with a good number of towns and populous villages. Along the sea-coast the common people subsist by fishing, and traffic in coals and salt, and some few carry on a smuggling commerce. Those in the inland are employed in farming, and some branches of the weaving manufacture. The sterility of this shire is in the gift of the crown; and Edinburgh is a county in itself.

Mid-Lothian is adorned with a great number of elegant houses, which we cannot pretend to particularize; among others, the houses of the earls of Morton and Lauderdale, about six miles to the westward of Edinburgh, two elegant edifices, surrounded with parks agreeably planted with a variety of trees; and at a little distance the house of New-Linton, a delightful seat, where the late earl of Stair resided during his honourable recess from courts and corruption. Nor is it deficient in Roman antiquities. At Cramond, upon the Frith, four miles to the westward of Edinburgh, we see the remains of a great Roman station, in the estate of Sir John Inglish. Here several Roman altars have been found, and stones having inscriptions dug up, together with a great quantity of Roman coins, brass, silver, and gold. Great part of these, and many other curious pieces of antiquity, were collected by the late Sir John Clerk of Pennycook, one of the barons of the exchequer, a gentleman of considerable fortune, eminent for his taste and learning, whose country-house at Mavis Bank, in this county, is one of the most agreeable villas in all Scotland.

LOTION, is, strictly speaking, such washing as concerns beautifying the skin, by cleansing it of those deformities which a disordered blood throws upon it. Medicines of this kind, however, are for the most part insignificant, and sometimes very dangerous; the only proper method of treating these disorders is, by administering such medicines as tend to correct the morbid state of the constitution from whence they arise.

LOTTERY, a kind of public game at hazard, frequent in Britain, France, and Holland, in order to raise money for the service of the state; being appointed with us by the authority of parliament, and managed by commissioners appointed by the lords of the treasury for that purpose. It consists of several numbers

Lothian  
Lottery.

Lottery.

numbers of blanks and prizes, which are drawn out of wheels, one of which contains the numbers, and the other the corresponding blanks or prizes.

The first English lottery we find mentioned in history, was drawn A. D. 1569. It consisted of 40,000 lots, at 10s. each lot: the prizes were plate; and the profits were to go towards repairing the havens of this kingdom. It was drawn at the west door of St Paul's cathedral. The drawing began on the 11th of January 1569, and continued incessantly drawing, *day and night*, till the 6th of May following; as Maitland, from Stowe, informs us in his History, Vol. I. p. 257. There were then only three lottery-offices in London. The proposals for this lottery were published in the years 1567 and 1568. It was at first intended to have been drawn at the house of Mr Dericke, her majesty's servant (*i. e.* her jeweller), but was afterwards drawn as above-mentioned.

Dr Rawlinson shewed the Antiquary Society, 1748, "A proposal for a very rich lottery, general without any blanks, containing a great number of good prizes, as well of redy money as of plate and certain sorts of merchandizes, having been valued and prised by the commandment of the queene's most excellent majestie's order, to the intent that such commodities as may chance to arise thereof after the charges borne may be converted towards the reparations of the havens and strength of the realme, and towards such other public good workes. The number of lots shall be foure hundred thousand, and no more; and every lott shall be the sum of tenne shillings sterling, and no more. To be filled by the feast of St Bartholomew. The shew of prizes are to be seen in Cheapside, at the sign of the Queene's Armes, the house of Mr Dericke, goldsmith, servant to the queene. Some other orders about it in 1567-8. Printed by Hen. Bynneman."

"In the year 1612, king James, in special favour for the present plantation of English colonies in Virginia, granted a lottery, to be held at the west end of St Paul's; whereof one Thomas Sharplys, a taylor of London, had the chief prize, which was 4000 crowns in fair plate." Baker's Chronicle.

In the reign of queen Anne, it was thought necessary to suppress lotteries, as nuisances to the public. Since that time, however, they have been licensed by an act of parliament. The following is an abstract of the last act for regulating Lottery-offices. It restrains any person from keeping an office for the sale of tickets, shares, or chances, or for buying, selling, insuring, or registering, without a licence; for which licence each office-keeper must pay 50l. to continue in force for one year, and the produce to be applied towards defraying the expences of the lottery. And no person is to be allowed to sell any share or chance less than a sixteenth, on the penalty of 50l. All tickets divided into shares or chances, are to be deposited in an office established in London by the commissioners of the treasury, who are to appoint a person to conduct the business thereof; and all shares are to be stamped by the said officer, who is to give a receipt for every ticket deposited with him. The numbers of all tickets so deposited are to be entered in a book, with the names of the owners, and the number of shares into which they are divided, and 2d. for each share is to be paid to the officer on depositing such tickets, who is

therewith to pay all expences incident to the office. All tickets deposited in the office to remain there three days after drawing. And any person keeping an office, or selling shares, or who shall publish any scheme for receiving moneys in consideration of any interest to be granted in any ticket in the said lottery, &c. without being in possession of such ticket, shall forfeit 500l. and suffer three months imprisonment. And no business is to be transacted at any of the offices after eight in the evening, except on the evening of the Saturday preceding the drawing. No person to keep any office for the sale of tickets, &c. in Oxford or Cambridge, on penalty of 20l.

LOTUS, in botany, a genus of the decandria order, belonging to the diadelphia class of plants. There are many species, but only five are usually cultivated in our gardens. 1. The tetragonolobus, or winged pea, hath trailing, slender, branchy stalks, about a foot long; garnished with trifoliate oval leaves; and, from the axillas of the branches, large, papilionaceous red flowers, one on each footstalk; succeeded by tetragonous solitary pods, having a membranous wing or lobe, running longitudinally at each corner. It flowers in June and July, and the seeds ripen in autumn. 2. The creticus, or Cretan silvery lotus, hath a slender under-shrubby stalk, rising by support three or four feet high, ornamented with trifoliate, bright silvery leaves; and branches terminated by several yellow flowers succeeded by subternate pods. 3. The Jacobæus, or lotus of St James's island, hath upright herbaceous stalks branching two or three feet high, and, from the upper part of the branches, long slender footstalks, terminated each by three or five yellowish purple flowers, appearing most part of the summer and autumn, and succeeded by subternate pods filled with plenty of seeds. 4. The hirsutus, or hairy Italian lotus, hath upright hairy stalks branching a yard high; and terminated by heads of whitish hoary-cupped flowers appearing in June, which are succeeded by oval pods full of seed, which ripens in autumn. 5. The dorycnium, or white Austrian lotus, hath undershrubby smooth stalks, branching three or four feet high, and the branches terminated by aplyllous heads of small white flowers appearing in June, succeeded by short pods.

Culture, &c. The first species is a hardy annual, and is easily raised from seed sown any time from the month of February to May; the plants requiring no other culture than to be kept free from weeds. It was formerly cultivated as an esculent; for its young green seed-pods may be dressed and eat like-pease, or in the manner of kidney-beans. The other species may be propagated either by seeds or cuttings, but require to be kept in pots in the green-house during the winter-season.

LOVAGE, in botany. See LIGUSTICUM.

LOVE. See MORALS, n° 144.

The symptoms produced by this passion are as follow: The eye-lids often twinkle; the eyes are hollow, and yet appear as if full with pleasure: the pulse is not peculiar to the passion, but the same with that which attends solicitude and care. When the object of this affection is thought of, particularly if the idea is sudden, the spirits are confounded, the pulse changes, and its force and time are very variable: in some instances, the person is sad and watchful; in others, the person,

Lotus  
||  
Love.

**Love-apple** not being conscious of his state, pines away, is slothful, and regardless of food; tho' the wiser, when they find themselves in love, seek pleasant company and active entertainments. As the force of love prevails, sighs grow deeper; a tremor affects the heart and pulse; the countenance is alternately pale and red; the voice is suppressed in the fauces; the eyes grow dim; cold sweats break out; sleep absents itself, at least until the morning; the secretions become disturbed; and a loss of appetite, a hectic fever, melancholy, or perhaps madness, if not death, constitutes the sad catastrophe. On this subject the curious may consult *Ægineta*, lib. iii. cap. 17. *Oribat. Synop.* lib. viii. cap. 9. or a treatise professedly written on love, as it is a distemper, by James Ferrard, Oxford, printed 1640.

**LOVE-Apple.** See **SOLANUM**.

**LOVENTINUM**, or **LUENTINUM**, (anc. geog.), a town of the Demeta in Britain, near the mouth of the Tuerobis or Tivy. Supposed to have been afterwards swallowed up by an earthquake, and to have stood where is now the lake called *Lin Savatan* in Brecknockshire.

**LOUIS**, or *Knights of St Louis*, the name of a military order in France, instituted by Lewis XIV. in 1693. Their colours are of a flame colour, and pass from left to right; the king is their grand-master. There are in it eight great crosses, and 24 commanders; the number of knights is not limited. At the time of their institution, the king charged his revenue with a fund of 300,000 livres for the pensions of the commanders and knights.

**LOUIS**, *Lewis*, *Louis d'or*, or *Lewidore*, a French coin, first struck in 1640, under the reign of Louis XIII. and which has now a considerable currency. See **MONEY-Table**.

**LOUISIANA**, a country in North America, bounded on the south by the gulph of Mexico, on the east by the river Mississippi, on the west by New Mexico, and on the north by an unknown country. It extends from the 29th to the 40th degree of north latitude, and from about the 80th to the 96th or 97th degree west longitude from London. The climate of Louisiana varies according to the latitudes. The southern parts are not so hot as those parts of Africa which lie under the same parallel, and the northern parts are colder than the countries of Europe at the same distance from the pole: the causes of which are supposed to be the thick forests which over-run the country, and the great number of rivers; the former preventing the sun from heating the earth, and the latter supplying it with moist vapours; besides the cold winds which come from the north over vast tracts of land. They have bad weather; but it never lasts long, for the rain generally falls in storms and sudden showers; the air is wholesome, the inhabitants healthy, and they who are temperate live to a great old age. The country is extremely well watered; and almost all the rivers that run through it fall into the Mississippi, which discharges itself into the gulph of Florida.

**LOUSE**, in zoology. See **PEDICULUS** and **LICE**.

**LOUSY DISEASE.** See **PHTHIRIASIS**.

**LOUTH**, a county in the eastern part of Ireland, which extends in the form of a bow or half-moon, on the side of the ocean, being much longer than it is broad; it is bounded on the south and south-west by

the county of East-Loath, on the north-west by Monaghan, on the north by Armagh, and on the north-east by the bay of Carlingford, which parts it from the county of Down; it is watered by several small rivers which fall into the sea, and its south frontiers are watered by the river Boyne, which renders it fruitful and rich. The most considerable places are Drogheda, Ardes, Dundalk, and Carlingford.

**LOUVAIN**, a city in the Austrian Netherlands, in the province of Brabant, pleasantly seated on the river Dyle, in a plentiful and agreeable country. The walls are about eight or nine miles in circumference; but they include several fields and vineyards. The castle stands on a high hill, surrounded with fine gardens, and has a charming prospect all over the country. This town contains nine market-places, 14 water-mills, 126 streets, 16 stone bridges, and several handsome palaces. The town-house is a venerable old building, adorned with statues on the outside; and the churches are very handsome, particularly the collegiate church of St Peter: but the principal ornament is the university, there being 60 colleges, which have two courts each; the students in divinity constantly wear gowns and caps, but the rest only at public exercises. The English have a nunnery here, which is reckoned the best in the Netherlands. This town was taken in the year 1746, by the French. *E. Long.* 4. 40. *N. Lat.* 51. 12.

**LOW-BELL**, in birding, a name given to a bell, by means of which they take birds in the night, in open champaign countries, and among stubble, in October. The method is to go out about nine o'clock at night in a still evening, when the air is mild, and the sun does not shine. The low-bell should be of a deep and hollow sound, and of such a size that a man may conveniently carry it in one hand. The person who carries it is to make it toll all the way he goes, as nearly as may be, in that manner in which the bell on the neck of a sheep tolls as it goes on and feeds. There must also be a box made like a large lantern, about a foot square, and lined with tin, but with one side open. Two or three great lights are to be set in this; and the box is to be fixed to the person's breast, with the open side forwards, so that the light may be cast forward to a great distance. It will spread as it goes out of the box; and will distinctly shew to the person that carries it whatever there is in the large space of ground over which it extends, and consequently all the birds that roost upon the ground. Two persons must follow him who carries the box and bell, one on each side, so as not to be within the reach of the light to shew themselves. Each of these is to have a hand-net of about three or four feet square, fastened to a long stick or pole; and on whichever side any bird is seen at roost, the person who is nearest is to lay his net over it, and take it with as little noise as possible. When the net is over the bird, the person who laid it is not to be in a hurry to take the bird, but must stay till he who carries the light is got beyond it, that the motions may not be discovered. The blaze of the light and the noise of the bell terrify and amaze the birds in such a manner that they remain still to be taken; but the people who are about the work must keep the greatest quiet and stillness that may be.

Some people are fond of going on this scheme alone. The person then fixes the light-box to his breast,

breast and carries the bell in one hand and the net in the other; the net in this case may be somewhat smaller, and the handle shorter. When more than one are out at a time, it is always proper to carry a gun; as it is no uncommon thing to spy a hare when on this expedition.

LOWER (Richard) an eminent English physician in the 17th century, was born in Cornwall, and educated at Westminster-school and Oxford. He entered on the physic-line; and practised under Dr Thomas Willis, whom he instructed in some parts of anatomy, especially when the latter was writing his *Cerebri anatome*. He, with Dr Willis, in 1674, discovered the medicinal waters at Ashop in Northamptonshire; which, upon their recommendations, became very much frequented. In 1666, he followed Dr Willis to London; practised physic under him; and became fellow of the royal society, and of the college of physicians. In 1669, he published his *Traictatus de corde*; and, after the death of Dr Willis in 1675, he was esteemed the most eminent physician in London. Upon the breaking out of the Popish plot in 1678, says Mr Wood in his *Athene Oxoniensis*, he closed with the Whigs, supposing that party would carry all before them; but, being mistaken, he lost his credit and practice. He died in 1691.

LOWERING, among distillers, a term used to express the debasing the strength of any spirituous liquor, by mixing water with it. The standard and marketable price of these liquors is fixed in regard to a certain strength in them called *proof*; this is that strength which makes them when shook in a vial, or poured from on high into a glass, retains a froth or crown of bubbles for some time. In this state, spirits consist of about half pure or totally inflammable spirit, and half water; and if any foreign or home spirits are to be exposed to sale, and are found to have that proof wanting, scarce any body will buy it till it has been distilled again and brought to that strength; and if it is above that strength, the proprietor usually adds water to it to bring it down to that standard. See the article *PROOF*.

There is another kind of lowering among the retailers of spirituous liquors to the vulgar, by reducing it under the standard-proof. Whoever has the art of doing this without destroying the bubble-proof, which is easily done by means of some addition that gives a greater tenacity to the parts of the spirits, will deceive all that judge by this proof alone. In this case, the best way to judge of liquors is by the eye and tongue, and especially by the instrument called *HYDROMETER*.

LOWTH (William), a learned divine, was the son of an apothecary born at London in 1661, and took his degrees at Oxford. His eminent worth and learning recommended him to Dr Mew bishop of Winchester, who made him his chaplain, gave him two livings in Hampshire, and conferred on him a prebend in the cathedral of Winchester. He acquired an unusual share of critical learning; but the most valuable part of his character was that which was least conspicuous to the world; that of a pious, diligent, and hospitable parish-priest. He published, &c. A vindication of the divine authority and inspiration

of the Old and New Testament. 2. Directions for the profitable reading of the Holy Scripture. 3. Commentaries on the prophets; and other works.

LOXIA, in zoology, the name of a genus of birds of the order of passerles: the distinguishing characters of which are, that the tongue is plain, equal, and whole; the beak large, thick, and short, crooked and convex both ways. There are 48 species, principally distinguished by the colour. The following are natives or visitors of Britain.

1. The coccythraustes, or haw-grosbeak, visits us only at uncertain times, and is not regularly migrant. They feed on berries; and even on kernels of the strongest stones, such as those of cherries and almonds, which they crack with the greatest facility: their bills are well adapted to that work, being remarkably thick and strong. Mr Willughby tells us, they are common in Germany and Italy; that in the summer they live in woods, and breed in hollow trees, laying five or six eggs; but in the winter they come down into the plains. The length of this species is seven inches; the breadth, 13: the bill is of a funnel shape; strong, thick, and of a dull pale pink colour; the breast and whole under-side is of a dirty flesh colour; the neck ash-coloured; the back and coverts of the wings of a deep brown, those of the tail of a yellowish bay: the greater quill-feathers are black, marked with white on their inner webs. The tail is short, spotted with white on the inner sides. The legs flesh-colour. The great particularity of this bird, is the form of the ends of the middle quill-feathers; which Mr Edwards justly compares to the figure of some of the ancient battle-axes: these feathers are glossed over with a rich blue; but are less conspicuous in the female.

2. The enucleator, or pine-grosbeak, is common to Hudson's Bay, Sweden, and Scotland. Mr Pennant observed them flying above the great pine-forests of Invercauld in Aberdeenshire, and imagines they breed there. They feed on the seeds of the pine. Linnæus says, they sing in the night. It is near twice the size of the bulbul. The bill is strong, dusky, forked at the end; less thick than that of the common bulfinch: head, back, neck, and breast, of a rich crimson: the bottoms of the feathers ash-colour: the quill-feathers and tail dusky; their exterior edges, of a dirty white; legs black: length, nine inches and a half. There seems an agreement in colours, as well as food, between this species and the cross-bill.

3. The curvirostra, or cross-bill. There are two varieties of this bird: Mr Edwards has very accurately figured the lesser, which is seen frequently; the other is very rare. These birds, like the former, are incessant visitants of this island: in Germany and Switzerland, they inhabit the pine forest, and breed in those trees as early as the months of January and February. They feed on the seeds of the cones of pines and firs; and are very dexterous in scaling them, for which purpose the structure of the lower mandible of their bill is admirably adapted: they feed also on hemp-seed, and the pips or kernels of apples, and are said to divide an apple with one stroke of the bill to get at the contents. Linnæus says, that the upper mandible of this bird is moveable; but, on examination, Mr Pennant could not discover its structure to

differ from that of others of the genus. These birds change their colours, or rather the shades of the colours: that is, the males which are red, vary at certain seasons to deep red, to orange, or to a sort of a yellow; the females, which are green, alter to different varieties of the same colour.

4. The pyrrhula, or bullfinch. The wild note of this bird is not in the least musical; but when tamed it becomes remarkably docile, and may be taught any tune after a pipe, or to whistle any notes in the justest manner: it seldom forgets what it has learned; and will become so tame as to come at call, perch on its master's shoulders, and (at command) go through a difficult musical lesson. They may be taught to speak, and some thus instructed are annually brought to London from Germany.—The male is distinguished from the female by the superior blackness of its crown, and by the rich crimson that adorns the cheeks, breast, belly, and throat of the male; those of the female being of a dirty colour: the bill is black, short, and very thick: the head large: the hind part of the neck and the back are grey: the coverts of the wings are black; the lower crossed with a white line: the quill-feathers dusky, but part of their inner webs white: the coverts of the tail and the vent-feathers white: the tail black.

In the spring these birds frequent our gardens; and are very destructive to our fruit-trees, by eating the tender buds. They breed about the latter end of May, or beginning of June, and are seldom seen at that time near houses, as they choose some very retired place to breed in. They are sometimes wholly black; and there are instances of their changing to this colour after they were full grown, and of recovering their natural colour in another year. Birds fed on hempseed alone are most apt to change their colour in this manner.

LOYOLA (Ignatius). See IGNATIUS.

LOZENGE, in heraldry; a four-cornered figure, resembling a pane of glass in old casements. See HERALDRY, p. 3597, col. 1. Tho' all heralds agree, that single ladies are to place their arms on lozenges, yet they differ with respect to the causes that gave rise to it. Plutarch says, in the life of Theseus, that in Megara, an ancient town of Greece, the tomb-stones, under which the bodies of the Amazons lay, were shaped after that form; which some conjecture to be the cause why ladies have their arms on lozenges. *S. Petra Sancta* will have this shield to represent a cushion, whereupon women used to sit and spin, or do other housewifery. Sir J. Ferne thinks it is formed from the shield called *tesfera*, which the Romans finding unfit for war, did allow to women to place their ensigns upon, with one of its angles always uppermost.

LOZENGES, among jewellers, are common to brilliant and rose diamonds. In brilliants, they are formed by the meeting of the skill and star facets on the bezil; in the latter, by the meeting of the facets in the horizontal ribs of the crown. See FACETS.

LUBEC, a city and port-town of Germany, in the circle of Lower Saxony and duchy of Holstein, in E. Long. 10. 35. N. Lat. 54. 20. It stands at the conflux of several rivers, the largest of which is the Trave, 12 miles from the Baltic, where it has a fine

harbour, and 40 north-east of Hamburg. By the Seeckenitz, another of those rivers, it has a communication with the Elbe, and consequently with the German ocean. The city lies on the side of a hill, with the Trave, increased by the Seeckenitz on the one side, and the Wackenitz on the other; and is strongly fortified with bastions, moats, walls, and ramparts; the last of which are planted with trees, and form an agreeable walk. Lubec being formerly the chief of the Hanse towns, was very powerful, in consequence of the vast trade it carried on; but a great part of that trade is now transferred to Hamburg: however, it is still said to employ 150 of its own ships, and has a great share of the Baltic trade. It is about two miles in length, and more than one in breadth. The houses are all of stone, but old-fashioned. Several of the streets have on each side rows of lime-trees, with canals in the middle, like those of Holland. The public structures consist of the ancient cathedral of the bishopric of Lubec, and several other Lutheran churches; a nunnery for 22 ladies, with an abbess and prioress; a poor-house, an alms-house, and house of correction; an orphan-house; an hospital dedicated to the Holy Ghost; a house in which poor travellers are entertained three days, and then sent forward with a pass; but such as happen to be sick, are provided with all necessaries, till they recover or die; the city-armoury, a grammar-school of seven classes, the Calvinist church, and the Popish chapel. The deputies of the Hanse-towns used to meet here formerly in the town-house. An alliance still subsists between Lubec, Hamburg, and Bremen; and these cities, under the name of *Hanse-towns*, negotiate treaties with foreign powers. Here are divers manufactures, and the city's territory is about 60 miles in compass. In the diet of the empire Lubec is possessed of the third seat among the Rhenish imperial cities; and among those of the circle, has the first. In the matricula, its assessment is 480 florins, and to the chamber of Wetzlar it pays 557 rix-dollars and 88 kruitzers. The city is a republic within itself, and both makes and executes laws in regard to civil and criminal matters, &c. A father and son, or two brothers, cannot be in the regency at the same time. The famous league of the Hanse-towns was begun here in 1164. This city had its charter of privileges from the emperor Frederic II. Formerly it carried on wars, both offensive and defensive, for several years, not only against the dukes of Mecklenburg, but against the kings of Sweden and Denmark; particularly in 1428, when it fitted out 250 ships of force against Eric X. king of Denmark. There are about 20 churches in Lubec, with lofty steeples or spires. The Trave brings ships of burden into the very heart of the city; but the largest unload at Travemunde, i. e. the mouth of the Trave, eight or ten miles distant. Formerly it is said to have employed no less than 600 ships. In the famous cellar here, it is said there is wine 200 years old. The church of St Mary's, a noble lofty pile, is supported by tall pillars, all of one stone each, and has a high spire, covered with gilt lead. The town's garrison consists of about 700 or 800 men. The revenue of its Lutheran bishop, though he is a prince of the empire, is said not to exceed 3000 pounds.

Luben  
||  
Lucar.

**LUBEN**, a city of Germany, in the marquisate of Lower Lusatia. It is situated on the river Spree, and is the capital of a small circle of the same name. It is the seat of the diets, and of the chief tribunals and offices; and has several churches, with a noble land-house and hospital. E. Long. 14. 25. N. Lat. 52. 0.

**LUBIENIETSKI** (Stanislaus), a Popish gentleman, descended from a noble family, and born at Cracow in 1623, was educated by his father with great attention. He became a celebrated Socinian minister; and took great pains to obtain a toleration from the German princes for his Socinian brethren. His labours, however, were ineffectual; being himself persecuted by the Lutheran ministers, and banished from place to place; until at length he was banished out of the world, with his two daughters, by poison, his wife narrowly escaping, in 1675. We have of his writing, *A history of the reformation in Poland; A treatise on comets*; with other works in Latin.

**LUBIN** (Eilhard), was professor of poetry in the university of Rostock, in 1595; and ten years after, was promoted to the professorship of divinity. He wrote notes on Anacreon, Juvenal, Persius, &c. and several other works; but that which made the most noise is a Treatise on the nature and origin of evil, intitled, *Phosphorus de causa prima et natura mali*, printed at Rostock in 1596; in which we have a curious hypothesis to account for the origin of moral evil. He supposed two co-eternal principles; not *matter* and *vacuum*, as Epicurus did; but God, and *Nothing*. This being published against by Grawer, was defended by Lubin; but after all, he is deemed better acquainted with polite literature than with divinity. He died in 1621.

**LUBLIN**, a handsome and considerable town of Poland, capital of the palatinate of the same name, with a citadel, a bishop's see, an university, and a handsome Jewish synagogue. Here the judicial courts for all Poland are held. It has three fairs, frequented by merchants from all nations. It is seated on the river Bystrza. E. Lon. 22. 31. N. Lat. 51. 26.

**LUCANUS** (Marcus Annæus), a Latin poet, born at Corduba in Spain, about A. C. 39. He was the son of Annæus Mela, brother to Seneca, and of Acilia, daughter of Lucanus a very famous orator. When he was scarcely 14 years of age, he declaimed with applause, both in Greek and Latin; and became the rival of Persius. Nero, charmed with his wit, made him augur and questor before the due age; but at last Nero disparaging his verses, he was so offended at it, that he engaged himself in Piso's conspiracy; for which he had his veins cut, as his uncle Seneca had before him, A. C. 65. He wrote several poems; but we have none remaining beside his *Pharsalia*, of which an excellent English version has been given by Mr Nicholas Rowe.

**LUCAR DE BARRAMEDA** (St.), an handsome and considerable town of Spain, with a very good harbour, well defended, in Andalusia. It was once the greatest port in Spain, before the galleons unloaded their treasure at Cadiz. It is seated at the mouth of the river Guadalquivir. W. Long. 6. 5. N. Lat. 36. 40.

**LUCAR de Guadiana** (St.), a strong town of Spain,

in Andalusia, on the confines of Algarve; seated on the river Guadiana, with a little harbour. W. Long. 5. 50. N. Lat. 37. 32.

**LUCAR la Mayor** (St.), a small town of Spain, in Andalusia, with the title of a duchy. It is seated on the river Guadiana, in W. Long. 6. 32. N. Lat. 37. 21.

**LUCAS** (Van Leyden), an excellent painter and engraver, was thus named from the place of his birth, he being born in Leyden in 1494. He was at first a disciple of his father, a painter of some eminence, and afterwards of Cornelius Engelbert; and was greatly admired in the Netherlands for his skill in painting and engraving. He took much pains with his works, and was a great emulator of Albert Durer; with whom he at length became so intimate, that they drew each other's picture: and indeed their style and manner have in all respects so close a resemblance, that it seems as if they had been both animated with the same soul. He lived and dressed with great magnificence; and died in the year 1533.

**LUCAS** (Richard), D. D. a learned English divine, was born in 1648, and studied at Oxford; after which he entered into holy orders, and was for some time master of the free school at Abergavenny. Being esteemed an excellent preacher, he became vicar of St Stephen's, Coleman-street, in London, and lecturer of St Olave's, in Southwark. He was doctor of divinity; and in 1696, was installed prebendary of Westminster. His sight began to fail him in his youth; but he totally lost it in his middle age. He was greatly esteemed for his piety and learning; and published several works, particularly, 1. *Practical Christianity*. 2. *An inquiry after happiness*. 3. *Several sermons*. 4. *A Latin translation of the whole duty of man*. He died in 1715.

**LUCCA**, a small republic of Italy on the coast of the Mediterranean, between the territory of Genoa on the west, Modena on the north, and Tuscany on the east. According to Keyser, it is only about 30 miles in circumference, but is exceedingly fertile and populous. It contains, besides the city of Lucca, 15 ovillages. The number of inhabitants are computed at 120,000. The government is lodged in a gonfalonier, whose power is much the same with that of the doges of Venice and Genoa. He is assisted by nine counsellors; but the power of all the ten continues only for two months; during which time they live in the state-palace, and at the public expence. They are chosen out of the great council, which consists of 240 nobles; but even this council is changed by a new election every two years. The revenues of the republic are about 400,000 scudi or crowns; out of which they maintain 500 men by way of regular force, and 70 Swifs as a guard to their acting magistrates. The city of Lucca is situated in a plain, terminating in most delightful eminences, adorned with villas, summer houses, corn-fields, and plantations of every kind; so that nothing either for use or pleasure is here wanting. The city, which is about three Italian miles in circumference, has regular well lined fortifications; and its streets, though irregular, are wide, well paved, and full of handsome houses. The number of its inhabitants are computed to be above 40,000; and they carry on large manufactures, especially of silk-stuffs. Lucca has a bishop, who enjoys several extraordinary pri-

Lucar  
||  
Lucca.

Luceria  
St Lucia.

privileges; and its cathedral is Gothic. The city stands in E. Long. 11. 27. N. Lat. 43. 52.

LUCERIA, (anc. geog.), a town of Apulia in Italy; which in Strabo's time still exhibited marks of Diomed's sovereignty in those parts. Ptolemy has *Nuceria*; whether from milkake, or the custom of his time, uncertain. Now *Nocera de Pagani*, in the kingdom of Naples. E. Long. 15. 0. N. Lat. 40. 40.

LUCERNE, in botany. See MEDICAGO. For the culture of this plant, see AGRICULTURE, n° 137.

LUCIA (St), one of the Caribbee Islands in the West-Indies, about 22 miles long, and 11 broad, the middle of it lying in N. Lat. 39. 14. W. Long. 27. 0. It was first settled by the French in 1650; but was reduced by the English in 1664, who evacuated it in 1666. The French immediately re-settled the island, but were again driven away by the Caribbs. As soon as the savages were gone, the former inhabitants returned, but only for a short time; for being afraid of falling a prey to the first privateer that should visit their coasts, they removed either to other French settlements that were stronger, or which they might expect to be better defended. There was then no regular culture or colony at St Lucia; it was only frequented by the inhabitants of Martinico, who came thither to cut wood, and to build canoes, and who had no considerable docks on the island. In 1718 it was again settled by the French; but four years after, it was given by the court of London to the duke of Montagu, who was sent to take possession of it. This occasioned some disturbance between the two courts; which was settled, however, by an agreement made in 1731, that, till the respective claims should be finally adjusted, the island should be evacuated by both nations, but that both should wood and water there. This precarious agreement furnished an opportunity for private interest to exert itself. The English no longer molested the French in their habitations; but employed them as their assistants in carrying on with richer colonies a smuggling trade, which the subjects of both governments thought equally advantageous to them. This trade has been more or less considerable till the treaty of 1763, when the property of St Lucia was secured to the crown of France. After that time the colony flourished considerably. In the beginning of the year 1772, the number of white people amounted to 2018 souls, men, women, and children; that of the blacks to 663 freemen, and 12,795 slaves. The cattle consisted of 928 mules or horses, 2070 head of horned cattle, and 3184 sheep or goats. There were 38 sugar-plantations, which occupied 978 pieces of land; 5,395,889 coffee-trees; 1,321,600 cocoa plants; and 367 plots of cotton. There were 706 dwelling places. The annual revenue at that time was about 175,000*l.* which, according to the abbé Raynal, must have increased one-eighth yearly for some time. It was taken by the British fleet under admirals Byron and Barrington, in the year 1778.

The soil of St Lucia is tolerably good, even at the sea-side; and is much better the farther one advances into the country. The whole of it is capable of cultivation, except some high and craggy mountains which bear evident marks of old volcanoes. In one deep

valley there are still eight or ten ponds, the water of which boils up in a dreadful manner, and retains some of its heat at the distance of 6000 toises from its reservoirs. The air in the inland parts, like that of all other uninhabited countries, is foul and unwholesome; but grows less noxious as the woods are cleared and the ground laid open. On some parts of the sea-coast, the air is still more unhealthy, on account of some small rivers which spring from the foot of the mountains, and have not sufficient slope to wash down the sands with which the influx of the ocean flows up their mouths, by which means they spread themselves into unwholesome marshes on the neighbouring grounds.

LUCIA (St), a high and mountainous island of Africa, and one of those of Cape Verde, is about nine leagues long, and lies in the latitude of 16° 18' N. according to the English geographers; but according to all others, it is a degree farther to the northward. On the east-fourth-east side is a harbour, with a bottom and shore of white sand; but its best road is opposite to St Vincents to the south-west, where there are at least 20 fathoms of water. On the west side there is no water: it abounds with goats, sea and land fowl, tortoises, &c. but whether it hath any inhabitants is not certainly known.

LUCIAN, a celebrated Greek author in the first century, was born at Samosata, of obscure parents, in the reign of the emperor Trajan. He studied law, and practised some time as an advocate; but growing weary of the wrangling oratory of the bar, he commenced rhetorician. He lived to the time of Marcus Aurelius, who made him regiller of Alexandria in Egypt; and, according to Suidas, he was at last worried by dogs. Lucian was one of the finest wits in all antiquity. His *Dialogues*, and other works, are written in Greek. In these he has joined the useful to the agreeable, instruction to satire, and erudition to elegance; and we every-where meet with that fine and delicate raillery which characterises the Attic taste.—Those who censure him as an impious scoffer at religion, have reason on their side, if religion consisted in the theology of the Pagan poets, or in the extravagant opinions of philosophers; for he perpetually throws such ridicule on the gods and philosophers, with their vices, as inspires hatred and contempt for them; but it cannot be said that he writes any-where against an over-ruling providence.

LUCIFER, according to the poets, was the son of Jupiter and Aurora: in astronomy, Lucifer is the bright planet Venus, which either goes before the sun in the morning, and is our morning-star; or in the evening follows the sun, and then is called *Hesperus*, or the evening-star.

LUCILIUS (Caius), a Roman knight, and a Latin poet, was born at Suessa in Italy, about 140 B. C. He served under Scipio Africanus in the war with the Numantines; and was in great favour with that celebrated general, and with Lælius. He wrote 30 books of satires, in which he lashed several persons of quality very sharply. Some learned men ascribe the invention of satire to him; but M. Dacier has maintained, with great probability, that Lucilius only gave a better turn to that kind of poetry, and wrote it with more wit and humour than his predecessors Ennius and Pa-

crivius

Lucilius.

Lucina  
||  
Lucullus.

cuvius had done. His fragments have been carefully collected by Francis Douza at Leyden in 1599, with notes. But they require still to be better illustrated by some learned critic.

LUCINA, a goddess among the Romans, who presided over women in labour. Some take her to be Diana, others Juno. She is called *Lucina*, because she brought children to the light; from the Latin word *lux*, "light."

LUCIUS, in ichthyology. See *ESOX*.

LUCONIA. See *MANILA*.

LUCOPHEREA, in ichthyology. See *PERCA*.

LUCRETIA, the famous Roman matron, wife of Collatinus, and the cause of the revolution in Rome from a monarchy to a republic: this lady being ravished by Sextus, the eldest son of Tarquin king of Rome, stabbed herself, 509 B. C. The bloody point, with her dead body exposed to the senate, was the signal of Roman liberty; the expulsion of the Tarquins, and abolition of the regal dignity, was instantly resolved on, and carried into execution.

LUCRETIVS, or TITUS LUCRETIVS CAIUS, one of the most celebrated of the Latin poets, was born of an ancient and noble Roman family, and studied at Athens, where he became one of Epicurus's sect. He acquired great reputation by his learning and eloquence; but in the flower of his age fell into a frenzy, occasioned by a philtre given him by his wife, who was distractedly fond of him. Lucretius, during the intervals of his madness, put Epicurus's doctrines into verse, and composed his six books *De rerum natura*, which are still extant. It is said that he killed himself in a fit of madness, in the 54th year before the Christian era, when 51 years old. The most correct edition of Lucretius is that of Simon de Coline. The cardinal de Polignac has refuted Lucretius's arguments in his excellent Latin poem intitled *Anti-Lucretius*. His poem *De rerum natura* has been translated into English by Mr Creech.

LUCRINUS LACUS (anc. geogr.), a lake of Campania between Baiz and Puteoli, famous for its waters, (Horace, Martial, Juvenal); *Lucrinenses* (Cicero), the people dwelling on it. Now a perfect bay since the earthquake in 1538.

LUCULLUS (Lucius Licinius), a Roman general, celebrated for his eloquence, his victories, and his riches. In his youth, he made a figure at the bar; and being afterwards made quaestor in Asia, and praetor in Africa, governed those provinces with great moderation and justice. Scarce he was known as a military man, when he twice beat the fleet of Amilcar, and gained two great victories over him. His happy genius was greatly improved by study; for he employed his leisure in reading the best authors on military affairs. Being made consul with Anicius Cotta, during the third war with Mithridates king of Pontus, he was sent against this prince: and this expedition was attended with a series of victories, which did him less honour than an act of generosity towards his colleague; who, willing to take advantage of his absence to signalize himself by some great exploit, hastened to fight Mithridates; but was defeated, and shut up in Calcedonia; where he must have perished, if Lucullus, sacrificing his resentment to the pleasure of saving a Roman citizen, had not flown to his assistance, and

difengaged him. All Pontus then submitted to Lucullus; who being continued in his government of Asia, entered the territories of Tigranes, the most powerful king in Asia. That prince marched with a formidable army against Lucullus: who defeated him with a handful of men, and killed great numbers of his forces; took Tigranocertes, the capital of his kingdom; and was ready to put an end to the war, when the intrigues of a tribune got him deposed, and Pompey nominated in his room.

Lucullus having brought home prodigious riches, now gave himself up to excessive luxury; and his table was served with a profusion till that time unknown. He brought from the East a great number of books, which he formed into a library, and gave admittance to all men of learning, who frequented it in great numbers. Toward the end of his life, he fell into a kind of madness; and Lucullus, his brother, was appointed his guardian. He is said to have been the first who brought cherries into Europe, having brought the grafts from the kingdom of Pontus.

LUCUS, in general, denotes a wood or grove sacred to a deity; so called *à lucendo*, because a great number of lights were usually burning in honour of the god, (Isidorus); a practice common with idolaters, as we learn from Scripture: hence Homer's *Λυκαον αλυσος*.

LUD, a British king mentioned in our old chronicles, and said to have reigned about the year of the world 3878. He is reported to have enlarged and walled about *Troynovant*, or New Troy, where he kept his court, and made it his capital. The name of *London* is hence derived from *Lud's town*; and *Ludgate*, from his being buried near it: but this is only one among many other derivations of the name of London; which are at least equally probable. See *LONDON*.

LUIDIUS, a celebrated painter, lived in the reign of Augustus Cæsar, and excelled in grand compositions. He was the first who painted the fronts of houses in the streets of Rome; which he beautified with great variety of landscapes, and many other different subjects.

LUDLOW (Edmund); son of Sir Henry Ludlow, was born at Maidenhead, and educated in Trinity-college, Oxford. His father opposing the king's interest, Mr Ludlow joined with the same party, and was present at the battle of Edgehill as a volunteer under the earl of Essex. Upon the death of his father, he was chosen knight of the shire for Wilts, and obtained the command of a regiment of horse for the defence of that county. He was one of king Charles I.'s judges: after whose death he was sent by the parliament into Ireland, in quality of lieutenant-general of the horse; which employment he discharged with diligence and success till the death of the lord-deputy Ireton, when he acted for some time as general, though without that title; Cromwell, who knew him to be sincerely in the interest of the commonwealth, always finding out some pretext to hinder the conferring of that character upon him. The last stroke had been given by Ludlow to the Irish rebellion, if the usurpation of Cromwell had not prevented it. Under his power he never acted; and though Cromwell used his utmost efforts, he remained inflexible. After Cromwell's death, he endeavoured to restore the commonwealth;

Lucus  
||  
Ludlow.

Ludlow,  
Ludolph.

wealth; but Charles II. being recalled, he thought proper to conceal himself, and escaped into Switzerland, where he settled. After the revolution, he came over into England, in order to be employed in Ireland against king James: but appearing publicly in London, it gave great offence; and an address was presented by Sir Edward Seymour to king William III. for a proclamation in order to apprehend colonel Ludlow, attainted for the murder of king Charles I. Upon this he returned to Switzerland, where he died. During his retirement in Switzerland, he wrote his Memoirs.

LUDLOW, a town of Shropshire in England, situated in W. Long. 2. 45. N. Lat. 52. 28. It stands at the conflux of the Teme and Corve; and had formerly a strong castle, inclosed by a wall a mile in compass. The president of the council of the marches, established by Henry VIII. generally kept his courts in it, by which the town was much benefited, these courts not having been abolished till the 1st of William and Mary. Its neighbourhood to Wales makes it a great thoroughfare, and engages many of the Welch to send their children of both sexes to it for education. It was incorporated by Edward IV. and among other privileges has that of trying and executing criminals within itself. It is one of the neatest towns in England, with walls, and seven gates. From the castle on the top of the hill on which the town stands, is a most delightful prospect. In an apartment of the out-gatehouse of the palace, Samuel Butler is said to have written the first part of *Hindras*. Here Arthur, elder brother to Henry VIII. died, and was buried in the choir of the church. Without the town, on the north-side, stood anciently a rich priory; of which there are hardly any remains. The river Teme here has a good bridge over it, and dams or weirs across it. In the church are some old monuments of the lords president, &c. The neighbouring country is exceeding pleasant, especially that part called *Corve's Dale*, or the valley along the *Corve*.

LUDOLPH (Job), a very learned writer of the 17th century, was born at Erfurt in Thuringia. He travelled much, and was master of 25 languages; visited libraries, searched after natural curiosities and antiquities every where, and conversed with learned men of all nations. He published a history of Ethiopia, and other curious books.

LUDOLF (Henry William), nephew of Job above-mentioned, was born at Erfurt in 1655. He came over to England as secretary to M. Lenthe, envoy from the court of Copenhagen to that of London; and being recommended to prince George of Denmark, was received as his secretary. He enjoyed this office for some years, until he was incapacitated by a violent disorder; when he was discharged with a handsome pension: after he recovered, he travelled into Muscovy, where he was well received by the czar, and where his knowledge made the Muscovite priests suppose him to be a conjuror. On his return to London in 1694, he was cut for the stone; and as soon as his health would permit, in acknowledgement of the civilities he had received in Muscovy, he wrote a grammar of their language, that the natives might learn their own tongue in a regular method. He then travelled into the East, to inform himself of the state of the Christian church in the Levant; the deplorable condition of which induced him,

after his return, with the aid of the bishop of Worcester, to print an edition of the New Testament in the vulgar Greek, to present to the Greek church. In 1709, when such numbers of Palatines came over to England, Mr Ludolf was appointed by queen Anne one of the commissioners to manage the charities raised for them; and he died early the following year. His collected works were published in 1712.

LUES, among physicians, is in general use for a disease of any kind; but in a more particular sense is restrained to contagious and venereal diseases; thus the *lues Gallica* or *venerica*, signifies the venereal disease. See (the *Index* to) MEDICINE.

LUFF, the order from the pilot to the steersman to put the helm towards the *lee-side* of the ship, in order to make the ship sail nearer the direction of the wind. Hence, luff round, or luff a-lee, is the excess of this movement, by which it is intended to throw the ship's head up in the wind, in order to tack her, &c. A ship is accordingly said to spring her luff, when she yields to the effort of the helm, by sailing nearer to the line of the wind than she had done before. See also *Hauling the Wind*.

LUFF-Tackle, a name given by sailors to any large tackle that is not destined for a particular place, but may be variously employed as occasion requires. It is generally somewhat larger than the jigger tackle, although smaller than those which serve to hoist the heavier materials into and out of the vessel: which latter are the main and fore-tackles, the stay and quarter-tackles, &c.

LUG-SAIL, a square sail, hoisted occasionally on the mast of a boat, or small vessel, upon a yard which hangs nearly at right angles with the mast. These are more particularly used in the *barca longa*, navigated by the Spaniards in the Mediterranean.

LUGDUNUM, (anc. *geog.*), the capital of the Segusiani in Gallia Celtica, situated at the conflux of the Arar and Rhodanus, on an eminence, as the Celtic term *dune* signifies; built by Manutius Plancus under Augustus, while commanding in that part of Gaul; and whither he led a colony. Now *Lyons*, capital of the Lyonois.

LUGDUNUM *Batavorum*, (anc. *geog.*), a town of the Batavi in Gallia Belgica. Now *Leiden* in Holland.

LUGDUNUM *Convenarum*, (anc. *geog.*) a town of Gaul in Aquitain, at the foot of the Pyrenees. Now *S. Bertrand*, in Gascony.

LUGEUS LACUS, (anc. *geog.*) a lake of Japydia, the westmost district of Illyricum, to the south of the Save, and near the head of the Arsa. Now commonly called the *Zirichnitz Lake*, from a small adjoining town: it is locked on every side with mountains; from which scanty currents run down; the less in quantity their waters, because drunk up by the earth; till at length they are swallowed up in rocky furrows so formed, as to resemble artificial. In these the water being so redundant, as to refuse receiving any more, they regurgitate, and return the water with extraordinary celerity; which thus spreading itself, forms a lake, in most places 18 cubits high: and these waters afterwards retire with no less celerity than they came on, not only through the furrows, but pass through the whole of the bottom,

Lues  
#  
Lugens.

**St Luke** as through a sieve; which when perceived by the inhabitants, they directly stop up the larger apertures, and thus take large quantities of fish: when the lake is dry, they cut down their harvest on the spot where they sowed, and flow again before the inundation comes on: and graft shoots so quick on it, that it may be cut down in three weeks time, (Lazius, Werriherus.)  
**Lully.**

**LUKE** (St.), the evangelist, and the disciple of the apostles, was originally of Antioch in Syria, and by profession a physician. He particularly attached himself to St Paul, and was his faithful companion in his travels and labours. He went with him to Troas in Macedonia, about the year 51. He wrote his Gospel in Achaia about the year 53; and, ten years after, the Acts of the Apostles, which contains a history of 30 years. Of all the inspired writers of the New Testament, his works are written in the most elegant Greek. It is believed that St Luke died at Rome, or in Achaia.

*Gospel of St Luke*, a canonical book of the New Testament. Some think that it was properly St Paul's Gospel; and that, when the apostle speaks of *his* Gospel, he means what is called *St Luke's*. Irenæus says, that St Luke digested into writing what St Paul preached to the Gentiles; and Gregory Nazianzen tells us, that St Luke wrote with the assistance of St Paul.

*St Luke the Evangelist's Day*, a festival in the Christian church, observed on the 18th of October.

**LULA**, a town of Swedish Lapland; seated at the mouth of the river Lula, on the west side of the gulph of Bothnia, 42 miles south-west of Tornea. E. Long. 21. o. N. Lat. 64. 30.

**LULA Lapmark**, a province of Swedish Lapland; bounded by that of Tornea on the north, by the Bothnic Gulph on the east, by Pithia Lapmark on the south, and Norway on the west.

**LULLI** (John Baptist), the most celebrated and most excellent musician that has appeared in France since the revival of learning, was born at Florence. He was taken to France when very young by a person of quality; and he carried the art of playing on the violin to the highest perfection. Lewis XIV. made him superintendent of music. Some time after, Perinna having introduced operas into France, and quarrelling with his company, he resigned his privilege to Lulli. Operas were then carried to the utmost perfection by this celebrated musician, and were attended with continual applause. Lulli every year, after this time, gave a piece of his own composition, till his death, which happened in 1687.

**LULLY** (Raymond), a famous writer, surnamed the *Enlightened Doctor*, was born in the island of Majorca in 1225. He applied himself with indefatigable labour to the study of the Arabian philosophy, to chemistry, physic, and divinity; and acquired great reputation by his works. He at length went to preach the gospel in Africa; and was stoned to death in Mauritania, at the age of 80. He is honoured as a martyr at Majorca, whither his body was carried. He wrote many treatises on all the sciences, in which he shews much study and subtilty, but little judgment or solidity. A complete edition of his works has been printed at Mentz.—He ought not to be confounded with Raymond Lully of Terraca, surnamed *Neophyta*, who, from being a Jew, turned Dominican friar. This last

Lully maintained several opinions that were condemned by pope Gregory XI.

**LUMBAGO**, a fixed pain in the small of the back. See (the *Index* subjoined to) *MEDICINE*.

**LUMBARIS**, a name given to the arteries and veins which spread over the loins.

**LUMBRICAL**, a name given to four muscles of the fingers, and to as many of the toes.

**LUMBRICUS**, the *EARTH-WORM*, in zoology, a genus of insects belonging to the order of vermes intestina. The body is cylindrical, annulated, with an elevated belt near the middle. There is but one species of this animal. It lives under ground, and feeds upon the roots and seeds of plants. It comes above ground in the night, or during rain, for the purpose of copulation. For the effects of these animals in the human body, and the method of expelling them, see (the *Index* subjoined to) *MEDICINE*.

**LUMELLO**, a village in Italy, which gives name to the Lumellina, a small district in the duchy of Milan, lying along the river Po, and of which Murtaria and Valencia are the principal places. It was ceded to the duke of Savoy in 1707, and confirmed by the treaty of Utrecht in 1713. E. Long. 8. 42. N. Lat. 45. 5.

**LUMINOUSNESS** of the Sea. See *LIGHT* and *SEA*.

**LUMINOUSNESS** of Putrescent Substances. See *LIGHT*.

**LUMP-FISH**. See *CYCLOPTERUS*.

**LUNA**, in astronomy, the moon. See *ASTRONOMY*, *passim*.

**LUNA Cornea**. See *CHEMISTRY*, n° 239, 366.

**LUNACY**, the madness of a person who formerly hath had the use of his reason, but hath lost it by disease, grief, or some other accident. See *MEDICINE*.

**LUNACY**, in law. See *IDIOT* and *LUNATIC*.

**LUNATIC**, a person affected with lunacy. The word is indeed properly applied to one that hath lucid intervals; sometimes enjoying his senses, and sometimes not; and that frequently supposed to depend on the influence of the moon.

**LUNATIC**, in law. Under the general term of *non compos mentis*, (which Sir Edward Coke says is the most legal name) are comprized not only lunatics, but perous under frenzies, or who lose their intellects by disease; those that grow deaf, dumb, and blind, not being *born* so; or such, in short, as are judged by the court of chancery incapable of conducting their own affairs. To these also, as well as idiots, the king is guardian, but to a very different purpose. For the law always imagines, that these accidental misfortunes may be removed; and therefore only constitutes the crown a trustee for the unfortunate persons, to protect their property, and to account to them for all profits received, if they recover, or after their decease to their representatives. And therefore it is declared by the statute 17 Edw. II. c. 10. that the king shall provide for the custody and sustentation of lunatics, and preserve their lands, and the profits of them, for their use when they come to their right mind; and the king shall take nothing to his own use: and if the parties die in such estate, the residue shall be distributed for their souls by the advice of the ordinary, and of course (by the subsequent amendments of the law of admini-

Lunatic  
||  
Lunen-  
burg.

nistrations) shall now go to their executors or administrators.

On the first attack of lunacy, or other occasional infirmity, when there may be hopes of a speedy restoration of reason, it is usual to confine the unhappy objects in private custody under the direction of their nearest friends and relations: and the legislature, to prevent all abuses incident to such private custody, hath thought proper to interpose its authority, by 14 Geo. III. c. 49. for regulating private mad-houses. But, when the disorder is grown permanent, and the circumstances of the party will bear such additional expence, it is thought proper to apply to the royal authority to warrant a lasting confinement.

The method of proving a person *non compos* is very similar to that of proving him an idiot. The lord chancellor, to whom, by special authority from the king, the custody of idiots and lunatics is intrusted, upon petition or information, grants a commission in nature of the writ *de idiota inquirendo*, to inquire into the party's state of mind; and if he be found *non compos*, he usually commits the care of his person, with a suitable allowance for his maintenance, to some friend, who is then called his committee. However, to prevent sinister practices, the next heir is seldom permitted to be of this committee of the person; because it is his interest that the party should die. But, it hath been said, there lies not the same objection against his next of kin, provided he be not his heir; for it is his interest to preserve the lunatic's life, in order to increase the personal estate by savings, which he or his family may hereafter be entitled to enjoy. The heir is generally made the manager or committee of the estate, it being clearly his interest by good management to keep it in condition; accountable, however, to the court of chancery, and to the *non compos* himself, if he recovers; or otherwise, to his administrators. See IDIOT.

LUNDEN, a considerable town of Sweden, in Gothland; and capital of the territory of Schonon, with an archbishop's see, and an university. It was ceded to the Swedes by the Danes in 1658. E. Long. 13. 25. N. Lat. 55. 40.

LUNENBURG, or LUNEBURG Zell, a principality of Germany, bounded to the south by that of Calenberg, the diocese of Hildelheim, and the duchy of Brunfwic; to the north, by the duchy of Lauenburg and the Elbe, by the last of which it is separated from the territory of the imperial city of Hamburg; to the east, by the duchy of Brunfwic, the Alte-Mark, and the duchy of Mecklenburg; and to the west, by the duchies of Bremen and Verden, the county of Hoya, and the principality of Calenberg. The soil, except along the Elbe, Aller, and Jetz, is either sand, heath, or moors. In the more fruitful parts of it are produced wheat, rye, barley, oats, pease, buck wheat, flax, hemp, hops, pulse, oak, beech, firs, pines, birch, and alder, together with black cattle and horses. The heaths abound with bees and honey, and a small kind of sheep whose wool is long and coarse. Lunenburg is well furnished with salt springs and limestone, and the forest of Garde with venison. The rivers Elbe, Ilmenau, and Aller, are navigable; and consequently very advantageous to the country, independent of the

fish which they yield. The general diets of this principality are convened by the sovereign twice a year, and held at Zell. They consist of the deputies of the nobility and the towns of Luneburg, Uelzen, and Zell, who have the nomination of the members of the high colleges, and other officers, jointly with the sovereign. There are near 200 Lutheran churches in the country, under two general and 15 subordinate superintendents, several grammar-schools, two Calvinist churches at Zell, and an academy of exercises at Luneburg. The manufactures are chiefly linen cloth, cottons, ribbons, stockings, hats, starch, bleached wax, refined sugar, gold and silver wires, all kinds of wooden wares, barges, boats, and ships. The exports of these to Hamburg, Lubec, and Altena, are considerable. The neighbourhood of these cities, with the facility of conveying goods and merchandize to them and other places, either by land or water, is very advantageous to this country, and contributes greatly to its subsistence. On account of this principality, the king of Great Britain has a seat and voice both in the college of the princes of the empire, and of the circle of Lower-Saxony. Its quota in the Matricula is 20 horse and 120 foot, or 720 florins in lieu of them. The revenues of the principality arise chiefly from the demefnes, tolls on the Elbe, contributions, duties on cattle, beer, wine, brandy, and other commodities, which all together must be very considerable, some bailiwicks alone yielding upwards of 20,000 rix-dollars.

LUNEBURG, the capital of the principality of the same name, is a pretty large town of Germany, on the river Elmen, or the Ilmenau, which is navigable from the town to the Elbe, at the distance of 13 miles. It is 27 miles from Hamburg, 43 from Zell, 65 from Brunfwic, 76 from Bremen, 68 from Hanover; and stands in E. Long. 10. 40. N. Lat. 53. 28. Its inhabitants are reckoned at between 8000 and 9000. Formerly this town was one of the Hanse, and an imperial city. Some derive its name from *Lina*, the ancient name of the Ilmenau; others from *Luna*, the moon, an image of which is said to have been worshipped by the inhabitants in the times of Paganism. Here were anciently several convents, viz. one of Minims, another of Premonstratensians, another of Benedictines, and a fourth of Minorites. Out of the revenues of the Benedictine monastery was founded an academy for the martial exercises, where young gentlemen of the principality of Luneburg are maintained gratis, and taught French, fencing, riding, and dancing; but foreigners are educated at a certain fixed price. A Latin school was also founded, consisting of four classes, and well-endowed out of these revenues. The superintendency and management of these, and the estates appropriated to their maintenance, belongs to the landtschaft director, and the anfreiter, who are both chosen from among the Luneburg nobility. The first came in place of the Popish abbot, and as such is head of the states of the principality, and president of the provincial college. He has the title of *excellency*; and in public instruments styles himself, *by the grace of God landtschaft director, and lord of the mansion of St Michael in Luneburg*. The chief public edifices are three parish-churches, the ducal palace, three hospitals, the town-house,

Lunen-  
burg.

Lungs  
Lupercalia.

houfe, the falt-magazine, the anatomical theatre, the academy; the conventual church of St Michael, in which lie interred the ancient dukes; and in which is the famous table eight foot long, and four wide, plated over with chased gold, with a rim embellished with precious ftones, of an immense value, which was taken from the Saracens by the emperor Otho, and prefented to this church; but in 1698, a gang of thieves ftripped it of 200 rubies and emeralds, together with a large diamond, and moft of the gold, fo that at prefent but a fmall part of it remains. Here are fome very rich falt-fprings. Formerly, when there was a greater demand for the falt, upwards of 120,000 tons have been annually boiled here, and fold off; but fince the commencement of the prefent century, the falt-trade hath declined greatly. A fifth of the falt made here belongs to the king, but is farmed out. It is faid to excel all the other falt made in Germany. This town is well fortified; and has a garrifon, which is lodged in barracks. In the neighbourhood is a good lime-ftone-quarry; and along the Ilmenau are ware-houfes, in which are lodged goods brought from all parts of Germany, to be forwarded by the Elmenau to Hamburg, or by the Alche to Lubec, from whence other goods are brought back the fame way. The town itfelf drives a confiderable traffic in wax, honey, wool, flax, linen, falt, lime, and beer.

LUNGS. See ANATOMY, n° 381.

LUNG-Wort, in botany. See PULMONARIA.

LUNGS of Infefts. In the fly-clafs, the fligmata are extremely numerous; and the trachea which they terminate are branched and divaricated all over the body in an amazing manner, as if every part and particle of the bodies of thefe little creatures had occafion for its particular air-veffels: beftdes thefe, however, flies are provided with proper lungs. They have two; and thofe fo very large, that they frequently take up half, and fometimes two thirds, of the body of the animal.—There are two bladders placed fide-ways, one by the other, alike in fhape and fize; and having their origin at the junction of the corecelet and body, and, in many flies whole bodies are compofed of five rings, extending to the third, and fometimes to the fourth. The fize and figure of each of thefe bladders is fuch as is neceffary to fill almoft entirely that cavity of the body in which it is lodged. They each of them touch the fides of this cavity; the part where they join one another is flat, and this commiffure forms a line running ftraight down the body; they are, however, in this part, though fo clofely in contact, yet not at all joined to one another. This commiffure, however, does not reach quite up to the back, or quite down to the belly: there is a fmall cavity left between each, which was very neceffary in both places; the one to give paffage to the great artery, the other to the excrements.

LUNISOLAR YEAR, in chronology, the fpace of 532 common years; found by multiplying the cycle of the fun by that of the moon.

LUNULA, in geometry, a plane figure like a crefcent or half-moon.

LUPERCALIA, feaft instituted in ancient Rome, in honour of the god Pan.—The word comes from *Lupercal*, the name of a place under the Palatine mountain, where the facrifices were performed.

The Lupercalia were celebrated on the 15th of the Vol. VI.

kalends of March, that is, on the 15th of February, or, as Ovid obferves, on the third day after the ides. They are fuppofed to have been eftablifhed by Evander.

On the morning of this feaft, the luperci, or priefts of Pan, ran naked thro' the ftreets of Rome, ftriking the married women they met on the hands and belly, with a thong, or ftrap of goat's leather, which was held an omen promifing them fecundity and happy deliveries. See LUPERICI.

This feaft was abolifhed in the time of Auguftus; but afterwards reftored, and continued to the time of the emperor Anaftafius.—Baronius fays, it was abolifhed by the pope in 496.

LUPERICI, a name given to the priefts of the god Pan. See LUPERCALIA.

The *luperci* were the moft ancient order of priefts in Rome; they were divided into two colleges, or companies, the one called *Fabii*, and the other *Quintilii*. To thefe Cæfar added a third, which he called *Julii*.

LUPINUS, LUPINE; a genus of the diadelphia order, belonging to the decandria clafs of plants. There are feven fpecies, fix of them hardy herbaceous flowery annuals, and one perennial; rifing with upright ftalks from one to three or four feet high; ornamented with digitate or fingered leaves, and terminated by long whorled fpike of papilionaceous flowers, white, blue, yellow, and rofe-coloured. They are all eafily raifed from feed; and fucceed in any open borders, where they make a fine variety.

LUPULUS, in botany. See HUMULUS.

LUPUS, in zoology. See CANIS.

LUPUS-Marinus. See ANARRHICHAS.

LUPUS, in aftronomy. See there, n° 206.

LURCHER, a kind of hunting-dog much like a mongrel gre-bound, with pricked ears, a fhagged coat, and generally of a yellowifh white colour: they are very fwift runners, fo that if they get between the burrows and the conies, they feldom mifs; and this is their common practice in hunting: yet they ufe other fubtilties, as the tumbler does, fome of them bringing in their game, and thofe are the beft. It is alfo obfervable, that a lurcher will run down a hare at fretch.

LURE, in falconry, a device of leather, in the fhape of two wings, ftruck with feathers, and baited with a piece of flefh, to call back a hawk when at confiderable diftance.

LURIDÆ, the name of the 28th order in Linneus's fragments of a natural method, confifting of plants whole pale and ominous appearance feems to indicate fomething baleful and noxious in their nature and quality. This order contains the following genera, viz. atropa, browallia, capficum, catebæa, celafia, celtium, datura, digitalis, ellifia, hyofcyamus, lycium, nicotiana, padalum, phyalis, fefamum, folanum, ftrychnus, and verbacum.

LUSATIA, a marquisate of Germany, in Upper Saxony; bounded to the eaft by Silefia, to the weft by Mifnia, to the fouth by Bohemia, and to the north by the marquisate by Brandenburg. Till towards the middle of the 15th century, the Upper Lufatia was called the *Mark*, i. e. the marquisfité or the land, of *Budifzin* and *Gorlitz*; and the Lower only *Lufatia*, which,

Lufatia.

which, it is said, in the Slavonic, signifies a woody or marshy country. The air of the Upper Lufatia, which is hilly or mountainous, is better than that of the Lower, a great part of which is moorish and boggy. Both abound in wood, especially the Lower, and turf for fuel. The heathy and mountainous tracts are generally barren; but the lower champaign and marsh lands, are tolerably fertile, producing pasture, wheat, rye, oats, barley, buck-wheat, peas, lentils, beans, and millet; together with flax, hops, tobacco, some white and red wine, and what is called *mannä*. Of several of these articles, however, considerable quantities are imported. In this country are found also quarries of stone, medicinal springs, bastard diamonds, agates, and jaspers, earthen and clays for tobacco-pipes and all sorts of earthen ware, alum, good iron, stone, vitriolic and copper water; nor is it destitute of cattle, fish, and venison. The rivers Spree, the Schwarze or Black Elster, and the Pulnitz, have their sources in the Lufatias, which are also watered by the Neisse and Queis. The ancient inhabitants of this country were the Saxons, who were succeeded by the Vandals, and these by the Sorber Wends, a Slavonian people. The present inhabitants, the descendants of the Wends, have an odd dress; and the language is so inarticulate and guttural, that it hath been said, it might be pronounced without lips, teeth, or tongue: but the towns are almost wholly peopled by Germans.

In the Upper Lufatia are six towns which appear at the land-diets, 16 smaller country-towns, and four market towns. In the Lower are four diet-towns, 13 country towns, and two market ones. Both marquises were formerly subject either to the kings of Bohemia, the archdukes of Austria, or electors of Brandenburg; but, in 1636, both were absolutely ceded to the elector of Saxony, in lieu of the 72 tons of gold, which he expended in assisting the emperor Ferdinand II. against the Bohemians.

Christianity was first planted in Lufatia in the seventh century; but it was several centuries after that, before Popery was fully established. In the 11th century many cloisters were erected in the country; but at the reformation such numbers embraced Lutheranism, that it became the predominant religion, and still continues, though there are still several Roman Catholic foundations, churches, market towns, and villages. The enthusiastic sect of HERNHUTERS possesses a great influence and esteem here. There are considerable manufactures of woollen and linen stuffs in the Lufatias, especially the Upper. At Budissen, and in the adjacent country, prodigious quantities of stockings, spatterdashies, caps, and gloves, are made. The linen manufactures also flourish here, chiefly in the Upper-Lufatia, where all sorts of linen are made, printed, and dyed. Exclusive of these, there are considerable manufactures of hats, leather, paper, gunpowder, iron, glass, bleached wax, &c. Though the demand and exportation of these commodities, particularly linens and woollens, is not so great as formerly, yet it is still considerable, and more than over-balances their importations in wool, yarn, silk, wines, spices, corn, fresh and baked fruits, garden-stuff, and hops. Disputes of many years standing have subsisted between the country-artificers and linen-manufacturers on the

one side, and the diet-towns on the other; the latter unjustly seeking to exclude the former from any share in the linen-trade. The natives of this country are said to have quick natural parts, but to be fordidly penurious. We are told they observe the Saxon laws much better than they did the Bohemian. Learning hath been much esteemed and encouraged in both marquises since the reformation. The schools in the six diet-towns of Upper-Lufatia, particularly at Gorlitz, Budissen, and Zittau, greatly distinguish themselves, having handsome stipends. In Lower Lufatia also are some good schools, with stipends for the maintenance of students. Printing is said to be much followed, and brought to great perfection in this country.

In Upper-Lufatia, the states consist, 1st, of those called *state-lords*; 2dly, of the prelates; 3dly, of the gentry and commonalty, under which are comprehended the counts, barons, nobles, and burgesses, possessors of fees and fief-estates; and, 4thly, of the representatives of the six principal towns. Without the consent of these states no taxes can be imposed, nor any thing of importance, that regards the public, transacted. The diets are ordinary or extraordinary. The ordinary meet once in three years, and the extraordinary when summoned by the sovereign upon particular emergencies. As to ecclesiastical matters, the dean of Budissen and his consistory exercise all manner of episcopal jurisdiction; and, among the Protestants, the jurisdiction belongs either to the superior, the upper-office, or the patrons. The revenues arising to the superior or sovereign, from Upper-Lufatia, consist partly of the subsidies granted by the states, among which, at present, are reckoned capitation and estate-money; and partly of the beer-tax, excise, tolls, &c. —Upper Lufatia is divided into two great circles, viz. those of Budissen and Gorlitz, which are again divided into Lesser circles.

The land-states of Lower Lufatia consist, like those of the Upper, of prelates, lords, and knights, and the representatives of the state towns, which are Luekau, Gubben-Lubben, and Kalau. Two land-diets are yearly held at Lubben, called *voluntary-diets*; but when the superior causes the states to be summoned together at his discretion, and propositions to be laid before them, by commissaries deputed for that purpose, such convention is called a *great land-diet*. The marquise is divided into five circles, each of which holds a circle-assembly in its circle-town. The chief officers appointed either by the superior or the states, are, the president of the upper-office, the land captain, and the land judge. The principal tribunals are, the land-court, and the upper-office, to which lie appeals from the inferior judicatories. There are also officers for the several circles. Spiritual matters belong here to a consistory, erected in 1668. The ordinary taxes are paid in the chest of the circle; and from thence consigned to the general chest, of which the upper tax-receiver is superintendent. By him an annual account of the receipts is made out, which is examined and passed by the deputies of the states.

LUSITANIA, (anc. geog.) one of the divisions of Spain, extending to the north of the Tagus, quite to the sea of Cantabria, at least to the Promontorium Celticum. But Augustus, by a new regulation, made the Anas its boundary to the south, the Durus to the

Lufatia, Lusitania.

**Lustration**, the north; and thus constituting only a part of the modern Portugal. *Lufitani* the people, (Diodorus, Stephanus).

or stuff. It is likewise used to denote the composition or manner of giving that gloss.

**LUSTRATION**, in antiquity, sacrifices or ceremonies by which the ancients purified their cities, fields, armies, or people, defiled by any crime or impurity. Some of these lustrations were public, others private. There were three species or manners of performing lustration, viz. by fire and sulphur, by water, and by air; which last was done by fanning and agitating the air round the thing to be purified. Some of these lustrations were necessary, *i. e.* could not be dispensed with; as lustrations of houses in time of a plague, or upon the death of any person: others again were done out of choice, and at pleasure. The public lustrations at Rome were celebrated every fifth year; in which they led a victim thrice round the place to be purified, and in the mean time burnt a great quantity of perfumes. Their country lustrations, which they called *ambarvalia*, were celebrated before they began to reap their corn: in those of the armies, which they called *armilustria*, some chosen soldiers crowned with laurel, led the victims, which were a cow, a sheep, and a bull, thrice round the army ranged in battle-array in the field of Mars, to which deity the victims were afterwards sacrificed, after pouring out many imprecations upon the enemies of the Romans. The lustrations of their flocks were performed in this manner: the shepherd sprinkled them with pure water, and thrice surrounded his sheepfold with a composition of fawn, laurel, and brimstone set on fire; and afterwards sacrificed to the goddesses Pales an offering of milk boiled, wine, a cake, and millet. As for private houses, they were lustrated with water, a fumigation of laurel, juniper, olive-tree, fawn, and such like; and the victim commonly was a pig. Lustrations made for particular persons were commonly called *expiations*, and the victims *piacula*. There were also a kind of lustration used for infants, by which they were purified, girls the third, and boys the ninth day after their birth; which ceremony was performed with pure water and spittle. See the article **AMBARVALIA**. In their lustratory sacrifices, the Athenians sacrificed two men, one for the men of their city, and the other for the women. Divers of these expiations were austere: some fasted; others obtained from all sensual pleasures; and some, as the priests of Cybele, castrated themselves. The postures of the penitents were different, according to the different sacrifices. The priests changed their habits according to the ceremony to be performed; white, purple, and black, were the most usual colours. They cast into the river, or at least out of the city, the animals or other things that had served for a lustration or sacrifice of atonement; and thought themselves threatened with some great misfortune when by chance they trod upon them. Part of these ceremonies were abolished by the emperor Constantine, and his successors: the rest subsisted till the Gothic kings were masters of Rome; under whom they expired, excepting what the popes thought proper to adopt and bring into the church.

For the lustration, or rather expiation, of the ancient Jews, see **EXPIATION**.

**LUSTRE**, the gloss or brightness appearing on any thing, particularly on manufactures of silk, wool,

The lustre of silks is given them by washing in soap, then clear water, and dipping them in alum-water cold. To give stuffs a beautiful lustre: For every 8 pounds of stuff allow a quarter of a pound of linseed; boil it half an hour, and then strain it through a cloth, and let it stand till it is turned almost to a jelly: afterwards put an ounce and a half of gum to dissolve 24 hours; then mix the liquor, and put the cloth into this mixture; take it out, dry it in the shade, and press it. If once doing is not sufficient, repeat the operation. Carriers give a lustre to black leather first with juice of barberries, then with gum-arabic, ale, vinegar, and Flanders-glue, boiled together. For coloured leather, they use the white of an egg beaten in water. Morroccos have their lustre from juice of barberries, and lemon or orange. For hats, the lustre is frequently given with common water; sometimes a little black dye is added: the same lustre serves for furs, except that for very black furs they sometimes prepare a lustre of galls, copperas, Roman alum, ox's marrow, and other ingredients.

**LUSTRUM**, in Roman antiquity, a general muster and review of all the citizens and their goods, which was performed by the censors every fifth year, who afterwards made a solemn lustration. See the article **LUSTRATION**.

This custom was first instituted by Servius Tullius, about 180 years after the foundation of Rome. In course of time the lustra were not celebrated so often, for we find the fifth lustrum celebrated at Rome only in the 574th year of that city.

**LUTE**, or **LUTING**, among chemists, a mixed, tenacious, ductile substance, which grows solid by drying, and, being applied to the juncture of vessels, stops them up so as to prevent the air from getting either in or out. See **CHEMISTRY**, n° 78—81.

**LUTE**, is also a musical instrument with strings.—The lute consists of four parts, viz. the table, the body or belly, which has nine or ten sides; the neck, which has nine or ten stops or divisions, marked with strings; and the head, or cross, where the screw for raising and lowering the strings to a proper pitch of tone are fixed. In the middle of the table there is a rose or passage for the sound; there is also a bridge that the strings are fastened to, and a piece of ivory between the head and the neck to which the other extremities of the strings are fitted. In playing, the strings are struck with the right hand, and with the left the stops are pressed. The lutes of Bologna are esteemed the best on account of the wood, which is said to have an uncommon disposition for producing a sweet sound.

**LUTHER** (Martin), the celebrated author of the Reformation, was a native of Eisleben in Saxony, and born in 1483. Tho' his parents were poor, he received a learned education; during the progress of which, he gave many indications of uncommon vigour and acuteness of genius. As his mind was naturally susceptible of serious impressions, and tinged with somewhat of that religious melancholy which delights in the solitude and devotion of a monastic life, he retired into a convent of Augustinian friars; where he acquired great reputation, not only for piety, but for love of knowledge, and unwearied application to study. The

**L U T H E R.** cause of this retirement is said to have been, that he was once struck by lightning, and his companion killed by his side by the same flash. He had been taught the scholastic philosophy which was in vogue in those days, and made considerable progress in it: but happening to find a copy of the Bible which lay neglected in the library of his monastery, he applied himself to the study of it with such eagerness and assiduity, as quite astonished the monks; and increased his reputation for sanctity so much, that he was chosen professor first of philosophy, and afterwards of theology, at Wittenberg on the Elbe, where Frederic elector of Saxony had founded an university.

While Luther continued to enjoy the highest reputation for sanctity and learning, Tetzel, a Dominican friar, came to Wittenberg in order to publish indulgences. Luther beheld his success with great concern; and having first inveighed against indulgences from the pulpit, he afterwards published 95 theses, containing his sentiments on that subject. These he proposed, not as points fully established, but as subjects of inquiry and disputation. He appointed a day on which the learned were invited to impugn them either in person or by writing; and to the whole he subjoined solemn protestations of his high respect for the apostolic see, and of his implicit submission to its authority. No opponent appeared at the time prefixed; the theses spread over Germany with astonishing rapidity, and were read with the greatest eagerness.

Though Luther met with no opposition for some little time after he began to publish his new doctrines, it was not long before many zealous champions arose to defend those opinions with which the wealth and power of the clergy were so strictly connected. Their cause, however, was by no means promoted by these endeavours; the people began to call in question even the authority of the canon law, and of the pope himself.—The court of Rome at first despised these new doctrines and disputes; but at last the attention of the pope being raised by the great success of the reformer, and the complaints of his adversaries, Luther was summoned, in the month of July 1518, to appear at Rome, within 60 days, before the auditor of the chamber. One of Luther's adversaries, named Prierias, who had written against him, was appointed to examine his doctrines, and to decide concerning them. The pope wrote at the same time to the elector of Saxony, beseeching him not to protect a man whose heretical and profane tenets were so shocking to pious ears; and enjoined the provincial of the Augustinians to check by his authority the rashness of an arrogant monk, which brought disgrace upon their order, and gave offence and disturbance to the whole church.

From these letters, and the appointment of his open enemy Pereira to be his judge, Luther easily saw what sentence he might expect at Rome; and therefore discovered the utmost solicitude to have his cause tried in Germany, and before a less suspected tribunal. He wrote a submissive letter to the pope, in which he promised an unreserved obedience to his will, for as yet he entertained no doubt of the divine original of the pope's authority; and by the intercession of the other professors, Cajetan the pope's legate in

**L U T H E R.** Germany was appointed to hear and determine the cause. Luther appeared before him without hesitation: but Cajetan thought it below his dignity to dispute the point with a person so much his inferior in rank; and therefore required him, by virtue of the apostolic powers with which he was clothed, to retract the errors which he had uttered with regard to indulgences and the nature of faith, and to abstain for the future from the publication of new and dangerous opinions; and at the last forbade him to appear in his presence, unless he proposed to comply with what had been required of him.

This haughty and violent manner of proceeding, together with some other circumstances, gave Luther's friends such strong reasons to suspect that even the imperial safe-conduct would not be able to protect him from the legate's power and resentment, that they prevailed on him secretly to withdraw from Augsburg, where he had attended the legate, and to return to his own country. But before his departure, according to a form of which there had been some examples, he prepared a solemn appeal from the pope, ill-informed at that time concerning his cause, to the pope, when he should receive more full intimation with respect to it.—Cajetan, enraged at Luther's abrupt retreat, and at the publication of his appeal, wrote to the elector of Saxony, complaining of both; and requiring him, as he regarded the peace of the church, or the authority of its head, either to send that seditious monk a prisoner to Rome, or to banish him out of his territories. Frederic had hitherto, from political motives, protected Luther, as thinking he might be of use in checking the enormous power of the see of Rome; and though all Germany resounded with his fame, the elector had never yet admitted him into his presence. But upon this demand made by the cardinal, it became necessary to throw off somewhat of his former reserve. He had been at great expence and bestowed much attention on founding a new university, an object of considerable importance to every German prince; and foreseeing how fatal a blow the removal of Luther would be to its reputation, he not only declined complying with either of the pope's requests, but openly discovered great concern for Luther's safety.

The situation of our reformer, in the mean time, became daily more and more alarming. He knew very well what were the motives which induced the elector to afford him protection, and that he could by no means depend on a continuance of his friendship. If he should be obliged to quit Saxony, he had no other asylum, and must stand exposed to whatever punishment the rage or bigotry of his enemies could inflict; and so ready were his adversaries to condemn him, that he had been declared a heretic at Rome before the expiration of the 60 days allowed him in the citation for making his appearance. Notwithstanding all this, however, he discovered no symptoms of timidity or remissness; but continued to vindicate his own conduct and opinions, and to inveigh against those of his adversaries with more vehemence than ever. Being convinced, therefore, that the pope would soon proceed to the most violent measures against him, he appealed to a general council, which he affirmed to be the representative of the Catholic church,

Luther.

and superior in power to the pope, who, being a fallible man, might err, as St Peter, the most perfect of his predecessors, had done.

The court of Rome were equally assiduous in the mean time to crush the author of these new doctrines which gave them so much uneasiness. A bull was issued by the pope, of a date prior to Luther's appeal, in which he magnified the virtues of indulgences, and subjected to the heaviest ecclesiastical censures all who presumed to teach a contrary doctrine. Such a clear decision of the sovereign pontiff against him might have been very fatal to Luther's cause, had not the death of the emperor Maximilian, which happened on January 17th 1519, contributed to give matters a different turn. Both the principles and interest of Maximilian had prompted him to support the authority of the see of Rome: but, in consequence of his death, the vicariate of that part of Germany which is governed by the Saxon laws devolved to the elector of Saxony; and, under the shelter of his friendly administration, Luther himself enjoyed tranquillity, and his opinions took such root in different places, that they could never afterwards be eradicated. At the same time, as the election of an emperor was a point more interesting to the pope (Leo X.) than a theological controversy which he did not understand, and of which he could not foresee the consequences, he was so extremely solicitous not to irritate a prince of such considerable influence in the electoral college as Frederick, that he discovered a great unwillingness to pronounce the sentence of excommunication against Luther, which his adversaries continually demanded with the most clamorous importunity.

From the reason just now given, and Leo's natural aversion to severe measures, a suspension of proceedings against Luther took place for 18 months, though perpetual negotiations were carried on during this interval in order to bring the matter to an amicable issue. The manner in which these were conducted having given our reformer many opportunities of observing the corruption of the court of Rome, its obstinacy in adhering to established errors, and its indifference about truth, however clearly proposed or strongly proved, he began, in 1520, to utter some doubts with regard to the divine original of the papal authority which he publicly disputed with Ecceus, one of his most learned and formidable antagonists. The dispute was indecisive, both parties claiming the victory; but it must have been very mortifying to the partisans of the Romish church to hear such an essential point of their doctrine publicly attacked.

The Papal authority being once suspected, Luther proceeded to push on his inquiries and attacks from one doctrine to another, till at last he began to shake the firmest foundations on which the wealth and power of the church were established. Leo then began to perceive that there were no hopes of reclaiming such an incorrigible heretic; and therefore prepared to denounce the sentence of excommunication against him. The college of cardinals was often assembled, in order to prepare the sentence with due deliberation; and the ablest canonists were consulted how it might be expressed with unexceptionable formality. At last it was issued on the 15th of June 1520. Forty-one propositions, extracted out of Luther's works, were therein

Luther.

condemned as heretical, scandalous, and offensive to pious ears; all persons were forbidden to read his writings, upon pain of excommunication; such as had any of them in their custody were commanded to commit them to the flames; he himself, if he did not, within 60 days, publicly recant his errors, and burn his books, was pronounced an obdurate heretic, excommunicated, and delivered to Satan for the destruction of the flesh; and all secular princes were required, under pain of incurring the same censure, to seize his person, that he might be punished as his crimes deserved.

Luther was not in the least disconcerted by this sentence, which he had for some time expected. He renewed his appeal to the general council; declared the pope to be that antichrist, or man of sin, whose appearance is foretold in the New Testament; declaimed against his tyranny with greater vehemence than ever; and at last, by way of retaliation, having assembled all the professors and students in the university of Wittemberg, with great pomp, and in the presence of a vast multitude of spectators, he cast the volumes of the canon law, together with the bull of excommunication, into the flames. The manner in which this action was justified, gave still more offence than the action itself. Having collected from the canon law some of the most extravagant propositions with regard to the plenitude and omnipotence of the pope's power, as well as the subordination of all secular jurisdiction to his authority, he published these with a commentary, pointing out the impiety of such tenets, and their evident tendency to subvert all civil government.

On the accession of Charles V. to the empire, Luther found himself in a very dangerous situation. Charles, in order to secure the pope's friendship, had determined to treat him with great severity. His eagerness to gain this point, rendered him not averse to gratify the papal legates in Germany, who insisted, that, without any delay or formal deliberation, the diet then sitting at Worms ought to condemn a man whom the pope had already excommunicated as an incorrigible heretic. Such an abrupt manner of proceeding, however, being deemed unprecedented and unjust by the members of the diet, they made a point of Luther's appearing in person, and declaring whether he adhered or not to those opinions which had drawn upon him the censures of the church. Not only the emperor, but all the princes through whose territories he had to pass, granted him a safe conduct; and Charles wrote to him at the same time, requiring his immediate attendance on the diet, and renewing his promises of protection from any injury or violence. Luther did not hesitate one moment about yielding obedience; and set out for Worms, attended by the herald who had brought the emperor's letter and safe-conduct. While on his journey, many of his friends, whom the fate of Huss, under similar circumstances, and notwithstanding the same security of an imperial safe-conduct, filled with solicitude, advised and intreated him not to rush wantonly into the midst of danger. But Luther, superior to such terrors, silenced them with this reply, "I am lawfully called (said he) to appear in that city; and thither will I go in the name of the Lord, though as many devils as there are tiles on the houses were there combined against me."

The reception which he met with at Worms, was such

Luther.

such as might have been reckoned a full reward of all his labours, if vanity and the love of applause had been the principles by which he was influenced. Greater crowds assembled to behold him, than had appeared at the emperor's public entry; his apartments were daily filled with princes and personages of the highest rank; and he was treated with an homage more sincere, as well as more flattering, than any which pre-eminence in birth or condition can command. At his appearance before the diet, he behaved with great decency, and with equal firmness. He readily acknowledged an excess of acrimony and vehemence in his controversial writings; but refused to retract his opinions unless he were convinced of their falsehood, or to consent to their being tried by any other rule than the word of God. When neither threats nor intreaties could prevail on him to depart from this resolution, some of the ecclesiastics proposed to imitate the example of the council of Constance, and, by punishing the author of this pestilent heresy, who was now in their power, to deliver the church at once from such an evil. But the members of the diet refusing to expose the German integrity to fresh reproach by a second violation of public faith, and Charles being no less unwilling to bring a stain upon the beginning of his administration by such an ignominious action, Luther was permitted to depart in safety. A few days after he left the city, a severe edict was published in the emperor's name, and by authority of the diet, depriving him, as an obdurate and excommunicated criminal, of all the privileges which he enjoyed as a subject of the empire, forbidding any prince to harbour or protect him, and requiring all to seize his person as soon as the term specified in his protection should be expired.

But this rigorous decree had no considerable effect; the execution of it being prevented partly by the multiplicity of occupations which the commotions in Spain, together with the wars in Italy and the Low Countries, created to the emperor; and partly by a prudent precaution employed by the elector of Saxony, Luther's faithful patron. As Luther, on his return from Worms, was passing near Altenstein in Thuringia, a number of horsemen in masks rushed suddenly out of a wood, where the elector had appointed them to lie in wait for him, and, surrounding his company, carried him, after dismissing all his attendants, to Wartburg, a strong castle not far distant. There the elector ordered him to be supplied with every thing necessary or agreeable; but the place of his retreat was carefully concealed, until the fury of the present storm against him began to abate, upon a change in the political system of Europe. In this solitude, where he remained nine months, and which he frequently called his *Palmyra*, after the name of that island to which the apostle John was banished, he exerted his usual vigour and industry in defence of his doctrines, or in confutation of his adversaries, publishing several treatises, which revived the spirit of his followers, astonished to a great degree and disheartened at the sudden disappearance of their leader.

Luther, weary at length of his retirement, appeared publicly again at Wittenberg, upon the 6th of March 1522. He appeared indeed without the elector's leave; but immediately wrote him a letter, to prevent his ta-

Luther.

king it ill. The edict of Charles V. as severe as it was, had given little or no check to Luther's doctrine: for the emperor was no sooner gone into Flanders, than his edict was neglected and despised, and the doctrine seemed to spread even faster than before. Carolostadius, in Luther's absence, had pushed things on faster than his leader; and had attempted to abolish the use of mass, to remove images out of the churches, to let aside auricular confession, invocation of saints, the abstaining from meats; had allowed the monks to leave their monasteries, to neglect their vows, and to marry; in short, had quite changed the doctrine and discipline of the church at Wittenberg: all which, though not against Luther's sentiments, was yet blamed by him, as being rashly and unseasonably done. Lutheranism was still confined to Germany: it was not got to France; and Henry VIII. of England made the most rigorous acts to hinder it from invading his realm. Nay, he did something more: to shew his zeal for religion and the holy see, and perhaps his skill in theological learning, he wrote a treatise *Of the seven sacraments*, against Luther's book *Of the captivity of Babylon*; which he presented to Leo X. in October 1521. The pope received it very favourably; and was so well pleased with the king of England, that he complimented him with the title of *Defender of the faith*. Luther, however, paid no regard to his kingship; but answered him with great sharpness, treating both his person and performance in the most contemptuous manner. Henry complained of Luther's rude usage of him to the princes of Saxony; and Fisher, bishop of Rochester, replied to his answer, in behalf of Henry's treatise: but neither the king's complaint, nor the bishop's reply, was attended with any visible effects.

Luther, though he had put a stop to the violent proceedings of Carolostadius, now made open war with the pope and bishops; and, that he might make the people despise their authority as much as much as possible, he wrote one book against the pope's bull, and another against the order falsely called the *order of bishops*. The same year 1522, he wrote a letter, dated July the 29th, to the assembly of the states of Bohemia; in which he assured them that he was labouring to establish their doctrine in Germany, and exhorted them not to return to the communion of the church of Rome: and he published also this year, a translation of the New Testament in the German tongue, which was afterwards corrected by himself and Melancthon. This translation having been printed several times, and being in every body's hands, Ferdinand archduke of Austria, the emperor's brother, made a very severe edict, to hinder the further publication of it; and forbade all the subjects of his imperial majesty to have any copies of it, or of Luther's other books. Some other princes followed his example; and Luther was so angry at it, that he wrote a treatise *Of the secular power*, in which he accuses them of tyranny and impiety. The diet of the empire was held at Nuremberg, at the end of the year; to which Hadrian VI. sent his brief, dated November the 25th: for Leo X. died upon the 2d of December 1521, and Hadrian had been elected pope upon the 9th of January following. In this brief, among other things, he observes to the diet, how he had heard, with grief, that Martin Luther, after the sentence of Leo X. which was ordered to be executed by the edict

of Worms, continued to teach the same errors, and daily to publish books full of heresies: that it appeared strange to him, that so large and so religious a nation could be seduced by a wretched apostate friar: that nothing, however, could be more pernicious to Christendom: and that therefore he exhorts them to use their utmost endeavours to make Luther, and the authors of these tumults, return to their duty; or, if they refuse and continue obstinate, to proceed against them according to the laws of the empire, and the severity of the last edict.

The revocation of this diet was published in the form of an edict, upon the 6th of March 1523; but it had no effect in checking the Lutherans, who still went on in the same triumphant manner. This year Luther wrote a great many pieces: among the rest, one upon the dignity and office of the supreme magistrate; which Frederic elector of Saxony is said to have been highly pleased with. He sent, about the same time, a writing in the German language to the Waldenses, or Pickards, in Bohemia and Moravia, who had applied to him "about worshipping the body of Christ in the eucharist." He wrote also another book, which he dedicated to the senate and people of Prague, "about the institution of ministers of the church." He drew up a form of saying mass. He wrote a piece, entitled, *An example of popish doctrine and divinity*; which Dupins calls a *satire against nuns and those who profess a monastic life*. He wrote also against the vows of virginity, in his preface to his commentary on 1 Cor. viii. And his exhortations here were, it seems, followed with effects: for soon after, nine nuns, among whom was Catharine de Bore, eloped from the nunnery at Nimptschen, and were brought, by the assistance of Leonard Coppen, a burgess of Torgan, to Wittenberg. Whatever offence this proceeding might give to the Papists, it was highly extolled by Luther; who, in a book written in the German language, compares the deliverance of these nuns from the slavery of a monastic life, to that of the souls which Jesus Christ has delivered by his death. This year Luther had occasion to canonize two of his followers, who, as Melchior Adam relates, were burnt at Brussels in the beginning of July, and were the first who suffered martyrdom for his doctrine. He wrote also a consolatory epistle to three noble ladies at Misnia, who were banished from the duke of Saxony's court at Friburg, for reading his books.

In the beginning of the year 1524, Clement VII. sent a legate into Germany to the diet, which was to be held at Nuremberg. Hadrian VI. died in October 1523, and was succeeded by Clement upon the 19th of November. A little before his death he canonized Benno, who was bishop of Meissen in the time of Gregory VII. and one of the most zealous defenders of the holy see. Luther, imagining that this was done directly to oppose him, drew up a piece with this title, *Against the new idol and old devil set up at Meissen*; in which he treats the memory of Gregory with great freedom, and does not spare even Hadrian. Clement VII.'s legate represented to the diet of Nuremberg, the necessity of enforcing the execution of the edict of Worms, which had been strangely neglected by the princes of the empire: but, notwithstanding the legate's solicitations, which were very pressing, the

decrees of that diet were thought for ineffectual, that they were condemned at Rome, and rejected by the emperor. It was in this year that the dispute between Luther and Erasmus, about free-will, began. Erasmus had been much courted by the Papists to write against Luther; but he was all along of opinion, that writing would not be found an effectual way to end the differences and establish the peace of the church. However, tired out at length with the importunities of the pope and the Catholic princes, and desirous at the same time to clear himself from the suspicion of favouring a cause which he would not seem to favour, he resolved to write against Luther, though, as he tells Melancthon, it was with some reluctance, and chose free-will for the subject. His book was intitled *A diatribe, or conference about free-will*; and was written with much moderation, and without personal reflections. He tells Luther in the preface, "That he ought not to take his dissenting from him in opinion ill, because he had allowed himself the liberty of differing from the judgment of popes, councils, universities, and doctors of the church. Luther was some time before he answered Erasmus's book; but at last published a treatise *De servo arbitrio, or Of the servitude of man's will*; and though Melancthon had promised Erasmus, that Luther should answer him with civility and moderation, yet Luther had so little regard to Melancthon's promise, that he never wrote any thing sharper. He accused Erasmus of being careless about religion, and little solicitous what became of it, provided the world continued in peace; and that his notions were rather philosophical than Christian. Erasmus immediately replied to Luther, in a piece called *Hyperaspistes*; in the first part of which he answers his arguments, and in the second his personal reflections.

In October 1524, Luther flung off the monastic habit; which, though not premeditated and designed, was yet a very proper preparative to a step he took the year after; we mean, his marriage with Catharine de Bore. Catharine de Bore was a gentleman's daughter, who had been a nun, and was taken, as we have observed, out of the nunnery of Nimptschen, in the year 1523. Luther had a design, as Melchior Adam relates, to marry her to Glacius, a minister of Ortamunden: but he did not like Glacius; and so Luther married her himself, upon the 13th of June 1525. This conduct of his was blamed not only by the Catholics, but, as Melancthon says, by those of his own party. He was even for some time ashamed of it himself; and owns, that his marriage had made him so despicable, that he hoped his humiliation would rejoice the angels, and vex the devils. Melancthon found him so afflicted with what he had done, that he wrote some letters of consolation to him. It was not so much the marriage, as the circumstances of the time, and the censures passed upon Luther. He married all of a sudden, and at a when Germany was groaning under the miseries of a war, which was said at least to be owing to Lutheranism. Then, again, it was thought an indecent thing in a man of 42 years of age, who was then, as he pretended, restoring the Gospel and reforming mankind, to involve himself in marriage with a woman of 26, either through incontinence, or any account whatever. But Luther, as soon as he had recovered

Luther. covered himself a little from this abashment, assumed his former air of intrepidity, and boldly supported what he had done with reasons. "I took a wife, (says he), in obedience to my father's commands; and hastened the consummation, in order to prevent impediments, and stop the tongues of slanderers." It appears from his own confession, that this reformer was very fond of Mrs de Bore, and used to call her his *Catharine*; which made profane people think and say wicked things of him: "And therefore," says he, "I am married of a sudden, not only that I might not be obliged to hear the clamours which I knew would be raised against me, but to stop the mouths of those who reproached me with *Catharine de Bore*." Luther also gives us to understand, that he did it partly as concurring with his grand scheme of opposing the Catholics.

Luther, notwithstanding, was not himself altogether satisfied with these reasons. He did not think the step he had taken could be sufficiently justified upon the principles of human prudence; and therefore we find him, in other places, endeavouring to account for it from a supernatural impulse. But whether there was any thing divine in it or not, Luther found himself extremely happy in his new state, and especially after his wife had brought him a son. "My rib Kate (says he in the joy of his heart) desires her compliments to you, and thanks you for the favour of your kind letter. She is very well, through God's mercy. She is obedient and complying with me in all things; and more agreeable, I thank God, than I could have expected; so that I would not change my poverty for the wealth of Croesus." He was heard to say, (Seckendorf tells us), that he would not exchange his wife for the kingdom of France, nor for the riches of the Venetians; and that for three reasons: first, Because she had been given him by God, at the time when he implored the assistance of the Holy Ghost in finding a good wife; secondly, Because, though she was not without faults, yet she had fewer than other women: and, thirdly, Because she religiously observed the conjugal fidelity she owed him. There went at first a report, that *Catharine de Bore* was brought to bed soon after her marriage with Luther; but Erasmus, who had wrote that news to his friends, acknowledged the falsity of it a little after.

His marriage, however, did not retard his activity and diligence in the work of reformation. He revised the Augsburg confession of faith, and apology for the Protestants, when the Protestant religion was first established on a firm basis. See PROTESTANTS and REFORMATION.

After this, Luther had little else to do than to sit down and contemplate the mighty work he had finished; for that a single monk should be able to give the church so rude a shock, that there needed but such another entirely to overthrow it, may very well seem a mighty work. He did indeed little else: for the remainder of his life was spent in exhorting princes, states, and universities, to confirm the reformation which had been brought about thro' him; and publishing from time to time such writings as might encourage, direct, and aid them in doing it. The emperor threatened temporal punishment with armies, and the pope eternal with bulls and anathe-

mas; but Luther cared for none of their threats. His friend and coadjutor Melancthon was not so indifferent; for Melancthon had a great deal of softness, moderation, and diffidence in his make, which made him very uneasy, and even sorrowful, in the present disorders. Hence we find many of Luther's letters written on purpose to support and comfort him under these several distresses and anxieties.

In the year 1533, Luther wrote a consolatory epistle to the citizens of Olschatz, who had suffered some hardships for adhering to the Augsburg confession of faith; in which, among other things, he says: "The devil is the host, and the world is his inn; so that wherever you come, you shall be sure to find this ugly host." He had also about this time a terrible controversy with George duke of Saxony, who had such an aversion to Luther's doctrine, that he obliged his subjects to take an oath that they would never embrace it. However, 60 or 70 citizens of Leipzig were found to have deviated a little from the Catholic way in some point or other, and they were known previously to have consulted Luther about it; upon which George complained to the elector John, that Luther had not only abused his person, but also preached up rebellion among his subjects. The elector ordered Luther to be acquainted with this; and to be told at the same time, that if he did not clear himself of the charge, he could not possibly escape punishment. But Luther easily refuted the accusation, by proving, that he had been so far from stirring up his subjects against him, on the score of religion, that, on the contrary, he had exhorted them rather to undergo the greatest hardships, and even suffer themselves to be banished.

In the year 1534, the Bible translated by him into German was first printed, as the old privilege, dated at Bibliopolis, under the elector's hand, shows; and it was published the year after. He also published this year a book against masses and the consecration of priests, in which he relates a conference he had with the devil upon those points; for it is remarkable in Luther's whole history, that he never had any conflicts of any kind within, but the devil was always his antagonist. In February 1537, an assembly was held at Smalkald about matters of religion, to which Luther and Melancthon were called. At this meeting Luther was seized with so grievous an illness, that there were no hopes of his recovery. He was afflicted with the stone, and had a stoppage of urine for 11 days. In this terrible condition he would needs undertake to travel, notwithstanding all that his friends could say or do to prevent him; his resolution, however, was attended with a good effect; for the night after his departure, he began to be better. As he was carried along, he made his will, in which he bequeathed his detestation of Popery to his friends and brethren; agreeably to what he often used to say: *Pessis eram vivus, moriens ero mors tua, papa*; that is, "I was the plague of Popery in my life, and shall continue to be so in my death."

This year the Pope and the court of Rome, finding it impossible to deal with the protestants by force, began to have recourse to stratagem. They affected therefore to think, that though Luther had indeed carried things on with a high hand and to a violent extreme,

Luther.

yet what he had pleaded in defence of these measures was not entirely without foundation. They talked with a seeming show of moderation; and Pius III. who succeeded Clement VII. proposed a reformation first among themselves, and even went so far as to fix a place for a council to meet at for that purpose. But Luther treated this farce as it deserved to be treated; unmasked and detected it immediately; and, to ridicule it the more strongly, caused a picture to be drawn, in which was represented the pope seated on high upon a throne, some cardinals about him with foxes tails on, and seeming to evacuate upwards and downwards, (*sursum deorsum repurgare*, as Melchior Adam expresses it.) This was fixed over-against the title-page, to let the readers see at once the scope and design of the book; which was, to expose that cunning and artifice with which those subtle politicians affected to cleanse and purify themselves from their errors and superflitions. Luther published about the same time a confutation of the pretended Grant of Constantine to Sylvester bishop of Rome; and also some letters of John Hufs, written from his prison at Constance, to the Bohemians.

In this manner was Luther employed till his death, which happened in the year 1546. That year, accompanied by Melancthon, he paid a visit to his own country, which he had not seen for many years, and returned again in safety. But soon after, he was called thither again by the earls of Mansfeldt, to compose some differences which had arisen about their boundaries. Luther had not been used to such matters; but because he was born at Ilsben, a town in the territory of Mansfeldt, he was willing to do his country what service he could, even in this way. Preaching his last sermon therefore at Wittemberg, upon the 17th of January, he set off on the 23d; and at Hall in Saxony lodged with Justus Jonas, with whom he stayed three days, because the waters were out. Upon the 28th, he passed over the river with his three sons and Dr Jonas; and being in some danger, he said to the Doctor, "Do not you think it would rejoice the devil exceedingly, if I and you, and my three sons, should be drowned?" When he entered the territories of the earls of Mansfeldt, he was received by 100 horsemen, or more, and conducted in a very honourable manner; but was at the same time so very ill, that it was feared he would die. He said, that these fits of sickness often came upon him, when he had any great business to undertake: of this, however, he did not recover; but died upon the 18th of February, in the 63d year of his age. A little before he expired, he admonished those that were about him to pray to God for the propagation of the Gospel; "because, (said he), the council of Trent, which had sat once or twice, and the pope, would devise strange things against it." Soon after, his body was put into a leaden coffin, and carried with funeral pomp to the church at Ilsben, when Dr Jonas preached a sermon upon the occasion. The earls of Mansfeldt desired that his body should be interred in their territories; but the elector of Saxony insisted upon his being brought back to Wittemberg: which was accordingly done; and there he was buried with the greatest pomp that perhaps ever happened to any private man. Princes, earls, nobles, and students without number, attended the procession; and Melancthon made his funeral oration.

VOL. VI.

Luther,  
Luther-  
nim.

A thousand lies were invented by the Papists about Luther's death. Some said that he died suddenly; others, that he killed himself; others, that the devil strangled him; others, that his corpse stunk so abominably, that they were forced to leave it in the way, as it was carried to be interred. Nay, lies were invented about his death, even while he was yet alive. Luther, however, to give the most effectual refutation of this account of his death, put forth an advertisement of his being alive; and, to be even with the Papists for the malice they had shown in this lie, wrote a book at the same time to prove, that "the papacy was founded by the devil."

Luther's works were collected after his death, and printed at Wittemberg in 7 vols folio. Catharine de Bore survived her husband a few years; and continued the first year of her widowhood at Wittemberg, tho' Luther had advised her to seek another place of residence. She went from thence in the year 1547, when the town was surrendered to the emperor Charles V. Before her departure, she had received a present of 50 crowns from Christian III. king of Denmark; and the elector of Saxony, and the counts of Mansfeldt, gave her good tokens of their liberality. With these additions, to what Luther had left her, she had wherewithal to maintain herself and her family handsomely. She returned to Wittemberg, when the town was restored to the elector; where she lived in a very devout and pious manner, till the plague obliged her to leave it again in the year 1552. She sold what she had at Wittemberg; and retired to Torgau, with a resolution to end her life there. An unfortunate mischance befel her in her journey thither, which proved fatal to her. The horses growing unruly, and attempting to run away, she leaped out of the vehicle she was conveyed in; and, by leaping, got a fall, of which she died about a quarter of a year after, at Torgau, upon the 20th of December 1552. She was buried there in the great church, where her tomb and epitaph are still to be seen; and the university of Wittemberg, which was then at Torgau because the plague raged at Wittemberg, made a public programme concerning the funeral pomp.

LUTHERANISM, the sentiments of Martin Luther with regard to religion.

Lutheranism has undergone some alterations since the time of its founder.—Luther rejected the epistle of St James, as inconsistent with the doctrine of St Paul, in relation to justification; he also set aside the apocalypse: both which are now received as canonical, in the Lutheran church.

Luther reduced the number of sacraments to two, viz. baptism, and the eucharist: but he believed the impanation, or consubstantiation, that is, that the matter of the bread and wine, remain with the body and blood of Christ; and it is in this article that the main difference between the Lutheran and English churches consists.

Luther maintained the mass to be no sacrifice; exploded the adoration of the host, auricular confession, meritorious works, indulgences, purgatory, the worship of images, &c. which had been introduced in the corrupt times of the Romish church. He also opposed the doctrine of free will, maintained predestination, and asserted our justification to be solely by the

imputation of the merits and satisfaction of Christ. He also opposed the fallings in the Romish church, monastic vows, the celibate of the clergy, &c.

**LUTHERANS**, the Christians who follow the opinions of Martin Luther, one of the principal reformers of the church in the 16th century. See **LUTHER**.

**LUTHERN**, in architecture, a kind of window over the cornice, in the roof of a building; standing particularly over the naked of a wall, and serving to illuminate the upper story.

Lutherns are of various forms, as square, semicircular, round, called *bull's eyes*, *flat arches*, &c.

**LUTRA**, in zoology. See **MUSTELA**.

**LUTTI** (Beneditto), an eminent painter, born at Florence in 1666. He was the disciple of Antonio Dominico Gabiani, and his merit was judged equal to that of his master: he painted few beside easel-pieces; and his works were much valued and sought for in England, France, and Germany. The emperor knighted him; and the elector of Mentz, together with his patent of knighthood, sent him a cross set with diamonds. Lutti was never satisfied in finishing his pictures; yet tho' he often retouched them, they never appeared laboured. He died in 1724.

**LUTZEN**, a town of Upper Saxony, in Germany; famous for a battle fought here in 1632, when Gustavus Adolphus king of Sweden was killed. It is situated on the river Elster, in E. Long. 12. 37. N. Lat. 51. 20.

**LUXATION**, is when any bone is moved out of its place or articulation, so as to impede or destroy its proper office or motion. See **SURGERY**.

**LUXEMBURG**, a city of the Austrian Netherlands, and capital of a duchy of the same name. It is seated partly on a hill, and partly on a plain; but is very strong, both by art and nature. It is but indifferently built, though there are some good stone houses in it. There is nothing very remarkable among the structures but the Jesuits church; which is a handsome edifice, after the modern taste. It was taken by Lewis XIV. in 1684; who so augmented the fortifications, that it is now one of the strongest towns in Europe. It was ceded to Spain by the treaty of Ryfwick; but the French took it again in 1701, and gave it up to the house of Austria by the treaty of Utrecht. It is 25 miles south-west of Treves, and 100 west of Mentz. E. Long. 6. 10. N. Lat. 49. 52.

**LUXEMBURG**, the duchy of, is one of the 17 provinces of the Netherlands. It is bounded on the east by the archbishoprick of Treves; on the south, by Lorrain; on the west, partly by Champagne, and partly by the bishoprick of Liege, which likewise, with part of Limburg, bound it on the north. It lies in the forest of Ardenne, which is one of the most famous in Europe. In some places it is covered with mountains and woods, and in general it is fertile in corn and wine; and here are a great number of iron-mines. The principal rivers are, the Moselle, the Sour, the Ourte, and the Semoy. It belongs partly to the house of Austria, and partly to the French; and Thionville is the capital of the French part.

**LUXEMBURG** (François Henry de Montmorency) duke of, and marshal of France, a renowned general in the service of Lewis XIV. was born in 1628. He was with the prince of Conde at the battle of Ro-

croy, in 1643; and in 1668 distinguished himself at the conquest of Franche Comté. In 1672, he commanded in chief the French army in Holland; when he defeated the enemy near Woerden and Bodegrave, and was universally admired for the fine retreat he made in 1673. He became marshal of France in 1675; gained the battle of Fleurus in 1690, that of Steenkirk in 1692, and that of Nerwind in 1693. He died at Versailles, in 1695.

**LUXURIANS FLOS**, "a luxuriant or double flower;" a flower, some of whose parts are increased in number, to the diminution or entire exclusion of others.

The parts that are augmented or multiplied in luxuriant flowers, are the flower-cup and petals, which Linnæus considers as the teguments or covers of the flower; the parts that are diminished, or entirely excluded, are the stamina or chives, which the same author denominates the male organs of generation.

Luxuriance in flowers is capable of the three following varieties.

1. A flower is said to be **MULTIPLIED**, (*flos multiplicatus*), when the increase of the petals is not such as to exclude all the stamina: in this sense, flowers are properly said to be double, triple, or quadruple, according to the number of multiplications of the petals.

2. A flower is said to be **FULL**, (*flos plenus*), when, by the multiplication of the petals, all the stamina are excluded. Such are most of the double flowers that engage the attention of florists.

3. A flower is said to be **PROLIFIC**, (*flos prolifer*), which produces flowers, and sometimes leaves, from its centre.

For a particular description of each of these kinds of luxuriance in flowers, see the articles **MULTIPLICATUS FLOS**, **PLENUS FLOS**, and **PROLIFER FLOS**.

Many natural orders of plants do not in any circumstances produce luxuriant flowers. Of this kind are the masked-flowers of Tournefort, excepting calve's-snout; the rough-leaved, umbelliferous, starry-plants, and such as flower at the joints, of Ray: some umbelliferous flowers, however, are *prolific*.

The pea-bloom or butterfly-shaped flowers are rarely rendered double; some instances, however, of luxuriance, are observed in a species of ladies-finger, coronilla, and broom.

All luxuriant flowers are vegetable monsters. Such as are perfectly full, by which we mean the greatest degree of luxuriance, cannot be propagated by seeds; because these, for want of impregnation, can never ripen. Full flowers, therefore, are very properly denominated by Linnæus, *castrati*. This highest degree of luxuriance is very common in carnation, lychnis, anemone, stock, Indian cress, rose, marsh marigold, ranunculus, violet, peony, and narcissus.

Flowers which do not exclude all the stamina, perfect their seeds. Of this kind are poppy, fennel-flower, campanula, and some others.

Some flowers, as those of the water-lily, fig-marigold, and cactus, have many rows or series of petals, without the number of stamina being in the least diminished. Such flowers are by no means to be reckoned luxuriant, in the slightest degree.

Luxuriance in flowers is generally owing to excess of nourishment.

**LUXURY**;

**LUXURY**; voluptuousness, or an extravagant indulgence in diet and dress.

Concerning the general utility of luxury to a state, there is much controversy among the political writers. Baron Montequieu lays it down, that luxury is necessary in monarchies, as in France; but ruinous to democracies, as in Holland. With regard therefore to Britain, whose government is compounded of both species, it may still be a dubious question, how far private luxury is a public evil; and, as such, cognizable by public laws. And indeed our legislators have several times changed their sentiments as to this point: for formerly there were a number of penal laws existing, to restrain excess in apparel; chiefly made in the reigns of Edward III. IV. and Henry VIII. against picked shoes, short doublets, and long coats; all of which were repealed by statute 1 Jac. I. c. 25. But, as to excess in diet, there still remains one ancient statute unrepealed, 10 Edw. III. ft. 3. which ordains, that no man shall be served, at dinner or supper, with more than two courses; except upon some great holidays there specified, in which he may be served with three.

**LYBIA**, or **LIBYA**, a name anciently given to all that part of Africa lying between the border of Egypt and the river Triton; and comprehending *Cyrenaica*, *Marmarica*, and the *Regio Syrtica*. See these articles.

**LYCÆUM**, in Grecian antiquity, an academy situated on the banks of the Ilissus at Athens. It was composed of porticoes and walks, where Aristotle taught philosophy; walking there constantly every day till the hour of anointing, whence he and his followers had the name of *Peripatetics*.

**LYCÆUS**, (anc. geog.), a mountain of Arcadia, sacred to Jupiter; whence *Jupiter Lycaeus*, (Pliny.) Sacred also to Pan, (Virgil): and hence *Lycaea*, the rites performed to Pan on this mountain; which Evander carrying with him to Latium, were called *Lupercalia*, (Virgil).

**LYCAONIA**, (anc. geog.) a small country of the Hither Asia, contained between Pamphylia to the south, Cappadocia to the north, Pisidia and Phrygia to the west, and Armenia Minor to the east. *Lycaones*, the people. This country, tho' situated very near mount Taurus, and part of it on it, yet the Romans reckoned it to Asia intra Taurum. *Arcadia*, anciently called *Lycaonia*, (Stephanus.) Also an island in the Tiber, joined to Rome by a bridge, and to the land by another, namely, the Cestius and Fabricius.

**LYCHNIS**, **CAMPION**, including also the bachelor's button, catch-fly, &c.; a genus of the pentagynia order, belonging to the decandria class of plants.

*Species*, &c. 1. The Chalcedonica, or Chalcedonian scarlet lychnis, hath a fibrated perennial root; upright, straight, hairy, annual stalks, rising three or four feet high; garnished with long, spear-pointed, close-fitting leaves, by pairs opposite; and the stalk crowned by a large, compact, flat bunch of beautiful scarlet or flame-coloured flowers, appearing in June and July. Of this there are varieties, with single scarlet flowers, with large double scarlet flowers, of exceeding beauty and elegance, with pale-red flowers, and with white flowers. Of these varieties, the dou-

ble scarlet lychnis is superior to all for size and elegance: the flowers being large, very double, and collected into a very large bunch, exhibit a charming appearance; the single scarlet kind is also very pretty; and the others effect an agreeable variety with the scarlet kinds. 2 The diœcia, or diœcious lychnis, commonly called *bachelors-button*, hath fibrated perennial roots; upright stalks, branching very diffuse and irregular, two or three feet high; having oval, acute-pointed, rough leaves, by pairs opposite; and all the branches terminated by clusters of diœcious flowers of different colours and properties in the varieties; flowering in April and May. The varieties, are the common single red-flowered bachelors button, double red, double white, and single white-flowered. The double varieties are exceedingly ornamental in their bloom; the flowers large, very double, and continue long in blow; the single red sort grows wild by ditch sides and other moist places in many parts of England; from which the doubles were accidentally obtained by culture in gardens. The flowers are often diœcious, *i. e.* male and female on distinct plants. 3 The viscaria, or viscous German lychnis, commonly called *catch-fly*, hath fibry perennial roots; crowned by a tuft of long, grassy leaves close to the ground; many erect, straight, single stalks, rising a foot and a half or two feet high, exuding from their upper part a viscous or clammy matter; garnished with long narrow leaves, by pairs opposite; and terminated by many reddish-purple flowers, in clusters one above another, forming a sort of long loose spike; all the flowers with entire petals; flowering in May. Of this also there are varieties, with single red flowers, with double red flowers, and with white flowers. The double variety is considerably the most eligible for general culture, and is propagated in plenty by parting the roots. All the varieties of this species emitting a glutinous liquid matter from their stalks, flies happening to light thereon sometimes stick and entangle themselves, whence the plant obtain the name *Catch-fly*. 4. The flos-cuculi, cuckoo-flower lychnis, commonly called *ragged-robin*, hath fibry perennial roots; upright, branchless, channelled stalks, rising near two feet high; garnished with long, narrow, spear-shaped leaves, in pairs opposite; and terminated by branchy foot-stalks, sustaining many purple, deeply quadrifid flowers; appearing in May. The flowers having each petal deeply quadrifid in a torn or ragged-like manner, the plant obtained the cant name of *Ragged-robin*. There are varieties with single flowers and double flowers. The double sort is a large, very multiple, fair flower: it is an improved variety of the single, which grows wild in most of our moist meadows, and is rarely cultivated; but the double, being very ornamental, merits culture in every garden. All the four species and respective varieties are very hardy; all fibrous-rooted, the roots perennial; but are annual in stalks, which rise in spring, flower in summer, succeeded in the singles by plenty of seed in autumn, by which all the single varieties may be raised in abundance, but the doubles only by dividing the roots, and some by cuttings of the flower-stalks.

**LYCODYNTES**, in natural history, the petrified

Lycopod-  
don.

teeth of the lupulus-pifcia, or wolf-fish, frequently found foſſile. They are of different ſhapes; but the moſt common kind riſe into a femiorbicular form, and are hollow within, ſomewhat reſembling an acorn-cup: this hollow is found ſometimes empty, and ſometimes filled with the ſtratum in which it is immerſed. Many of them have an outer-circle, of a different colour from the reſt.

LYCOPERDON, in botany; a genus of the order of fungi, belonging to the cryptogamia claſs of plants. There are ten ſpecies, of which the following are the moſt remarkable. 1. The tuber, truſſes, or ſubterraneous puff-balls, is a native of woods both in Scotland and England. It is a ſubterraneous fungus, growing generally in cluſters three or four inches under ground, without any viſible root. The figure of it is nearly ſpherical, the ſize that of a potatoe; the exterior coat at firſt white, afterwards black, and ſtudded with pyramidal or polyhedrous tubercles; the internal ſubſtance ſolid and callous, of a dirty-white or pale-brown colour, grain'd like a nutmeg with ſerpentine lines; in which, according to Micheli, are imbedded minute oval capſules, containing each from two to four round warted ſeeds. The truſſes of Great Britain ſeldom exceed three or four ounces in weight; but in Italy, and ſome other parts of the continent, they are ſaid to have been found of the enormous ſize of eight and even 14 pounds. They are received at our tables, either freſh and roaſted like potatoes, or dried and ſliced into ragouts. They have a volatile and ſomewhat urinous ſmell, and are reputed to be aphrodiſiacal. Dogs are with much pains taught to hunt for them by the ſcent, and to ſcratch up the ground under which they lie.

2. The boviſta, or common puff-ball, is frequent in meadows and paſtures in the autumn. It varies exceedingly in ſize, figure, ſuperficies, and colour. In general, it conſiſts of a ſack or bag, having a root at its baſe, and the bag compoſed of three membranes, an epidermis, a tough white ſkin, and an interior coat which adheres cloſely to the central pith. The pith in the young plants is of a yellowiſh colour, at firſt firm and ſolid, but ſoon changes into a cellular ſpongy ſubſtance, full of a dark dull-green powder, which diſcharges itſelf through an aperture at the top of the fungus, which aperture is formed of lacerated ſegments, in ſome varieties reflexed. The powder is believed to be the ſeeds, which through a microſcope appear of a ſpherical form, and to be annexed to elaſtic hairs. See *Haller's Hiſt. Helvet. n.* 2172.

Among the numerous varieties of this fungus, the glabrum is moſt remarkable. It is a ſmooth ſeſſile kind, of a nearly ſpherical form, puckered or contracted at the root. This ſometimes grows to an enormous ſize. It has been found in England as big as a man's head; and at Carraria, near Padua in Italy, ſpecimens have been gathered, weighing 25 pounds, and meaſuring two yards in circumference: but its more ordinary ſize is that of a walnut or an apple.

The varieties of this ſpecies have no limits, being frequently found to run into one another; the ſcaly, warty, and echinated coats turning ſmooth as the plants grow old, and the neck of the fungus having no determinate length. The natural colour of the

Lycopod-  
dium.

puff-ball is either white, grey, or aſh-coloured: but it ſometimes found yellowiſh, tawny, and browniſh. The internal ſpongy part of it, bound on to wounds, is eſteemed good to ſtop bleedings. Preſſed and dried in an oven, the puff-ball becomes a kind of tinder, the ſmoke of which is ſaid to intoxicate bees. See *Gent. Mag.* July 1766. The Italians fry the great variety, and indeed any of the others when young, and eat them with ſalt and oil, according to the relation of Marſigli.

LYCOPODIUM, or CLUB-MOSS; a genus of the order of muſci, belonging to the cryptogamia claſs of plants. There are 24 ſpecies; of which the following are the moſt remarkable. 1. The *clavatum*, or common club-moſs, is common in dry and mountainous places, and in fir forests. The ſtalk is proſtrate, branched, and creeping, from a foot to two or three yards long; the radicles woody. The leaves are numerous, narrow, lanceolate, acute, often incurved at the extremity, terminated with a long white hair, and every-where ſurround the ſtalk. The peduncles are erect, firm, and naked (except being thinly ſet with lanceolate ſcales); and ariſe from the ends of the branches. They are generally two or three inches long, and terminated with two cylindrical yellowiſh ſpikes, imbricated with oval-acute ſcales, finely lacerated on the edges, and ending with a hair. In the *ala* or boſom of each ſcale is a kidney ſhaped capſule, which burſts with elaſticity when ripe, and throws out a light yellow powder, which, blown into the flame of a candle, ſhakes with a ſmall exploſion. The Swedes make mats of this moſs to rub their ſhoes upon. In Ruſſia, and ſome other countries, the powder of the capſules is uſed in medicine to heal galls in children, chops in the ſkin, and other ſores. It is alſo uſed to powder over official pills, and to make artificial lightning at theatres. The Poles make a decoction of the plant, and, dipping a linen cloth into it, apply it to the heads of perſons afflicted with the diſeaſe called the *plica polonica*, which is ſaid to be cured by this kind of fomentation.

2. The *ſelago*, or fir club-moſs, is common in the Highland mountains of Scotland, and in the Hebrides. The ſtalk at the baſe is ſingle and reclining; but a little higher is divided into upright dichotomous branches, from two to ſix inches high, ſurrounded with eight longitudinal oblique ſeries of lanceolate, ſmooth, rigid, imbricated leaves. Near the ſummits of the branches, in the *alc* of the leaves, are placed ſingle kidney ſhaped capſules, conſiſting of two valves, and caſt out a fine yellow powder. Theſe capſules Linnaeus ſuppoſes to be *antheræ*, or male parts of fructification. In the *alc* alſo of many of the leaves, near the tops of the branches, are often found what the ſame great author calls *female flowers*, but which the ingenious Haller eſteems to be only gems or buds of a future plant. They conſiſt, firſt, of four ſtiff, lanceolate, incurved, minute leaves, one of the outermoſt longer and larger than the reſt. Theſe are ſuppoſed to correſpond to the *calyx* in regular flowers. Again, at the bottom of this *calyx*, are five ſmall pellucid ſubſtances reſembling leaves, viſible only by a microſcope, which are ſuppoſed analogous to piſtils. Theſe, in time, grow up into three large broad leaves,

Lycophron  
the  
Lydgate.

two of the five united together like the hoof of an ox; with a third narrower one annexed at the base, and two other minute ones opposite to the other three. These five leaves are joined at the base; and in autumn, falling from the *calyx*, vegetate, and produce a new plant. See a dissertation *De feminibus muscorum, Amenit. Academ. II. p. 261.* In the island of Raafay, near Sky, in Ross-shire, and some other places, the inhabitants make use of this plant instead of alum, to fix the colours in dyeing. The Highlanders also sometimes take an infusion of it as an emetic and cathartic: but it operates violently; and, unless taken in a small dose, brings on giddiness and convulsions. Linnæus informs us, that the Swedes use a decoction of it to destroy lice on swine and other animals.

LYCOPHRON, a famous Greek poet and grammarian, born at Colchis in Eubœa, flourished about 304 B. C. and, according to Ovid, was killed by an arrow. He wrote 20 tragedies; but all his works are lost, except a poem intitled *Cassandra*, which contains a long train of predictions, which he supposes to have been made by Cassandra, Priam's daughter. This poem is extremely obscure. The best edition of it is that of Dr Potter, printed at Oxford, in 1697, folio.

LYCURGUS, the celebrated legislator of the Spartans, was the son of Eunomes king of Sparta. —He travelled to Greece, to the isle of Crete, to Egypt, and even to the Indies, to converse with the sages and learned men of those countries, and to learn their manners, their customs, and their laws. After the death of his brother Polydictes, who was king of Sparta, his widow offered the crown to Lycurgus, promising that she would make herself mistress of the child of which she was pregnant, provided he would marry her; but Lycurgus nobly refused these advantageous offers, and afterwards contented himself with being tutor to his nephew Charillus, and restored to him the government when he came of age: but notwithstanding this regular and generous conduct, he was accused of a design to usurp the crown. This calumny obliged him to retire to the island of Crete, where he applied himself to the study of the laws and customs of nations. At his return to Lacedæmon, he reformed the government: and, to prevent the disorders occasioned by luxury and the love of riches, he prohibited the use of gold and silver; placed all the citizens in a state of equality; and introduced the strictest temperance, the most exact discipline, and those admirable laws, which (a few excepted) have been celebrated by all historians. It is said, that, to engage the Lacedæmonians to observe them inviolably, he made them promise with an oath not to change any part of them till his return; and that he afterwards went to the island of Crete, where he killed himself, after having ordered that his ashes should be thrown into the sea, for fear lest if his body should be carried to Sparta the Lacedæmonians would think themselves absolved from their oath. He flourished about 870 B. C.

LYDGATE (John), called *the Monk of Bury*; not, as Cibber conjectures, because he was a native of that place, for he was born about the year 1380, in the village of Lydgate; but because he was a monk of the Benedictine convent at St Edmund's-Bury.

After studying some time in our English universities, he travelled to France and Italy; and, having acquired a competent knowledge of the languages of those countries, he returned to London, where he opened a school, in which he instructed the sons of the nobility in polite literature. At what time he retired to the convent of St Edmund's-Bury, does not appear; but he was certainly there in 1415. He was living in 1446, aged about 66; but in what year he died, is not known. Lydgate, according to Pits, was an elegant poet, a persuasive rhetorician, an expert mathematician, an acute philosopher, and a tolerable divine. He was a voluminous writer; and, considering the age in which he lived, an excellent poet. His language is less obsolete, and his versification much more harmonious, than the language and versification of Chaucer, who wrote about half a century before him. He wrote, 1. History of the Theban war, printed at the end of Chaucer's works, 1561, 1602, 1687. 2. Poematisation of good counsel; at the end of Chaucer's works. 3. The life of Hector; London 1594, fol. printed by Gros, dedicated to Henry V. 3. Life of the Blessed Virgin; printed by Caxton. 4. The proverbs of Lydgate upon the fall of princes; printed by Winck. Word. Lond. .... 4to. 5. Dispute of the horse, the sheep, and the goose; printed in Caxton's Collect. 4to. 6. The temple of brass; among the works of Chaucer. 7. London lickeny; vide Stow's history, &c. &c. Besides an incredible number of other poems and translations preserved in various libraries, and of which the reader will find a catalogue in bishop Tanner.

LYDIA (anc. geogr.), the same with ΜΑΩΝΙΑ; though some reckoned this last only a part, by the name of *Lydia Superior*, (Callimachus, Pausanias); inhabited by the people called *Meones*, (Strabo); *Meones*, (Homer, Dionysius Periegetes); the *Lower Lydia*, or that towards the sea-coast, being inhabited by the *Lydi*. Thus the case anciently stood; though not so constantly, but that those towards the Lower Lydia were called *Meones*; and *Lydi*, those towards the Higher. Afterwards, the colony of the Ionians prevailing, and the name *Meones* becoming gradually to cease, the lower part came to be called *Ionia*, the name *Lydia* being appropriated to the higher. This latter had Ionia on the west, Phrygia on the east, Mysia to the north, and Caria to the south. In Cræsus's time, the kingdom of Lydia extended from the Halys on the east, to the Egean sea on the west side. *Lydi*, the people, descendants of Lud, the son of Shem. They were the first who coined gold and silver, (Herodotus); were called *Mali*, from their vicious character, (Athenæus); prostituted their daughters, (Herodotus, Horace); anciently a brave people, all excellent horsemen, (idem); *Lydius*, the epithet. *Lydius mos*, denotes effeminacy.

LYDYAT (Thomas), a learned English divine, born in 1572, and educated at Oxford. About the year 1609, he became acquainted with Dr James Usher, afterwards archbishop of Armagh, who carried him to Ireland. He was at Dublin college for about two years, after which he returned to England; and the rectory of Alkington becoming vacant, he was presented to it: but at length, being engaged for the debts of a near relation, which for the present he was unable.

Lydia,  
Lydyat.

Lydius  
Lymph.

unable to pay, having before spent his patrimony in printing several books, he was sent to prison; and was confined at Oxford, in the King's-bench, and elsewhere, till Sir William Boswell, a generous patron of learned men, Dr Robert Pink, warden of New-college, bishop Usher, and Dr Laud, discharged the debt. In the civil wars, he suffered much in his rectory of Alkington from the parliament-party; was four times pillaged to the value of at least 70l.; and was forced for a quarter of a year together to borrow a shirt to shift himself. He died in 1646. He wrote some pieces in English, and many works in Latin, on chronology and natural history.

LYDIUS LAPIS, in the natural history of the ancients; the name of the stone used by way of touch-stone for the trial of gold and silver, and called by some *Heraclius Lapis*; both of which names were also applied by the ancients to the load-stone, and hence has arisen no small misunderstanding of their works. Pliny has observed, that both the load-stone and touch stone were at times called *Lydius* and *Heraclius Lapis*.

The true *lapis Lydius*, or the touch-stone, was anciently found only in the river Tmolus; but was afterwards found in many other places, and is now very common in many of the German rivers. The ancients give us very remarkable and circumstantial accounts of the uses they made of it; and it is plain they were able to discern the alloys of gold by means of it with very great exactness. We at present use several different stones under this name, and for the same purpose. In Italy, a green marble called *verdello*, is most frequently used; and with us, very frequently small pieces of the *basalt*, the same with that vast piece of black marble called the *Giant's Causeway* in Ireland. See *BASALTES*; *GIANT'S Causeway*; *ICELAND*, n° 9; *STAFFA*; and *VOLCANO*.

LYING-IN-WOMEN. See *MIDWIFERY*.

LYING-TO, or *Lying-By*, the situation of a ship, when she is retarded in her course, by arranging the sails in such a manner as to counteract each other with nearly an equal effort, and render the ship almost immoveable, with respect to her progressive motion, or head-way. A ship is usually brought-to by the main and fore-top sails, one of which is laid aback, whilst the other is full; so that the latter pushes the ship forward, whilst the former resists this impulse by forcing her astern. This is particularly practised in a general engagement, when the hostile fleets are drawn up in two lines of battle opposite each other. It is also used to wait for some other ship, either approaching or expected; or to avoid pursuing a dangerous course, especially in dark or foggy weather, &c.

LYME, a sea-port town of Dorsetshire, in England, seated on the sea-shore, with a good harbour. It is so called from a little river which runs through the middle of the town, and falls into the sea. It is a large well-built corporation town, is a place of good trade, and sends two members to parliament. The duke of Monmouth landed here with a handful of men in 1685, which were soon increased to 6000, and was then proclaimed king; but he was defeated by king James's army, taken prisoner, and beheaded. W. Long. 3. 5. N. Lat. 50. 40.

LYMPH, a fine colourless fluid, separated in the

body from the mass of blood, and contained in peculiar vessels called *lymphatics*.

The late ingenious Mr Hewson published a dissertation on the lymph and lymphatic system in the human body, and that of other animals. The lymph he considers both as contained in its proper vessels, and exhaled into the different cavities of the body. In each of these states, the lymph coagulated when exposed to the air, and seemed more to resemble the buffy coat of the blood than its watery parts, to which it hath been compared by authors. This coagulum, Mr Hewson found to vary considerably in its degree of cohesion, being always firm in strong animals, but in weak ones of a much looser texture. And, in the course of his experiments, he observed, that the fluid collected from the different cavities of the body uniformly agreed with that found in the lymphatic vessels of the same animal, both in degree of tenacity, and time of coagulation. Thus far these fluids correspond with the coagulable part of blood; but they differ from it in the time necessary to form the coagulum, the blood always jelling much sooner than the lymph, and later in strong than in weak animals; the very reverse of what happens to that fluid.

From the following observations, Mr Hewson is of opinion, that the vessels exhaling fluids into the cavities of the body, whatever their structure may be, have a power of changing the nature of their contents.

1. A coagulum is often found covering the internal surface of inflamed cavities, without the smallest erosion. This can only be the natural exhalation, thrown out by inflamed vessels, with a strong disposition to coagulate.

2. As the lymph is discharged, variously changed in tenacity and other properties, by disease; and as pus is sometimes found in the same manner in cavities, without any ulceration; the author thinks it at least probable, that this purulent matter is only the lymph itself, still more altered by flowing through vessels in a higher or different degree of inflammation; and in this notion he is confirmed, by observing, with the microscope, globules in pus like those of the milk, a secreted liquor.

On a review of his experiments, he thinks they evidently point out the following general conclusions: that the lymph and exhalations are of a similar nature, but differ widely from the watery part of the blood; that they coagulate on exposure to air, and are probably a species of the lymph of the blood; that they differ in the time and firmness of coagulation, in various degrees, from the caustic habit, where they scarcely jelly at all, to the inflammatory, where very short time is requisite to a strong cohesion; and that, in some cases, the inflamed vessels can even convert the fluid passing through them into real purulent matter.

Having thus given a correct idea of the properties of the lymph, he goes on to trace it from the circulating mass, and to investigate the manner of its separation; with regard to which, he observes, two different opinions have been entertained. The first and most general is, that the lymph is poured into cavities, either by exhalant arteries, or pores of an organized nature on the sides of vessels. The other has lately been started by Dr Hunter, who considers the lymph as merely a transudation of the thinner parts of the blood through

Lymph.

Lymph.

Lymph.

through interfaces or inorganized pores in the vessels circulating the red-blood; which, tho' they retain the serum, allow the more fluid parts to pass with ease. In support of this new doctrine, Dr Hunter adduces the following facts.

1. Water injected into the blood-vessels of a dead animal readily imitates this transudation.

2. Blood itself transudes after death, the lymph to which it owed its consistence being coagulated.

3. Bile transudes through the gall-bladder; for, on opening an animal, all the adjacent parts are tinged.

With a view to disprove this notion, Mr Hewson maintains, that there is a tension in the vessels of a living body, forsaking them with life; and that, did such an exudation take place, it would defeat one great intention of vessels, the conveyance of fluids, and involve us in a continual round of exhalation and absorption, very contrary to the common simplicity of nature.

A second objection of Mr Hewson is, that, if liquids thus filtrate into cavities, not only must the vessels, creeping on their sides, but the membranes lining these cavities, be porous. But, if these pores are admitted in every part, we cannot deny them to the whole extent of these membranes. And, were this the case, a partial dropsy could never occur; as a fluid would as easily escape, from within, outwards, as it formerly infiltrated itself from the vessels into any cavity.

Another argument against the opinion of Dr Hunter, is, drawn by Mr Hewson from his former experiment, where he found the lymph, in different states of the body, so various in degree of viscosity. He is at a loss to conceive, how pores of an inorganized nature should pour out fluids so different in consistence, much less filtrate pus from the blood, where it never existed.

The argument of Dr Hunter, founded on the transudation of blood, proceeds, he thinks, on an erroneous principle; for the blood of a living animal is actually thinned by the presence of the coagulable lymph: and, if this transudation takes place in a dead, and not in a living animal, it ought rather to be attributed to a change in the vessels, than their contents. And this is almost proven by the attentive examination of one of the strongest of the doctor's own facts, viz. the bilious tinge on parts contiguous to the gall-bladder, which only takes place after an animal has been some time dead; but is never found in one recently killed.

From all these, the author concludes, that, as the lymph is very different from water, it cannot be filtrated by inorganic passages; and that the common opinion is founded on reason and experiment, the lymph being not only transmitted thro' exhalant vessels, but by them changed in its properties, and adapted to the office of lubricating parts.

The manner in which the lymph is discharged into the cavities of the body being thus ascertained with a great degree of probability, Mr Hewson proceeds to examine how it is again absorbed, whether by the common veins, or by the lymphatic system. Besides the authority of all the ancients, the advocates for the first opinion think they are possessed of several conclusive arguments in its favour.

They allege, that, in dead bodies, injections easily

flow from the veins into several cavities. This Mr Hewson thinks, for many reasons, to have little force. The veins are very delicate, and may be ruptured by a very small distending power. And this seems in general to have been the case; for most of the injections used in these experiments were far too gross to reach the extremities of the veins. And when those of a more penetrating nature are employed, they imitate that transudation from vascular laxity, which takes place after death.

A second argument adduced in favour of the old opinion is, that chyle has been seen in the mesenteric veins. But this is a very inconclusive one, as the whole serum has been found of a white colour, and, in these vessels, might easily be mistaken for chyle. Another has been furnished by the structure of the penis: but this analogy is now given up; it being generally allowed, that the blood is not absorbed, but forced from its cells into the venous system.

Ligatures and compression on veins have afforded a fourth argument; but two circumstances unite to render this less satisfactory: 1<sup>st</sup>, The lymphatics, being contiguous to the veins, may be affected by the same cause. And, 2<sup>d</sup>, the compression of a vein will throw a greater quantity of fluids on the exhalant arteries, by obstructing their flow through the red ones.

It has been farther alleged, that there is no continuation of vessels nor any lymphatics in the placenta, though absorption evidently takes place. To this Mr Hewson replies, that there may be lymphatics, though not discovered, and continued vessels from the mother to the fetus, though never injected.

The sixth argument is supplied by an experiment of Kaau Boerhaave. He injected a fluid into the intestines, which soon appeared in the mesenteric veins. But Mr Hewson is much inclined to believe that there was some deception in this experiment, as it has been often repeated, without similar success. Did the fact even happen, it could never be by absorption, that ceasing soon after death, while this happened at the end of several hours; and, as pressure was applied to the stomach, the author thinks a venous rupture might give rise to the appearances observed by Kaau Boerhaave.

The seventh and last argument in favour of absorption by the veins was, that many animals were destitute of any other vessels capable of performing that office, as birds, fishes, and amphibians; but the discovery of lymphatics in every one of these, has totally overthrown this argument.

To all these, the ingenious Mr Meckel has, of late, added some others, derived from injections of mercury into the lymphatic glands, vesiculæ feminales, bladder, and lacteal ducts of the breast, which he found to pass readily, and without extravasation, into the adjacent veins. But Mr Hewson observes, that extravasation is detected with difficulty; and as the lymphatic vessels often lie contiguous to veins, it is not impossible that, in some cases, the mercury might burst from the one of them into the other, as often happened to Mr Hewson in the mesentery of the turtle. From all these, the author considers the old opinion as at least open to many and weighty objections.

Unsatisfied, however, with this negative proof, he goes on to show, that absorption in reality is carried on by the lymphatic system, from the analogy of all these

Lymphatics these vessels with the lacteals, which form a part of that system, and are without doubt absorbents. Besides this, the course by which poisons reach the circulating fluids when externally applied, evidently points out that they enter the lymphatic vessels alone, and are by them conveyed towards the heart. To these Mr Hewson adds his observation, that the same fluid is always found in these vessels, and the cavities whence they arise. Thus there will remain little doubt of the absorbent power of lymphatics, a function of such importance in the œconomy, that, for it alone, nature has provided a distinct set of vessels: they had indeed, by some, been suspected to be only reflected arterial branches; but this has been long confuted by the experiments of Dr Monro and Dr Hunter.

LYMPHATICS, in anatomy, the vessels in which the lymph is contained, and the glands by which it is separated in the human and other bodies. An account of the structure and offices of the lymphatic glands and vessels has lately been published, from Mr Hewson's experiments, by Mr Falconer of London. He observes, that each lymphatic gland is a congeries of tubes, consisting of arteries, veins, lymphatic vessels, and nerves, connected by the cellular substance. Glands of this kind, he remarks, are nowhere to be found but in the course of the larger lymphatic vessels. These vessels, in their passage from the extreme parts of the body towards the thoracic duct, enter and pass thro' the lymphatic glands in the following manner:

About a quarter of an inch before a lymphatic enters a gland, it divides into two, three, or four smaller branches, sometimes into a greater number. These enter the gland at the part farthest from the thoracic duct; and are then subdivided into branches, as small as the ramifications of the arteries and veins which accompany them to every part of the gland. After being thus minutely divided, they reunite, and gradually become larger as they approach the opposite side of the gland, forming three or four branches, which are joined by other lymphatics that arise from the cells of the gland. All these branches unite together about a quarter of an inch from that part where they came out of the gland, and form a common trunk, larger than that below the gland, by the additional lymphatics it receives from the cells of the gland.

Although, in every lymphatic gland, very small cells can be discovered by the microscope, those appearances in such glands which have commonly been called *cellular*, are by no means of that nature, being only, our author observes, little eminences formed by the bending of one vessel round another. On cutting into a fresh lymphatic gland, it is found to contain a thickish, white, milky fluid; and if this fluid be carefully washed from any part of it, and the gland then examined with the microscope, an infinite number of very small cells are observed, which cannot be discovered by the naked eye.

Mr Falconer adopts the opinion of the late Mr Hewson with respect to the *use* likewise of the lymphatic system. The glands he considers as organs intended for the purpose of secreting a fluid of a particular nature from the blood; and the lymphatic vessels he looks upon as so many excretory ducts. In proof of this assertion, he observes, that, if the arteries and

veins of a lymphatic gland have been previously injected with a coloured fluid, and a part of the gland be then viewed thro' the microscope, these cells, formerly taken notice of, appear extremely vascular. And it is into their cavities that the whole fluid found in the gland is secreted. This fluid is absorbed by the lymphatic vessels which arise from the cells of the glands, and is by them, in common with the other fluids, carried into the course of the circulation. The lymphatic vessels, therefore, which originate from the cells of the gland, are, in the lymphatic glands, analogous to the excretory ducts of other glands. We have the same proofs, our author asserts, that the lymphatic glands secrete this white fluid, and that it is carried from the lymphatic glands by the lymphatic vessels, that we have of glands in other parts of the body separating different fluids and having excretory ducts. For, if we cut into a lymphatic gland, we find a white fluid; and, if a ligature be made on the lymphatic vessel coming from that gland, we find a fluid of the same kind contained in those lymphatic vessels. This, Mr Falconer observes, is as convincing a proof that the lymphatic vessels are excretory ducts to the lymphatic glands; and as satisfactory, as that the hepatic duct is the excretory duct of the liver. We know the liver secretes bile, because we find it in that viscous; and we know the ductus hepaticus is its excretory duct, because we find bile contained in it. The proofs are similar, and therefore equally conclusive.

LYNCEUS, in fabulous history, one of the 50 sons of Ægeus, married Hypermnētra, one of the 50 daughters of Danaus. See HYPERMNĒSTRA.

LYNCEUS, in fabulous history, one of the Argonauts, who went with Jason in the expedition to obtain the golden fleece. He was of great use to the Argonauts, by enabling them to avoid the sand-banks and rocks they found in their way. The poets say, that Lynceus had so piercing a sight, that it could not only penetrate to the bottom of the sea, but even to hell. Some mythologists suppose, that this fable is taken from Lynceus's skill in observing the stars, and discovering the mines of gold and silver concealed in the earth.

LYNCURIUM, a stone thought to be the same with the tourmalin. The name is derived from λυξ, *lynx*, and οὐρον, *urine*.

LYNCURIUS LAPIS, a stone capable of producing mushrooms. See AGARICUS.

LYNN REGIS, a town of Norfolk, in England, situated in E. Long. o. 33. N. Lat. 52. 46. It is a handsome, large, well-built corporation-town, and sends two members to parliament; is encompassed with a wall and a deep trench; and there are two small rivers that run through its streets, over which there are about 15 bridges. It is a trading place on account of its commodious harbour; is governed by a mayor, recorder, high-steward, 12 aldermen, and 18 common council-men. Formerly it was well fortified; but it has now only a battery of 10 guns. It has two churches, a very large chapel, and two dissenting meeting-houses. Here are about 2000 houses, mostly pretty good ones, built with brick: the streets are narrow, but well-paved; it has a good market-place, with an elegant cross; and there are here some remains of monasteries.

LYNX, in zoology. See FELIS.

LYON,

LYON *King of Arms.* See KING; and LAW,  
Nº clviii. 16.

This office is of great antiquity and respect in Scotland; but although the precise time of its institution is unknown, yet it must have been as early as the introduction of armorial figures as hereditary marks of gentility and distinction into this country, which was in the 12th century. His regalia are, a crown of gold, with a crimson velvet-cap, a gold taffel, and an ermine lining; a velvet-robe reaching to his feet, with the arms of the kingdom embroidered thereon before and behind in the proper tinctures; a triple row of gold chain round his neck, with an oval gold medal pendant thereto, on one side of which is the royal bearing, and on the other St Andrew with his cross enamelled in proper colours, and a baton of gold enamelled green, powdered with the badges of the kingdom. The Lord Lyon's rank is superior to that of any other king of arms, as he holds his office immediately from the sovereign by commission under the great seal; whereas the kings of arms in England are deputies to the Earl Marshal, and act under his authority. Formerly Scotland was divided into two provinces, the one on the north and the other on the south side of Forth; and these provinces were under the management of two deputies appointed by the Lord Lyon to superintend the execution of all the business of his office. Before the revolution, the Lord Lyon at his admission into office was most solemnly crowned by the sovereign, or his commissioner, in presence of the nobility, the officers of state, and other great men, after a suitable sermon preached in the royal chapel; and his crown was of the same form with the imperial crown of the kingdom. On solemn occasions, he wears the regalia above described; at all other times, he wears the oval gold-medal or badge on his breast suspended by a broad green ribbon. He has the absolute disposal of all the offices in his own court, and of the heralds and pursuivants places. The messengers at arms throughout Scotland are also created by him, and are amenable to his jurisdiction. And the powers vested in him by his commission are the same with those of the sovereign in all matters relative to the marks of gentility.

To give the reader a more complete idea of the dignity and nature of this office, we shall subjoin,

*The order observed at the coronation of Sir Alexander Arskine of Cambo, Baronet, Lord-Lyon King of Arms, at the royal palace of Holyrood-house, on the 27th day of July 1681; his royal highness James duke of Albany and York being his majesty's high commissioner.* 1. The chair of state being placed upon a throne of two steps in height, under the royal canopy, in the chamber of presence; and the imperial crown, sceptre, and sword of state, being placed on a table before the throne, the said table covered with purple velvet fringed with gold; his majesty's high-commissioner was conveyed by the officers of state and the nobility to the throne, when he sat down in the chair of state, the nobility standing on each side.

II. Then Sir Alexander Arskine was introduced in this manner:

1. The king's six trumpets in their coats, two and two, sounding.

2. The six pursuivants at arms in their coats, two and two.

VOL. VI.

3. The six heralds in their robes, two and two, the last five bearing the Lord Lyon's regalia thus: the eldest his crown, the second his robe, the third his furcoat, the fourth his collar of gold and medal-pendant, the said collar being composed of three rows, and the fifth his baton.

III. Mr Robert Innes, Lyon-depute, bearing his patent under the great seal.

IV. The master of the ceremonies.

V. The Lord Lyon supported by two baronets, viz. Sir William Sharp of Scotcraig, and Sir John Maitland; and attended with the six macers on either side, with their silver maces.

VI. Then having three several times done their homage to his majesty's high commissioner, viz. at the door, in the middle of the chamber, and before the throne, those who carried the patent and regalia drew near to the chair of state; the rest of the heralds and pursuivants retiring to the windows, and the trumpets to a place allotted for them.

VII. The master of the ceremonies brought the Lord Lyon to his majesty's high commissioner, and he kneeled down before him on a velvet-cushion, and was dubbed knight with the sword of state.

VIII. The master of the ceremonies called for the patent under the great seal, and gave it to one of the clerks of the privy council, who read it aloud. He then delivered it to his royal highness, and from him to the Lord Lyon, shewing him the king's pleasure, his duty, and the importance of the honour conferred upon him by so gracious a master.

IX. His royal highness caused the Lord Lyon to swear the oath of allegiance, and take the declaration, the same being read by one of the clerks of the privy council.

X. The master of the ceremonies took the furcoat of arms, and gave it to his royal highness, who, with his assistance, put it on the Lord Lyon; his highness saying, "I do vest you with this coat and robe of your office during all the days of your lifetime, which you shall wear on all honourable occasions, keeping the same free from all spot of treason, villainy, and disgrace."

XI. The master of the ceremonies took the crown, and delivered the same to his royal highness; who put it on the Lord Lyon's head, saying, "In the name of his most sacred majesty the king, I crown you, Sir Alexander Arskine of Cambo, baronet, Lyon King of Arms throughout all the kingdom of Scotland, and the isles, colonies, and dependencies thereunto belonging, with all the powers, privileges, liberties, honours, and dignities, belonging to that office."

XII. The master of the ceremonies gave the baton to his royal highness; who, delivering it to the Lord Lyon, said, "I deliver to you this baton of your office, in token of that command and regal authority which his majesty gives you over all who bear his majesty's arms under you in this kingdom of Scotland."

XIII. The master of the ceremonies gave the collar to his royal highness; who put it about the Lord Lyon's neck, saying, "This royal token and badge of your master's favour, I give you to be worn by you all the days of your life, in token of your precedence before all others of under degree and quality, in consequence

Lyon  
||  
Lyons.

sequence of your good and faithful services done and to be done."

XIV. Then his royal highness blessed the Lord Lyon, and took his oath in the terms following: "I shall defend the Catholic faith to the uttermost of my power. I shall be leal and true, secret and servicable, to our fovereign lord the king, and to all estates, *that is to say*, to emperors, kings, princes, archdukes, dukes, marquisses, earls, viscounts, lords, or barons, knights, esquires, gentlemen, ladies, widows, and maidens of good fame, and shall forward their lawful busines upon their expence: and what ambassage or message I take in hand to do, I shall do the same truly, without adding or taking from. I shall forbear all open vices, common bordells, common hazard, and common drinking in taverns. I shall fortify and defend the privileges of the noble office of arms with all my power; and shall never reveal any man's secrets, treason excepted. I shall observe and keep all the forenamed points: So help me, God; and by my part of paradisic."

XV. Then one of the heralds, with sound of trumpet, proclaimed out of one of the windows Sir Alexander Araskine of Cambo, baronet, Lyon King of Arms throughout all the kingdom of Scotland, and the isles and dependencies thereunto belonging, with all the honours and privileges that to this office appertain.

XVI. His royal highness, taking the Lord-Lyon by both hands, raised him; who, taking off his crown, gave his highness his humble thanks, and then cried aloud, "A largess of the most high and mighty monarch Charles, by the grace of God, king of Scotland, England, France, and Ireland, defender of the faith, &c."

XVII. Then by sound of trumpets all the heralds and pursuivants proclaimed the same words out of the windows.

XVIII. The Lord-Lyon, in his robes, collar, and crown, with the baton of command in his hand, was attended back to the chamber from whence he came, in the same order as before, the heralds and pursuivants proclaiming round the court in their return, "A Largess," &c. *supra*.

LYONNOIS, a large province of France; bounded on the north, by Burgundy; on the east, by Dauphiny, Bresse, and the principality of Doms; on the south, by Vivarais and Velay; and on the west, by Auvergne and a small part of Bourbonnois. It comprehends Lower Lyonnois, Beaujolois, and Forez; and it produces corn, wine, fruits, and more especially excellent chefnuts. The principal rivers are the Soane, the Rhone, and the Loire. Lyons is the capital town.

LYONS, a large, rich, handsome, ancient, and famous town of France, being the most considerable in the kingdom, next to Paris, with an archbishop's see, an academy of sciences and belles lettres, and an academy of arts and sciences settled here in 1736. It is seated in the centre of Europe, on the confluence of the rivers Rhone and Soan: on the side of it are two high mountains; and the mountain of St Sebastian serves as a bulwark against the north winds, which often blow here with great violence. It contains about 150,000 inhabitants; and the houses, in general, are high and well built. It has six

gates, and as many suburbs. The town-house, the arsenal, the amphitheatre built by the ancient Romans, the hospital, and the numerous palaces, are worthy of a traveller's attention. The cathedral is a superb structure, and the canons that compose the chapter are all persons of distinction. It is a place of very great trade, which is extended not only through France, but to Italy, Switzerland, and Spain; and there are four celebrated fairs every year, which are frequented by great numbers of people. It derives vast advantages from the rivers it stands upon; and is situated in E. Long. 4. 55. N. Lat. 45. 46.

LYRA, in ichthyology. See CALLYONIMUS.

LYRE, a musical instrument of the stringed kind, much used by the ancients.

Concerning the number of strings with which this instrument was furnished, there is great controversy. Some assert it to be only three; and that the founds of the two remote were acute, and that of the intermediate one a mean between those two extremes: that Mercury, the inventor, resembled those three chords to as many seasons of the year, which were all that the Greeks reckoned, namely, Summer, Winter, and Spring; assigning the acute to the first, the grave to the second, and the mean to the third.

Others assert that the lyre had four strings; that the interval between the first and the fourth was an octave; that the second was a fourth from the first, and the fourth the same distance from the third, and that from the second to the third was a tone.

Another class of writers contend that the lyre of Mercury had seven strings. Nicomachus, a follower of Pythagoras, and the chief of them, gives the following account of the matter: "The lyre made of the shell was invented by Mercury; and the knowledge of it, as it was constructed by him of seven strings, was transmitted to Orpheus: Orpheus taught the use of it to Thamyris and Linus; the latter of whom taught it to Hercules, who communicated it to Amphion the Theban, who built the seven gates of Thebes to the seven strings of the lyre." The same author proceeds to relate "That Orpheus was afterwards killed by the Thracian women; and that they are reported to have cast his lyre into the sea, which was afterwards thrown up at Antissa, a city of Lesbos: that certain fishers finding it, they brought it to Terpander, who carried it to Egypt, exquisitely improved, and, shewing it to the Egyptian priests, assumed to himself the honour of its invention."

This difference among authors seems to have arisen from their confounding together the Egyptian and the Grecian Mercuries.—The invention of the primitive lyre with three strings was due to the first Egyptian HERMES, as mentioned under that article.—The lyre attributed to the Grecian Mercury is described by almost all the poets to be an instrument of seven strings\*. \* See Mr. Vincenzio Galilei has collected the various opinions of every the several Greek writers who have mentioned the invention of the chelys or testudo; and the late Mr Spence has done the same in a very circumstantial, but ludicrous manner. "Horace talks of Mercury as a wonderful musician, and represents him with a lyre. There is a ridiculous old legend relating to this invention, which informs us, that Mercury, after stealing some bulls from Apollo, retired to a secret grotto, which

Lyra,  
Lyre.

which he used to frequent, at the foot of a mountain in Arcadia. Just as he was going in, he found a tortoise feeding at the entrance of his cave: he killed the poor creature, and, perhaps, eat the flesh of it. As he was diverting himself with the shell, he was mightily pleased with the noise it gave from its concave figure. He had possibly been cunning enough to find out, that a thong pulled taut and fastened at each end, when struck by the finger, made a sort of musical sound. However that was, he went immediately to work, and cut several thongs out of the hides he had lately stolen, and fastened them as tight as he could to the shell of this tortoise; and, in playing with them, made a new kind of music with them to divert himself in his retreat. This, considered only as an account of the first invention of the lyre, is not altogether so unnatural."

The most ancient representations of this instrument agree very well with the account of its invention: the lyre, in particular on the old celestial globes, was represented as made of one entire shell of a tortoise; and that Amphion in the celebrated group of the Dirce, or Toro, in the Farnese palace at Rome, which is of Greek sculpture, and very high antiquity, is figured in the same manner. See Plate CLXI. fig. 9.

There have, however, been many other claimants to the seven-stringed lyre. For though Mercury invented this instrument in the manner already related, it is said he afterwards gave it to Apollo, who was the first that played upon it with method, and made it the constant companion of poetry. According to Homer's account of this transaction, in his hymn to Mercury, it was given by that god to Apollo, as a peace offering and indemnification for the oxen which he had stolen from him:

To Phœbus Maia's son presents the lyre,  
A gift intended to appease his ire.  
The god receives it gladly, and essays  
The novel instrument a thousand ways:  
With dextrous skill the plectrum wields; and sings,  
With voice accordant to the trembling strings,  
Such strains as gods and men approv'd, from whence  
The sweet alliance sprung of sound and sense.

Diodorus informs us, that Apollo soon repenting of the cruelty with which he had treated Marsyas in consequence of their musical contest, broke the strings of the lyre, and by that means put a stop for a time to any further progress in the practice of that new instrument. "The muses (adds he) afterwards added to this instrument the string called *mesé*; Linus, that of *lichanos*; and Orpheus and Thamyris, those strings which are named *hypate* and *parhypate* (A).

Again, many ancient and respectable authors tell

2

us, that, before the time of Terpander, the Grecian lyre had only four strings; and, if we may believe Suidas, it remained in this state 856 years, from the time of Amphion, till Terpander added to it three new strings, which extended the musical scale to a heptachord, or seventh, and supplied the player with two conjoint tetrachords. It was about 150 years after this period, that Pythagoras is said to have added an eighth string to the lyre, in order to complete the octave, which consisted of two disjoint tetrachords.

Boethius gives a different history of the scale, and tells us, that the system did not long remain in such narrow limits as a tetrachord. Choræbus, the son of Athis, or Atys, king of Lydia, added a fifth string; Hyagnis, a sixth; Terpander, a seventh; and, at length, Lychaon of Samos, an eighth. But all these accounts are irreconcilable with Homer's hymn to Mercury, where the chelys, or testudo, the invention of which he ascribes to that god, is said to have had seven strings. There are many claimants among the musicians of ancient Greece, to the strings that were afterwards added to these, by which the scale, in the time of Aristoxenus, was extended to two octaves. Athenæus, more than once, speaks of the nine-stringed instrument; and Ion of Chios, a tragic and lyric poet and philosopher, who first recited his pieces in the 82d olympiad, 452 B. C. mentions, in some verses quoted by Euclid, the ten-stringed lyre; a proof that the third conjoint tetrachord was added to the scale in his time, which was about 50 years after Pythagoras is supposed to have constructed the octachord.

The different claimants among the Greeks to the same musical discoveries, only prove, that music was cultivated in different countries; and that the inhabitants of each country invented and improved their own instruments, some of which happening to resemble those of other parts of Greece, rendered it difficult for historians to avoid attributing the same invention to different persons. Thus the single flute was given to Minerva, and to Marfyas; the syrinx, or sifflula, to Pan, and to Cybele; and the lyre, or cithara, to Mercury, Apollo, Amphion, Linus, and Orpheus. Indeed, the mere addition of a string or two to an instrument without a neck, was so obvious and easy, that it is scarce possible not to conceive many people to have done it at the same time.

With respect to the form of the ancient lyre; as little agreement is to be found among authors as about the number of strings. The best evidences concerning it are the representations of that instrument in the hands of ancient statues, bas-reliefs, &c. See Plate CLXI.

24 O 2

where

(A) It has been already related, that the lyre invented by the Egyptian Mercury had but three strings; and by putting these two circumstances together, Dr Burney observes, we may perhaps acquire some knowledge of the progress of music, or, at least, of the extension of its scale, in the highest antiquity.

*Mesé*, in the Greek music, is the fourth found of the second tetrachord of the great system, and first tetrachord invented by the ancients, answering to our A, on the fifth line in the base. If this found then was added to the former three, it proves two important points: first, that the most ancient tetrachord was that from E in the base to A; and that the three original strings in the Mercurian and Apollonian lyre were tuned E, F, G, which the Greeks called *Hypate Meson*, *Parhypate Meson*, *Meson Diatonos*. The addition therefore of *Mesé* to these, completed the first and most ancient tetrachord, E, F, G, A.

The string *lichanos*, then, being added to these, and answering to our D on the third line in the base, extended the compass downwards, and gave the ancient lyre a regular series of five sounds in the Dorian mode, the most ancient of all the Greek modes; and the two strings called *Hypate* and *Parhypate*, corresponding with our B and C in the base, completed the heptachord, or seven sounds, B, C, D, E, F, G, A, a compass that received no addition till after the time of Pindar, who calls the instrument then in use the *seven-tongued lyre*.

Fig. 9. is a representation of the *tesludo*, or lyre of Amphion, in front, as it appears on the base of the celebrated Toro Farnese at Rome. This admirable work, consisting of four figures bigger than the life, besides the toro, or bull, was found in Caracalla's baths, where the Farnese Hercules was likewise discovered; and, except the Laocoon, is the only piece of Greek sculpture mentioned by Pliny, that is now remaining. The two projections near the bottom seem to have been fastenings for the strings, and to have answered the purpose of tail-pieces in modern instruments.

10. The lyre held by Terpsichore, in the picture of that muse dug out of Herculaneum.

11. The Abyssinian *tesludo* or lyre in use at present in the province of Tigre, from a drawing of Mr Bruce's, communicated to Dr Burney. "This instrument, (says he) has sometimes five, sometimes six, but most frequently seven strings, made of the thongs of raw sheep or goat skins, cut extremely fine, and twisted; they rot soon, are very subject to break in dry weather, and have scarce any found in wet. From the idea, however, of this instrument being to accompany and sustain a voice, one would think that it was better mounted formerly.

"The Abyssinians have a tradition, that the *sistrum*, lyre, and tambourine, were brought from Egypt into Ethiopia, by Thot, in the very first ages of the world. The flute, kettle-drum, and trumpet, they say, were brought from Palestine, with Menelek, the son of their queen of Saba by Solomon, who was their first Jewish king.

"The lyre in Amharic is called *beg*, 'the sheep'; in Ethiopic, it is called *mesfinko*, the verb *sinko* signifies to strike strings with the fingers: no plectrum is ever used in Abyssinia; so that *mesfinko*, being literally interpreted, will signify the 'stringed instrument played upon with the fingers.'

"The sides which constitute the frame of the lyre were anciently composed of the horns of an animal of the goat kind, called *agazan*, about the size of a small cow, and common in the province of Tigre. I have seen several of these instruments very elegantly made of such horns, which nature seems to have shaped on purpose. Some of the horns of an African species of this animal may be seen in M. Buffon's history of the king of France's cabinet. They are bent, and less regular than the Abyssinian; but after fire-arms became common in the province of Tigre, and the woods were cut down, this animal being more scarce, the lyre has been made of a light red wood; however, it is always cut into a spiral twisted form, in imitation of the ancient materials of which the lyre was composed. The drawing I send you was one of these instruments made of wood.

"The kingdom of Tigre, which is the largest and most populous province of Abyssinia, and was, during many ages, the seat of the court, was the first which received letters, and civil and religious government; it extended once to the Red Sea: various reasons and revolutions have obliged the inhabitants to resign their seacoast to different barbarous nations, Pagan and Mahometans: while they were in possession of it, they say that the Red Sea furnished them with tortoise-shells, of which they made the bellies of their lyres, as the Egyptians did formerly, according to Apollodorus and Lucian; but having now lost that resource, they

have adopted, in its place, a particular species of gourd, or pumpkin, very hard and thin in the bark, still imitating with the knife the squares, compartments, and figure of the shell of the tortoise.

"The lyre is generally from three feet, to three feet six inches high; that is, from a line drawn thro' the point of the horns, to the lower part of the base of the sounding-board. It is exceedingly light, and easy of carriage, as an instrument should naturally be in so rugged and mountainous a country.

"When we consider the parts which compose this lyre, we cannot deny it the earliest antiquity. Man in his first state, was a hunter and a fisher, and the oldest instrument was that which partakes most of that state. The lyre, composed of two principal pieces, owes the one to the horns of an animal, the other to the shell of a fish.

"It is probable, that the lyre continued with the Ethiopians in this rude state, as long as they confined themselves to their rainy, steep, and rugged mountains; and afterwards, when many of them descended along the Nile in Egypt, its portability would recommend it in the extreme heats and weariness of their way. Upon their arrival in Egypt, they took up their habitation in caves, in the sides of mountains, which are inhabited to this day. Even in these circumstances, an instrument larger than the lyre must have been inconvenient and liable to accidents in those caverns; but when these people increased in numbers and courage, they ventured down into the plain, and built Thebes. Being now at their ease, and in a fine climate, all nature smiling around them, music, and other arts, were cultivated and refined, and the imperfect lyre was extended into an instrument of double its compass and volume. The size of the harp could be now no longer an objection; the Nile carried the inhabitants every where easily, and without effort; and we may naturally suppose in the fine evenings of that country, that the Nile was the favourite scene upon which this instrument was practised; at least the sphinx and lotus upon its head, seem to hint that it was some way connected with the overflowings of that river." See HARP.

12. An Etruscan lyre, with seven strings, in the collection of Etruscan, Greek, and Roman antiquities, published from the cabinet of the Hon. Sir William Hamilton, Vol. I. Naples 1766. Pl. cix. With respect to this instrument, it is worthy of observation, that though the vase upon which it is represented is of such indisputable and remote antiquity, the tail-piece, bridge, belly, and sound-holes, have a very modern appearance, and manifest a knowledge in the construction of musical instruments among the Etruscans superior to that of the Greeks and Romans in much later times. The lower part of the instrument has much the appearance of an old bass-viol, and it is not difficult to discover in it more than the embryo of the whole violin family. The strings lie round, as if intended to be played on with a bow; and even the cross lines on the tail-piece are such as we frequently see on the tail-pieces of old viols.

13. The tripodian lyre of Pythagoras the Zacynthian, from a bas-relief in the Massie palace at Rome representing the whole choir of the muses. Athenæus gives the following account of this extraordinary instrument, *lib. xiv. cap. 15. p. 637.* "Many ancient instru-

Lyre  
||  
Lythrum.

instruments are recorded, (says Artemon), of which we have so little knowledge, that we can hardly be certain of their existence; such as the tripod of Pythagoras the Zacynthian, which, on account of its difficulty, continued in use but a short time. It resembled in form the Delphic tripod, whence it had its name. The legs were equidistant, and fixed upon a moveable base that was turned by the foot of the player; the strings were placed between the legs of the stool; the vase at the top served for the purpose of a sound-board, and the strings of the three sides of the instrument were tuned to three different modes, the Doric, Lydian, and Phrygian. The performer sat on a chair made on purpose; striking the strings with the fingers of the left hand, and using the plectrum with the right, at the same time turning the instrument with his foot to whichever of the three modes he pleased; so that by great practice he was enabled to change the modes with such velocity, that those who did not see him, would imagine they heard three different performers playing in three different modes. After the death of this admirable musician, no other instrument of the same kind was ever constructed."

14. A lyre in the famous ancient picture dug out of Herculesaneum, upon which Chiron is teaching the young Achilles to play. See CHIRON.

LYRE, in astronomy. See ASTRONOMY, n° 206.

LYRIC, in general, signifies something sung to or played on the lyre: but it is more particularly applied to the ancient odes and stanzas answering to our airs and songs, and may be played on instruments. See POETRY, n° 52.

LYSANDER, a famous Spartan general. See SPARTA.

LYSIMACHIA, LOOSESTRIFE; a genus of the monogynia order, belonging to the pentandria class of plants. There are ten species, but only four are commonly cultivated in gardens. These are hardy, herbaceous perennials and biennials, rising with erect stalks from 18 inches to two or three feet high; garnished with narrow entire leaves; and terminated by spikes and clusters of monopetalous, rotated, five-parted spreading flowers of white and yellow colours.—They are easily propagated by seeds, and will thrive in any soil or situation.

LYSIPPUS, a celebrated Greek statuary, was born at Sicyone, and at first followed the business of a locksmith, which he quitted in order to practise painting. But he afterwards applied himself entirely to sculpture; in which he acquired an immortal reputation, and made a great number of statues that were the admiration of the people of Athens and Rome. His grand statue of the sun represented in a car drawn by four horses, was worshipped at Rhodes: he made several statues of Alexander and his favourites, which were brought to Rome by Metellus after he had reduced the Macedonian empire; and the statue of a man wiping and anointing himself after bathing, being particularly excellent, was placed by Agrippa before his baths in that city. He lived in the time of Alexander the Great, about 334 B. C.; and left three sons, who were all famous statuarys.

LYTHRUM, PURPLE LOOSESTRIFE; a genus of the monogynia order, belonging to the decandria

class of plants. There are ten species, of which the most remarkable are, 1. The *falcaria*, or common purple loosestrife, with oblong leaves, is a native of Britain, and grows naturally by the sides of ditches and rivers. It hath a perennial root, from which come forth several upright angular stalks, rising from three to four feet high, garnished with oblong leaves placed sometimes by pairs; but sometimes there are three leaves at each joint standing round the stalk. The flowers are purple, and produced in a long spike at the top of the stalk; so make a fine appearance. 2. The *hysspanum*, or Spanish loosestrife, with an hyssop leaf, grows naturally in Spain and Portugal. It hath a perennial root. The stalks are slender, not more than nine or ten inches long, spreading out on every side. The lower part of the stalks is garnished with oblong oval leaves placed opposite. The flowers come out singly from the side of the stalks at each joint; they are larger than those of the common sort, and make a fine appearance in the month of July when they are in beauty. The first kind is propagated by parting the roots in autumn, but requires a moist soil;—the second is propagated by seeds brought from those countries where it is native.

LYTTLETON (Edward), lord Lyttelton, keeper of the great seal in the reign of Charles I. was eminent for his probity and his moderation at the commencement of that monarch's disputes with his subjects. Without forfeiting his fidelity to the king, he preserved the esteem of the parliament till 1644, when he was made colonel of a regiment in the king's army at York. He died in 1645. Besides several of his speeches which have been printed, he wrote reports in the common pleas and exchequer printed at London in 1683, in folio; several arguments and discourses, &c.

LYTTLETON (George lord) eldest son of Sir Thomas Lyttelton, bart. descended from the great judge Littleton, was born in 1700, at seven months; and the midwife supposing him to be dead, threw him carelessly into the cradle; where, had not some signs of life been taken notice of by one of the attendants, he might never have recovered. He received the elements of his education at Eaton-school, where he shewed an early inclination to poetry. His pastorals and some other light pieces were originally written in that seminary of learning; from whence he was removed to the university of Oxford, where he pursued his classical studies with uncommon avidity, and sketched the plan of his Persian Letters, a work which afterwards procured him great reputation, not only from the elegance of the language in which they were composed, but from the excellent observations they contained on the manners of mankind.

In the year 1728, he set out on the tour of Europe; and, on his arrival at Paris, accidentally became acquainted with the honourable Mr Poyntz, then our minister at the court of Versailles; who was so struck with the extraordinary capacity of our young traveller, that he invited him to his house, and employed him in many political negotiations, which he executed with great judgment and fidelity.

Mr Lyttelton's conduct, while on his travels, was a lesson of instruction to the rest of his countrymen. Instead of lounging away his hours at the coffee-houses frequented.

Lyttelton.

Lyttelton. frequented by the English, and adopting the fashionable follies and vices of France and Italy, his time was passed alternately in his library, and in the society of men of rank and literature. In this early part of his life, he wrote a poetical epistle to Dr Ayscough, and another to Mr Pope, which shew singular taste and correctness.

After continuing a considerable time at Paris with Mr Poyntz, who, to use his own words, behaved like a second father to him, he proceeded to Lyons and Geneva; and from thence to Turin, where he was honoured with great marks of friendship by his Sardinian majesty. He then visited Milan, Venice, Genoa, and Rome, where he applied himself closely to the study of the fine arts; and was, even in that celebrated metropolis, allowed a perfect judge of painting, sculpture, and architecture.

During his continuance abroad, he constantly corresponded with Sir Thomas, his father. Several of his letters are yet remaining, and place his filial affection in a very distinguished light. He soon after returned to his native country, and was elected representative for the borough of Okehampton in Devonshire; and behaved so much to the satisfaction of his constituents, that they several times re-elected him for the same place, without putting him to the least expence.

About this period, he received great marks of friendship from Frederic prince of Wales, father of his present majesty; and was, in the year 1737, appointed principal secretary to his royal highness, and continued in the strictest intimacy with him till the time of his death. His attention to public business did not, however, prevent him from exercising his poetical talent. A most amiable young lady, Miss Fortescue, inspired him with a passion, which produced a number of little pieces, remarkable for their tenderness and elegance; and he had a happy facility of striking out an extempore compliment, which obtained him no small share of reputation. One evening being in company with lord Cobham and several of the nobility at Stowe, his lordship mentioned his design of putting up a bust of lady Suffolk in his beautiful gardens; and, turning to Mr Lyttelton, said, "George, you must furnish me with a motto for it." "I will, my lord," answered Mr Lyttelton; and directly produced the following couplet:

Her wit and beauty for a court were made,  
But truth and goodness fit her for a shade.

When Mr Pitt, the late earl of Chatham, lost his commission in the guards, in consequence of his spirited behaviour in parliament, Mr Lyttelton was in waiting at Leicester-house, and, on hearing the circumstance, immediately wrote these lines:

Long had thy virtue mark'd thee out for fame,  
Far, far superior to a cornet's name;  
This generous Walpole saw, and griev'd to find  
So mean a post disgrace that noble mind;  
The servile standard from thy free-born hand  
He took, and bade thee lead the patriot-band.

In the year 1742, he married Lucy, the daughter of Hugh Fortescue, Esq; of Filleigh in the county of Devon, the lady abovementioned, whose exemplary conduct, and uniform practice of religion and virtue,

established his conjugal happiness upon the most solid basis.

In 1744, he was appointed one of the lords commissioners of the treasury; and, during his continuance in that station, constantly exerted his influence in rewarding merit and ability. He was the friend and patron of the late Henry Fielding, James Thomson author of the Seasons, Mr Mallet, Dr Young, Mr Hammond, Mr West, Mr Pope, and Voltaire. On the death of Thomson, who left his affairs in a very embarrassed condition, Mr Lyttelton took that poet's filiter under his protection. He revised the tragedy of Coriolanus, which that writer had not put the last hand to; and brought it out at the theatre-royal, Covent-garden, with a prologue of his own writing, in which he so affectingly lamented the loss of that delightful bard, that not only Mr Quin, who spoke the lines, but almost the whole audience, spontaneously burst into tears.

In the beginning of the year 1746, his felicity was interrupted by the loss of his wife, who died in the 29th year of her age; leaving him one son, Thomas, the late lord Lyttelton; and a daughter, Lucy, who some time since married lord viscount Valentia. The remains of his amiable lady were deposited at Over-Arley, in Worcesterhire; and an elegant monument was erected to her memory in the church of Hagley, which contains the following inscription written by her husband:

Made to engage all hearts, and charm all eyes:  
Tho' meek, magnanimous; tho' witty, wife;  
Polite, as all her life in courts had been;  
Yet good, as she the world had never seen:  
The noble fire of an exalted mind,  
With gentlest female tenderness combin'd.  
Her speech was the melodious voice of love,  
Her song the warbling of the vernal grove;  
Her eloquence was sweeter than her long,  
Soft as her heart, and as her reason strong.  
Her form each beauty of her mind express'd,  
Her mind was virtue by the graces dress'd.

Besides these beautiful lines, Mr Lyttelton wrote a monody on the death of his lady, which will be remembered while conjugal affection and a taste for poetry exist in this country.

His masterly observations on the conversion and apostleship of St Paul, were written at the desire of Gilbert West, Esq; in consequence of Mr Lyttelton's asserting, that, beside all the proofs of the Christian religion, which might be drawn from the prophecies of the Old Testament, from the necessary connection it has with the whole system of the Jewish religion, from the miracles of Christ, and from the evidence given of his resurrection by all the other apostles, he thought the conversion of St Paul alone, duly considered, was of itself a demonstration sufficient to prove Christianity to be a divine revelation. Mr West was struck with the thought; and assured his friend, that so compendious a proof would be of great use to convince those unbelievers that will not attend to a longer series of arguments; and time has shown he was not out in his conjecture, as the tract is esteemed one of the best defences of Christianity which has hitherto been published.

In 1754, he resigned his office of lord of the treasury, and was made cofferer to his majesty's household, and sworn of the privy-council: previous to which, he married, a second time, Elizabeth, daughter of field-marshal Sir Robert Rich, whose indiscreet conduct gave him great uneasiness, and from whom he was separated, by mutual consent, a few years after his marriage.

After being appointed chancellor and under-treasurer of the court of exchequer, he was, by letters-patent dated the 19th of November 1757, 31 Geo. II. created a peer of Great Britain, by the style and title of *Lord Lyttelton, baron of Frankley, in the county of Worcester*. His speeches on the Scotch and mutiny bills in the year 1747, on the Jew bill in 1753, and on the privilege of parliament in 1763, showed found judgment, powerful eloquence, and inflexible inte-

grity. During the last 10 years he lived chiefly in retirement, in the continual exercise of all the virtues which can ennoble private life. His last work was *Dialogues of the Dead*, in which the morality of Cambray and the spirit of Fontenelle are happily united.

He was suddenly seized with an inflammation of the bowels, in the middle of July 1773, at his seat at Hagley; which terminated in his death, on the 22d of that month. His last moments were attended with unimpaired understanding, unaffected greatness of mind, calm resignation, and humble but confident hopes in the mercy of God. As he had lived universally esteemed, he died lamented by all parties. A complete collection of his works has been published since his decease, by his nephew George Ayscough, Esq.

## M.

**M**, A LIQUID consonant, and the 12th letter of the alphabet.

The sound of this letter is formed by shutting the lips, and thereby intercepting the breath, as it is strongly expressed through the mouth and nostrils jointly. Its sound is always the same in English; it suffers no consonant after it in the beginning of words and syllables, unless in some derived from the Greek, as *amnesty*, &c.

M, in prescription, signifies a *maniple*, or handful; and at the end of a receipt it imports *misc*, or mingle.

M, in astronomy, &c. denotes *meridional*, *southern*; sometimes *meridies*, or mid-day.

M, in law, the brand of a person convicted of manslaughter, and admitted to the benefit of clergy; it is burnt on the brawn of the left thumb.

M, among the ancients, was a numeral letter, signifying *one thousand*; and when a dash was added at the top of it, as *M̄*, it signified *a thousand times a thousand*.

MABILLON (John), a very learned writer of France in the 17th century, was born at Perre-monte, on the frontiers of Champagne, in 1632. He was educated in the university of Rheims, and afterwards entered into the abbey of the Benedictines of St Remy. In the year 1663, he was appointed keeper of the treasures and monuments of France at St Dennis: but having unfortunately broke a looking-glass there, which was pretended to have belonged to Virgil, he desired leave of his superiors to quit an employment which frequently obliged him to tell things he did not believe. Next year he went to Paris; and was very serviceable to father d'Acheri, who was desirous of having some young monk who could assist him in compiling his *Spicilegium*. This made him known. Soon after, the congregation of St Maur having formed a design of publishing new editions of the fathers, re-vised from the MSS. in the libraries of the Benedictines, Mabillon was charged with the edition of St Bernard, which he prepared with extraordinary dili-

gence. After that, he published many other works, which are evidences of his vast capacity and industry. In 1682, he was employed by Mr Colbert in examining some ancient titles relating to the royal family. The year following he sent him into Germany, to search the archives and libraries of the ancient abbeyes, for what was most curious and proper to illustrate the history of the church in general, and that of France in particular. He has published an account of this journey. In 1685, he undertook another journey into Italy, by order of the king of France; and returned the year following with a very noble collection. He placed in the king's library above 3000 volumes of rare books, printed and in MSS. and composed two volumes of the pieces which he had discovered in that country. He was highly esteemed for his virtues as well as his learning.

MACACO, or MACAUO. See LEMUR.

MACAO, a town of China, in the province of Canton, seated in an island at the mouth of the river Tac. The Portuguese have been in possession of the harbour for 150 years. Formerly they had a great trade here; but now they have only a fort with a small garrison. The houses are built after the European manner; and there is a Chinese mandarin, as well as a Portuguese governor, to take care of the town and the neighbouring country. E. Long. 112. 13. N. Lat. 22. 12.

MACAO, in ornithology. See PSITTACUS.

MACARONI. See FOLENGIO, and the next article.

MACARONIC, or MACARONIAN, a kind of burlesque poetry, consisting of a jumble of words of different languages, with words of the vulgar tongue Latinized, and Latin words modernized. *Macaronie*, among the Italians, as has been observed by Cælius Rhodiginus, signifies a *coarse clownish man*; and because this kind of poetry is patched out of several languages, and full of extravagant words, &c. the Italians, among whom it had its rise, gave it the name of

Macaronic  
||  
Macassar

of *macaronian*, or *macaronic* poetry. Others choose to derive it à *macaronibus*, from *macaroons*, a kind of confection made of meal not boulded, sweet-almonds, sugar, and the white of eggs, accounted a great dainty among the country-people in Italy; which, from their being composed of various ingredients, occasioned this kind of poetry, which consists of Latin, Italian, Spanish, French, English, &c. to be called by their name.

Example.—A bold fellow, in the *macaronic* style, says,

*Enfilavi omnes scadrone & regimandos, &c.*

Another example:

*Archelos pissoliferos furiamque manantius,  
Et grandem esmeutari quæ inopinam facta ruellæ est:  
Toxinunque alto troublantem corda clochero, &c.*

Theoph. Folengius, a Benedictine monk of Mantua, was the first who invented, or at least cultivated, this kind of verse. See FOLENGIO.

The best pieces of this kind are, the *Baldus* of Folengio, and *Macaronis Forza* by Stefano a Jesuit, among the Italians; and the *Reatus veritabilis super terribili esneuta paissanarum de Ruellis*, among the French. The famous Rabelais first transferred the *macaronic* style out of the Italian verse into French prose; and on the model thereof formed some of the best things in his *Pantagruel*. We have little in English in the *macaronian* way; nothing scarce, but some little loose pieces collected in Camden's remains. But the Germans and Netherlands have had their *macaronic* poets; witness the *Certamen Catholicum cum Calvinistis*, of one Martinus Hamconius Frisius, which contains about 1200 verses, all the words whereof begin with the letter C.

MACARSKA, a town of Dalmatia, and capital of Primorgia, with a pretty good harbour, and a bishop's see, seated on the gulph of Venice. E. Lon. 17. 57. N. Lat. 43. 42.

MACASSAR, a considerable kingdom of the island of Celebes, in the East-Indies. The climate is very hot; and would be intolerable, were it not for the rains which fall when the sun is directly over their heads. The soil is extremely fertile, and there are ripe fruits at all times of the year. There are great numbers of monkeys, who are devoured by monstrous serpents; some of which are so large, that they will swallow one of these animals entire. The Macassars are large, robust, courageous, and greatly addicted to war. They profess the Mahometan religion.

MACASSAR, a large, strong, and handsome town of the island of Celebes, and capital of the kingdom of the island of Celebes, where the king resides. The houses are all built of wood, and supported by thick posts; and they have ladders to go up into them, which they draw up as soon as they have entered. The roofs are covered with very large leaves, which prevent the rain from entering. It is seated near the mouth of a large river, which runs through the kingdom from north to south. E. Long. 117. 55. S. Lat. 5. 0.

MACCABÆUS (Judas). See JUDAS.

MACCABEES, two apocryphal books of Scripture; so called from Judas the son of Mattathias, sur-

named *Maccabæus*, either on account of his valour, or because he bore on his standard the first letters of a sentence in Exodus, which, joined together, form the name *Maccabee*. The Hebrews call them *The books of the Asmonæans*, because (according to Josephus and Eusebius) Mattathias was the son of *Hafsonæus*, or *Asmonæus*, which was the name of the family. The first book of the Maccabees is an excellent history; and comes nearest to the style and manner of the sacred historians of any extant. It contains the history of 40 years, from the reign of Antiochus Epiphanes, to the death of Simon the high-priest; that is, from the year of the world 3829, to the year 3869, or 131 B. C. The second book of the Maccabees begins with two epistles sent from the Jews of Jerusalem to the Jews of Egypt and Alexandria, to exhort them to observe the feast of the dedication of the new altar erected by Judas on his purifying the temple. After these epistles follows the preface of the author to his history; which is an abridgment of a larger work, composed by one Jason, a Jew of Cyrene, who wrote the history of Judas Maccabæus and his brethren, and the wars against Antiochus Epiphanes, and Eupator his son. This second book does not by any means equal the accuracy and excellency of the first. It contains a history of about 15 years, from the execution of Heliodorus's commission, who was sent by Seleucus to fetch away the treasures of the temple, to the victory obtained by Judas Maccabæus over Nicanor; that is, from the year of the world 3828, to the year 3843, or 147 B. C.

MACBETH, a Scots nobleman in the 11th century, nearly allied to Duncan king of Scotland.—Not contented with curbing the king's authority, he carried his pestilent ambition so far as to put him to death; and, chasing Malcolm Kenmure his son and heir into England, usurped the crown. Siward earl of Northumberland, whose daughter Duncan had married, undertook, by the order of Edward the Confessor, the protection of the fugitive prince.—He marched with an army into Scotland; defeated and killed Macbeth in Scotland; and restored Malcolm to the throne of his ancestors. Shakspeare hath made this transaction the subject of one of his best tragedies.

MACCLESFIELD, a town of Cheshire in England, seated on the edge of a forest of the same name, upon a high bank, near the river Bollin. It is a large handsome town, with a fine church, and a very high steeple. It has manufactures in mohair, twist, hat-bands, buttons, and thread. Of late there have been several flint-mills erected there. W. Long. 2. 10. N. Lat. 53. 15.

MACE, the second coat or covering of the kernel of the nutmeg, is a thin and membranaceous substance, of an oleaginous nature, and a yellowish colour; being met with in flakes of an inch or more in length, which are divided into a multitude of ramifications. It is of an extremely fragrant, aromatic, and agreeable flavour; and of a pleasant, but acrid, oleaginous taste.

Mace is carminative, stomachic, and astringent; and possesses all the virtues of nutmeg, but has less astringency.—The oils of mace and nutmeg, whether prepared by distillation or expression, are so much of the same nature, that they may be indiscriminately used

Macassar  
||  
Macc.

<sup>1</sup> Macedon. fed for one another on all occasions. They give ease in cholics, and often in nephritic cases, taken internally from one drop to five or six of the distilled oil, or an equal quantity of the expressed; and externally, they are of use to rub paralytic limbs: they also assist digestion; and will often stop vomitings and hiccoughs, only by being rubbed on the region of the stomach. The nurses have a custom of applying oil of mace by expression to childrens navels to ease their gripes, and that often with success; and we are assured, by authors of credit, that, when rubbed on the temples, it promotes sleep.

MACEDON, or MACEDONIA, a most celebrated kingdom of antiquity, was bounded on the east by the *Ægean* sea; on the south, by *Thessaly* and *Epirus*; on the west, by the *Adriatic*, or the *Ionian* sea; and on the north, by the river *Strymon* and the *Scardian* mountains, but afterwards by the river *Nessus* or *Nestus*. Its most ancient name was *Æmathia*, which it had from *Æmathius*, a prince of great antiquity. The name of *Macedon* was derived, according to some, from king *Macedo*, a descendant of *Deucalion*; but, according to others, this name is only a corruption of the word *Mygdonia*, one of its provinces.

In times of the remotest antiquity, Macedonia, as well as the rest of Europe, was parcelled out into a vast multitude of petty states, the names of which are now almost forgotten, and their history entirely unknown. About 795 B. C. one Caranus, an Argive, and a descendant of *Hercules*, left his country at the head of a considerable body of troops, in order to found a new colony. According to the prevailing superstition, he consulted the oracle before he set out, and was commanded to establish his empire according to the direction of the goats. Caranus proceeded for some time without knowing what to make of the oracle's answer. However, having entered the little kingdom of *Æmathia*, one of the ancient divisions of Macedonia, he observed a herd of goats running for shelter from a sudden storm towards the capital, then called *Edessa*, and governed by king *Midas*. Upon this, recollecting the answer, he immediately possessed himself of the city by surprise; and soon after, the whole kingdom submitted to his government. In gratitude to his conductors the goats, Caranus named his city *Ægeæ*, and called his people *Ægiætes*; and, in order to perpetuate the memory of this extraordinary event, he likewise made use of the figure of a goat in his standard.

The founder of the Macedonian monarchy left his kingdom to his son Cænus, after a reign of three years, during which he considerably enlarged his dominions. After him followed *Thurymas* and *Perdiccas I.* during whose reigns we find nothing memorable. In the reign of *Argæus*, who ascended the throne about 691 B. C. the *Illyrians*, a fierce and barbarous nation in the neighbourhood, first invaded Macedonia, and did considerable mischief; but the king having decoyed them by a stratagem, put them to flight with great slaughter, and thus delivered his kingdom from them for the present. The reign of his successor *Philip*, however, was much disturbed by the incursions of these people and the *Thracians*, as well as that of *Æropas*; who succeeded *Philip*.

In the mean time, the states of Greece had begun to  
VOL. VI.

emerge from their barbarism, and the eastern part of Macedonia the world was almost totally subjected to *Cyrus* the first monarch of *Persia*. At this critical period *Alcetas* began to reign over Macedonia; but had the good fortune to preserve his dominions from the encroachments of the Greeks on the one hand, and the usurpation of the Persians on the other. In the reign of *A-<sup>4</sup>myntas* his successor, *Megabizus* sent seven of the principal commanders of his army, requiring him to acknowledge king *Darius* for his sovereign. These ambassadors, however, were all murdered by the contrivance of *Alexander* the king of Macedonia's son, on account of their attempting to violate some of the Macedonian women. This rash action threatened the entire ruin of the kingdom; but *Alexander* found means to pacify the Persian general sent against him, by giving him in marriage his sister *Gygæa*, a very beautiful woman, with whom the Persian fell in love as soon as he saw her. Thenceforward the Macedonian kings became dependent on the emperors of Persia, and were always regarded as faithful friends and allies.

The alliance of *Amyntas* with *Bubaris*, the Persian general, who had married his daughter, proved of great service to the Macedonians. Through the interest of his son-in-law, *Amyntas* obtained the country lying near *mount Hæmus* and *Olympus*; and at the same time the city of *Alabanda* in *Phrygia* was given to one *Amyntas*, the nephew of *Alexander*. After the battle of *Salamis*, *Mardonius* was left with an army of 400,000 men to attempt the conquest of Greece by land; and at that time Macedonia and the neighbouring countries are said to have augmented the Persian army with 200,000 recruits. Some cities, however, adhered to the Grecian interest, particularly *Potidea*, *Olynthus*, and *Pallene*. The two last were taken, and the inhabitants massacred by the Persians; but *Potidea* escaped, by the sea breaking into the Persian camp, and there making great devastation. *Alexander* afterwards gained the favour of the Greeks by giving them intelligence of the time when *Mardonius* designed to attack them; and thus freed his country from any danger that might have happened on account of the assistance which had been given to the Persians. The other transactions of his reign, however, are totally unknown.

*Perdiccas II.* the son of *Alexander*, began his reign in a very embarrassed situation. The *Thracians* and other barbarous nations looked with a jealous eye on his increasing kingdom; the Persians treated him as their vassal; and the Athenians were become so powerful by their colonies and allies on the sea-coast, that he was in no small danger from them. The king, however, was a man of great abilities and prudence. For some time he amused the Athenians with a shew of friendship; but, finding, that they treated him with haughtiness, he resolved to check their rising power in that part of the world. An occasion for this soon offered, and a war ensued; which, however, was not attended with any material advantage on either side, and *Perdiccas* died without being able to accomplish his schemes. After his death, the kingdom of Macedonia seemed to decline; inasmuch, that the states of Greece became arbiters with regard to its affairs; and we find *Perdiccas III.* raised to the throne by the decision of *Pelopidas* the Theban. *Philip*, the new king's brother,

6  
Perdiccas  
defeated  
and killed.

there, went along with Pelopidas to Thebes; where he was educated by the celebrated Epaminondas, and where he became such a proficient in the arts of policy as well as war, that all the powers of Greece were not able to resist him. Perdiccas in the mean time governed the Macedonians with tolerable good fortune; till he engaged in a war with the Illyrians, by whom he was defeated and killed, and the kingdom left seemingly on the verge of destruction.

7  
Philip  
takes upon  
him the  
govern-  
ment.

Perdiccas left an infant-son, named Amyntas; but the emergency of public affairs required that some able and experienced person should hold the reins of government; and therefore Philip, whose ambition at any rate was boundless, set out immediately from Thebes, in order to take possession of the kingdom. Though only 22 years of age, he was far from sinking under the load of public affairs, even in their most desperate state. In order to establish himself firmly on the throne, he first applied to the army, whom he caressed with the strongest expressions of friendship; and then to the nobility, whom he gained over to his interest by the strongest testimonies of confidence, and by vast promises. He next gave a check to the Athenian power, by declaring Amphipolis, over which the Athenians claimed a jurisdiction, to be a free city. The chief men in Pæonia he gained by presents; and in the same way he persuaded his rival Pausanias to drop his claim to the crown of Macedon; after which, having entirely set aside Amyntas, whose guardian he had hitherto pretended to be, he caused himself to be declared king of Macedon.

8  
Defeats the  
Athenians.

The next care of Philip was to introduce a more strict discipline among the troops; which he had partly learned from the Thebans, and partly invented himself. He particularly instituted, or rather modelled, the phalanx; taught the soldiers how to become more formidable from order, and a just conception of the rules of war, than they could be from mere force; and by the help of frequent instructions, kind language, and sometimes severity, he at length attained his end.—An opportunity soon offered of trying how much his soldiers had profited by his instructions. Argæus, an Athenian commander, had advanced with an army of mercenaries as far as Ægæ, but was obliged by the inhabitants to retire. Philip pursued him, and defeated his troops with great slaughter: and this first instance of success greatly revived the spirits of the Macedonians; while the king secured to himself the reputation of clemency, by admitting to a capitulation a considerable body of the enemy that had retired to an eminence.

9  
Reduces  
Pæonia,  
and defeats  
the Illyri-  
ans.

This victory, together with Philip's renouncing his right to Amphipolis, procured a peace with the Athenians; and soon after Agis, king of Pæonia, another of his enemies, was taken off by death. This news no sooner reached the ears of the Macedonian monarch, than he invaded Pæonia, took most of the cities, and obliged the inhabitants to own themselves his subjects. After this success he marched without delay against the Illyrians, defeated them with great slaughter, and obliged them to abandon all their conquests. No sooner was this important victory gained, than Philip began to meditate greater things, and to put them in execution almost as soon as they came into his mind. He suddenly sat down with his army

before the city of Amphipolis, in order to lay siege to it. The inhabitants sent deputies to Athens, to implore the protection of that state; but, as Philip pretended that he would deliver up the city to the Athenians as soon as he had taken it, the request of the Amphipolitans was disregarded. The town was soon taken by storm, and Philip put to death or banished such as were not in his interest; and then, instead of delivering it to the Athenians, he attacked Pydna and Potidæa, in the last of which was an Athenian garrison. This garrison he dismissed with honour, and then delivered the city to the Olynthians; according to a maxim he very frequently made use of, namely, that those are to be obliged whom we cannot overcome.

After these victories, Philip determined to make himself master of the country between the river Strymon and the Nessus, on account of the gold with which it abounded. At that time it was possessed by the Thracians, who had fortified *Crenides* its capital city; but Philip took the city by surprise, and quickly made himself master of the whole district. The name of the city he changed to *Philippi*; and gave directions for working the gold mines to greater advantage than before, by which means he established a revenue from that country of 1000 talents per annum.

At this time all Greece was in confusion on account of the *Phœcian*, or (as it was called) the *sacred*, war; the occasion of which was as follows. The Phœcians had ploughed some of the lands belonging to the Delphic Apollo; for which they were fined by the Amphictyons, or states-general of Greece; but, instead of submitting to the judgment of that court, the Phœcians, at the instance of Philomelus, a bold and daring speaker, seized on the temple itself, and all the riches belonging to Apollo. This immediately set all Greece in a flame. The Locrians and Boeotians made war on the Phœcians; and to countenance their cause, called it *sacred*. The Phœcians, on the other hand, pretended that they were far from being sacrilegious persons; for that they meddled not at all with the riches of the temple, but only resumed the honour of protecting it, which had belonged to their ancestors; and the better to support their arguments, they prevailed on the Athenians and Lacedæmonians to become their allies. The war was carried on a long time with various success; sometimes the Phœcians, and sometimes the Thebans prevailing. However, it was generally thought that the Athenians acted unworthily in sending such great supplies as they did to the Phœcians, (at one time 5000 foot and 300 horse); and this the rather, because it was known that they had few other motives than the great pay which was given to their troops; and as the money expended on this occasion was raised either by the coinage or sale of the dedicated things in the temple of Delphos, it was considered as sacrilege to receive any part of this theft, especially for defending the robbers.—Of this war Philip took the advantage in order to extend his territories without interruption. It also produced various applications from the contending parties in order to procure his assistance, which soon produced a very considerable alteration in favour of the Macedonian affairs.

Philip's first enterprize was the reduction of the city of Methone; after which he entered Theffaly, being

Macedon.

being invited thither by the petty princes of the country, who were oppressed by the tyranny of Lycophron the brother of Alexander of Pheræa. The tyrant demanded assistance from Onomarchus the Phocian general; but notwithstanding their assistance, both he and his allies were driven out of Theffaly. Upon this, Onomarchus marched against Philip with all his forces, defeated him in two engagements, and drove him out of Theffaly in his turn in great distress. After this disaster, Philip applied himself with all possible diligence to the recruiting of his army; and having prevailed on the Theffalians to exert themselves in his favour, at last defeated and killed Onomarchus with the loss of great part of his army. Philip caused the body of the slain general to be hung up with ignominy; and denied also funeral rites to all that were slain, looking upon them as sacrilegious persons on account of the violence offered to the possessions of Apollo, Lycophron, and his brother Pitholans, seeing no hopes of retaining their principality, were content to resign it; and being dismissed on giving their oaths to be quiet, they delivered up the city of Pheræa into the hands of Philip: who, as he had promised to the Theffalians, restored all the cities to liberty; and having thereby secured the friendship of so powerful a nation, he attempted to pass through the Pylæ, in order to make war on the Phocians.

25  
Is hindered  
by the  
Athenians  
from en-  
tering  
Greece.

This was a very bold attempt, and failed not to alarm all Greece; for since the defeat of the Persians at Platæa, no Macedonian prince had ever set his foot in Greece. The Athenians, therefore, being informed of his design, marched with the utmost expedition, seized the passes, and obliged him for that time to abandon his purpose, and return into Macedon.— This produced an implacable hatred between Philip and the Athenians; for the ruin of whose power he instantly began to form schemes, as he saw they were the only people in Greece who were capable of opposing his designs. He began with reducing some neutral cities; and at last laid siege to Olynthus, a place of very great importance, and which he himself had hitherto owned to be free and independent. This city held the balance of power between Athens and Macedon; and therefore Demosthenes, the celebrated Athenian orator, used all his influence with his countrymen to send sufficient assistance to the Olynthians. Through the negligence or volatility of that people, however, these succours were delayed till the city was taken by treachery, the houses plundered, and the inhabitants sold for slaves.

26  
Takes O-  
lynthus.

Philip's chief hope was in putting an end to the Phocian war; for which purpose he affected a neutrality, that he might thereby become the arbiter of Greece. His hopes were well founded; for the Thebans, who were at the head of the league against the Phocians, solicited him on the one side, and the states confederate with the Phocians did the like on the other. He answered neither, yet held both in dependence. In his heart he favoured the Thebans, or rather placed his hopes of favouring his own cause on that state; for he well knew, that the Athenians, Spartans, and other states allied with Phocis, would never allow him to pass Thermopylæ, and lead an army into their territories. So much respect, however, did he shew to the ambassadors from these states, parti-

cularly Ctesiphon and Phrynion, who came from A. Macedon. then, that they believed him to be in their interest, and reported as much to their masters. The Athenians, who were now dissolved in ease and luxury, received this news with great satisfaction; and named immediately ten plenipotentiaries to go and treat of a full and lasting peace with Philip. Among these plenipotentiaries were Demosthenes and Æschines, the most celebrated orators in Athens. Philip gave directions, that these ambassadors should be treated with the utmost civility; naming, at the same time, three of his ministers to confer with them, viz. Antipater, Parmenio, and Eurylochus. Demosthenes being obliged to return to Athens, recommended it to his colleagues not to carry on their negotiations with Philip's deputies; but to proceed with all diligence to court, there to confer with the king himself. The ambassadors, however, were so far from following his instructions, that they suffered themselves to be put off for three months by the arts of Philip and his ministers.

27  
Over-  
reaches the  
Athenians,  
and at last  
concludes a  
peace.

In the mean time, the king took from the Athenians such places in Thrace as might best cover his frontiers; giving their plenipotentiaries, in their stead, abundance of fair promises, and the strongest assurances that his good-will should be as beneficial to them as ever their colonies had been. At last a peace was concluded; but then the ratification of it was deferred till Philip had possessed himself of Pheræa in Theffaly, and saw himself at the head of a numerous army; then he ratified the treaty; and dismissed the plenipotentiaries with assurances, that he would be ready at all times to give the Athenians proofs of his friendship. On their return to Athens, when this matter came to be debated before the people, Demosthenes plainly told them, that, in his opinion, the promises of Philip ought not to be relied on, because they appeared to be of little significance in themselves, and came from a prince of so much art, and so little fidelity, that they could derive no authority from their maker. Æschines, on the other hand, gave it as his sentiment, that the king of Macedon's assurances ought to give them full satisfaction. He said, that, for his part, he was not politician enough to see any thing of disguise or dissimulation in the king's conduct; that there was great danger in distrusting princes; and that the surest method of putting men upon deceit, was to shew that we suspected them of it. The rest of the plenipotentiaries concurred with Æschines; and the people, desirous of quiet, and addicted to pleasure, easily gave credit to all that was said, and decreed that the peace should be kept. All this was the easier brought about, because Phocion, the worthiest man in the republic, did not oppose Philip; which was owing to his having a just sense of the state his country was in. He conceived, that the Athenians of those times were nothing like their ancestors; and therefore, as he expressed himself on another occasion, he was desirous, since they would not be at the head of Greece themselves, that they would at least be upon good terms with that power which would be so.

Philip, who knew how to use as well as to procure Passes opportunity, while the Athenians were in this good Thermo- humour, passed Thermopylæ, without their knowing Pylæ, and whether he would fall on Phocis or Thebes; but he Phocian quickly undeceived them, by commanding his soldiers war,

Macedon. to put on crowns of laurel, declaring them thereby the troops of Apollo, and himself the lieutenant-general of that god. He then entered Phocis as an air of triumph; which so terrified the Phocians, whom he had caused to be proclaimed sacrilegious persons, that they immediately dismissed all thoughts of defence, and without more ado submitted to his mercy. Thus the Phocian war, which had so long employed all Greece, was ended without a stroke; and the judgment on the Phocians remitted to the Amphictyons, or grand council of Greece. By their decree the walls of three Phocian cities were demolished, the people were forbid to inhabit in any but villages, to pay a yearly tribute of 60 talents, and never to make use either of houses or arms, till they had repaid to the temple of Apollo the money they had sacrilegiously carried from thence. Their arms were taken from them, broken to pieces, and burnt; their double voice in the council was taken from them, and given to the Macedonians. Other orders were made for settling the affairs both of religion and state throughout Greece: all of which were executed by Philip with great exactness and moderation; he paying the most profound respect to the council; and, when he had performed its commands, retiring peaceably with his army back to Macedon, which gained him great reputation.

19  
Is again  
opposed by  
the Athenians.

At Athens alone, the justice and piety of Philip was not understood. The people began to see, though a little too late, that they had been abused and deceived by those who had negotiated the late peace. They saw, that, through their acceptance of it, the Phocians were destroyed; that Philip was become master of Thermopylæ, and might enter Greece when he pleased; that, in abandoning their allies, they had abandoned themselves; and that, in all probability, they might soon feel the weight of his power, whom they had so foolishly trusted: they therefore began to take new and hostile measures; they ordered, that the women should retire out of the villages into the city, their walls to be repaired, and their forts new strengthened. They seemed inclined to question Philip's election into the council of the Amphictyons, because it had been done without their consent; and even to proceed to an open war. In all likelihood they had carried things to extravagancy, if Demolthenes had not interposed. He told them, that though he was not for making the peace, he was however for keeping it; and that he saw no manner of occasion for their maintaining into so unequal a contest as would needs ensue, if they took up arms, not only against Philip, but against all the states concurring with him in the late transactions. This seems to have cooled the rage of the Athenians; and to have brought them to think of ruining Philip by degrees, as by degrees they had raised him.

20  
Pursues his  
conquests  
in Thrace.

The fame of his achievements without the bounds of Macedon having disposed the subjects of Philip to hope every thing from his conduct, and the several states of Greece to desire above all things his friendship; that prudent monarch laid hold of this favourable situation to fix his dominion on such a stable foundation as that a reverse of fortune should not immediately destroy it. To this end, while he carried on his negotiations through Greece, he likewise kept his army in exercise, by taking several places in Thrace,

which terribly incommoded the Athenians. Diopithes, who had the government of the Athenian colonies in those parts, perceiving well what end Philip had in view, did not stay for instructions from home; but having raised with much expedition a considerable body of troops, taking advantage of the king's being absent with his army, entered the adjacent territories of Philip, and waited them with fire and sword.

Macedon.

21  
His dominions  
invaded by  
Diopithes.

The king, who on account of the operations of the campaign in the Chersonese, was not at leisure to repel Diopithes by force, nor indeed could divide his army without imminent hazard, chose, like an able general, rather to abandon his provinces to insults, which might be afterwards revenged, than, by following the dictates of an ill-timed passion, to hazard the loss of his veteran army, whereon lay all his hopes. He contented himself, therefore, with complaining to the Athenians of Diopithes's conduct, who in a time of peace had entered his dominions, and committed such devastations as could scarce have been justified in a time of war. His partisans supported this application with all their eloquence. They told the Athenians, that unless they recalled Diopithes, and brought him to a trial for this infringement of the peace, they ought not to hope either for the friendship of Philip, or of any other prince or state; neither could they justly complain, if, prompted by such a precedent, others should break faith with them, and fall without the least notice upon their dominions. Demolthenes defended Diopithes; and undertook to shew, that he deserved the praise and not the censure of the Athenians. Those of the other party began then to charge him with crimes of a different nature; they alleged, that he oppressed the subjects and maltreated the allies of Athens. Demolthenes replied, that of these things there were as yet no proofs; that when such should appear, a single galley might be sent to bring over Diopithes to abide their judgment, but that Philip would not come if they sent a fleet; whence he inferred, that they ought to be cautious, and to weigh well the merits of this cause before they took any resolution. He said, that it was true, Philip had not as yet attacked Attica, or pretended to make a descent on their territories in Greece, or to force his way into their ports; when it came to that, he was of opinion they would be hardly able to defend themselves; wherefore he thought such men were to be esteemed as fought to protect their frontiers, in order to keep Philip as long as might be at a distance: whereupon he moved, that, instead of disowning what Diopithes had done, or directing him to dismiss his army, they should send him over recruits, and show the king of Macedon, they knew how to protect their territories, and to maintain the dignity of their state, as well as their ancestors. The arguments had such an effect, that a decree was made conformable to his motion.

22  
Who is de-  
fended by  
Demolthe-  
nes.

While affairs stood thus, the Illyrians recovering courage, and seeing Philip at such a distance, harassed the frontiers of Macedon, and threatened a formidable invasion: but Philip, by quick marches, arrived on the borders of Illyrium; and struck this barbarous people with such a panic, that they were glad to compound for their former depredations at the price he was pleased to set. Most of the Greek cities in Thrace

now

Macedon. now fought the friendship of the king, and entered into a league with him for their mutual defence. As it cannot be supposed, that each of these free cities had a power equal to that of Philip, we may therefore look upon him as their protector. About this time, Philip's negotiations in Peloponnesus began to come to light : the Argives and Messenians, growing weary of that tyrannical authority which the Spartans exercised over them, applied to Thebes for assistance ; and the Thebans, out of their natural aversion to Sparta, sought to open a passage for Philip into Peloponnesus, that, in conjunction with them, he might humble the Lacedæmonians. Philip readily accepted the offer ; and resolved to procure a decree from the Amphictyons, directing the Lacedæmonians to leave Argos and Messene free ; which if they complied not with, he, as the lieutenant of the Amphictyons, might, with great appearance of justice, march with a body of troops to enforce their order. When Sparta had intelligence of this, she immediately applied to Athens, earnestly intreating assistance, as in the common cause of Greece. The Argives and Messenians, on the other hand, laboured assiduously to gain the Athenians to their side ; alleging, that, if they were friends to liberty, they ought to assist those whose only aim was to be free. Demosthenes, at this juncture, outwitted Philip, if we may borrow that king's expression : for, by a vehement harangue, he not only determined his own citizens to become the avowed enemies of the king ; but also made the Argives and Messenians not over-fond of him for an ally ; which when Philip perceived, he laid aside all thoughts of this enterprize for the present, and began to practise in Eubœa.

This country, now called *Negropentis*, is separated from Greece by the Euripus, a Strait so narrow, that Eubœa might easily be united to the continent. This situation made Philip call it *the fetters of Greece*, which he therefore sought to have in his own hands. There had been for some years great disturbances in that country ; under colour of which, Philip sent forces thither, and demolished Porthmos, the strongest city in those parts, leaving the country under the government of three lords, whom Demosthenes roundly calls *tyrants* established by Philip. Shortly after, the Macedonians took Oreus, which was left under the government of five magistrates, styled also *tyrants* at Athens. Thither Plutarch of Eretria, one of the most eminent persons in Eubœa, went to represent the distresses of his country, and to implore the Athenians to set it free. This suit Demosthenes recommended warmly to the people ; who sent thither their famous leader Phocion, supported by formidable votes, but a very slender army : yet so well did he manage the affairs of the commonwealth and her allies, that Philip quickly found he must for a time abandon that project ; which, however, he did not till he had formed another no less beneficial to himself, or less dangerous to Athens. It was, the prosecution of his conquests in Thrace, which he thought of pushing much farther than he had hitherto done, or could be reasonably suspected to have any intention of doing.

Extraordinary preparations were made by the Macedonian monarch for this campaign. His son Alexander was left regent of the kingdom ; and he himself with 30,000 men laid siege to Perinthus, one of the

strongest cities in the country. At present, however, all his arts of cajoling and pretending friendship were insufficient to deceive the Athenians. They gave the command of their army and fleet to Phocion ; a general of great abilities, and with whom Philip would have found it very hard to contend. On the other hand, the king of Persia began to turn jealous of the growing power of the Macedonian monarch. The Persian kings had been accustomed to regard those of Macedon as their faithful allies ; but the good fortune of Philip, the continual clamour of the Athenians against him, and his dethroning at pleasure the petty princes of Thrace, made him now regarded in another light. When therefore he led his troops against Perinthus, the Great King, as he was styled by the Greeks, sent his letters mandatory to the governors of the maritime provinces, directing them to supply the place with all things in their power ; in consequence of which they filled it with troops, granted subsidies in ready money, and sent besides great convoys of provision and ammunition. The Byzantines also, supposing their own turn would be next, exerted their utmost endeavours for the preservation of Perinthus ; sending thither the flower of their youth, with all other necessaries for an obstinate defence. The consequence of all this was, that Philip found himself obliged to raise the siege with great loss.

That the reputation of the Macedonian arms might not sink by this disgrace, Philip made war on the Scythians and Triballi, both of whom he defeated ; and then formed a design of invading Attica, though he had no fleet to transport his troops, and knew very well that the Thessalians were not to be depended upon if he attempted to march through the Pissæ, and that the Thebans would even then be ready to oppose his march. To obviate all these difficulties, he had recourse to Athens itself ; where, by means of his partisans, he procured his old friend Æschines to be sent their deputy to the Amphictyons. This seemed a small matter, and yet was the hinge on which his whole project turned. By that time Æschines had taken his seat, a question was stirred in the council, whether the Locrians of Amphissia had not been guilty of sacrilege in ploughing the fields of Cyrrha in the neighbourhood of the temple of Delphi. The assembly being divided in their opinions, Æschines proposed to take a view, which was accordingly decreed. But when the Amphictyons came in order to see how things stood, the Locrians, either jealous of their property, or spurred thereto by the suggestions of some who saw farther than themselves, fell upon those venerable persons so rudely, that they compelled them to secure themselves by flight. The Amphictyons decreed, that an army should be raised, under the command of one of their own number, to chastise the delinquents ; but as this army was to be composed of troops sent from all parts of Greece, the appearance at the rendezvous was so inconsiderable, that the Amphictyons sent to command them durst undertake nothing. The whole matter being reported to the council, Æschines, in a long and eloquent harangue, shewed how much the welfare and even the safety of Greece depended on the deference paid to their decrees ; and after inveighing against the want of public spirit in such as had not sent their quotas at the time appointed by the council,

Macedon.

cil, he moved that they should elect Philip for their general, and pray him to execute their decree. The deputies from the other states, conceiving that by this expedient their respective constituents would be free from any farther trouble or expence, came into it at once; whereupon a decree was immediately drawn up, purporting that ambassadors should be sent to Philip of Macedon in the name of Apollo and the Amphictyons, once more to require his assistance, and to notify to him, that the states of Greece had unanimously chosen him their general, with full power to act as he thought fit against such as had opposed the authority of the Amphictyons. Thus of a sudden Philip acquired all that he sought; and having an army ready in expectation of this event, he immediately marched to execute the commands of the Amphictyons in appearance, but in reality to accomplish his own designs. For having passed into Greece with his army, instead of attacking the Locrians, he seized immediately upon Elatea a great city of Phocis upon the river Cephissus.

27  
Whom he  
defeats at  
Cheronæa.

The Athenians in the mean time were in the utmost confusion on the news of Philip's march. However, by the advice of Demosthenes, they invited the Thebans to join them against the common enemy of Greece. Philip endeavoured as much as possible to prevent this confederacy from taking place; but all his efforts proved ineffectual. The Athenians raised an army, which marched immediately to Eleusis, where they were joined by the Thebans. The confederates made the best appearance that had ever been seen in Greece, and the troops were exceedingly good; but unfortunately the generals were men of no conduct, or skill in the military art. An engagement ensued at Cheronæa; wherein Alexander commanded one wing of the Macedonian army, and his father Philip the other. The confederate army was divided according to the different nations of which it consisted; the Athenians having the right, and the Boeotians the left. In the beginning of the battle the confederates had the better; whereupon Stratocles an Athenian commander cried out, "Come on, brother soldiers, let us drive them back to Macedon;" which being overheard by the king, he said very coolly to one of his officers, "These Athenians do not know to conquer." Upon this he directed the files of the phalanx to be straitened; and, drawing his men up very close, retired to a neighbouring eminence; from whence, when the Athenians were eager in their pursuit, he rushed down with impetuosity, broke, and routed them with prodigious slaughter. The orator Demosthenes behaved very unbecomingly in this engagement; for he deserted his post, and was one of the first that fled: nay, we are told, that a stake catching hold of his robe, he, not doubting but it was an enemy, cried out, "Alas! spare my life."

28  
Is appointed  
general  
against the  
Persians.

This victory determined the fate of Greece, and from this time we must reckon Philip supreme lord of all the Grecian states. The first use he made of his power was to convoke a general assembly, wherein he was recognized generalissimo, and with full power appointed their leader against the Persians. Having, by virtue of his authority, settled a general peace among them, and appointed the quota that each of the states should furnish for the war, he dismissed them; and returning to Macedon, began to make great prepara-

tions for this new expedition. His pretence for making war on the Persians at this time was the assistance given by the Persians to the city of Perinthus, as already mentioned. In the mean time, however, the king, by reason of the dissensions which reigned in his family, was made quite miserable. He quarrelled with his wife Olympias to such a degree, that he divorced her, and married another woman named *Cleopatra*. This produced a quarrel between him and his son Alexander; which also came to such an height, that Alexander retired into Epirus with his mother. Some time afterwards, however, he was recalled, and a reconciliation took place in appearance; but in the mean time a conspiracy was formed against the king's life, the circumstances and causes of which are very much unknown. Certain it is, however, that it took effect, as the king was exhibiting certain shows in honour of his daughter's marriage with the king of Epirus. Philip, having given a public audience to the ambassadors of Greece, went next day in state to the theatre. All the seats were early taken up; and the shews began with a splendid procession, wherein the images of the 12 superior deities of Greece were carried, as also the image of Philip, habited in like manner, as if he now made the 13th, at which the people shouted aloud. Then came the king alone, in a white robe, crowned, with his guards at a considerable distance, that the Greeks might see he placed his safety only in his confidence of the loyalty of his subjects. Pausanias, the assassin, however, had fixed himself close by the door of the theatre; and observing that all things fell out as he had foreseen they would, took his opportunity when the king drew near him, and plunging his sword in his left side, laid him dead at his feet. He then fled, as fast as he was able, towards the place where his horses were; and would have escaped, had not the twig of a vine caught his shoe, and thrown him down. This gave time to those who pursued him to come up with him; but instead of securing him, in order to extort a discovery of his accomplices, they put an end to his life.

29  
Is mur-  
dered.

No sooner did this news reach Athens, than, as if Extrava-  
all danger had been past, the inhabitants shewed the  
most extravagant signs of joy. Demosthenes and his  
party put on chaplets of flowers, and behaved as if  
they had gained a great victory. Phocion reproved  
them for this madness; bidding them remember, that  
"the army which had beaten them at Cheronæa was  
lessened but by one." This reproof, however, had  
very little effect. The people heard with pleasure all  
the harsh things which the orators could say of the  
young Alexander king of Macedon, whom they re-  
presented as a giddy wrong-headed boy, ready to grasp  
all things in his imagination, and able to perform no-  
thing. The affairs of Macedon indeed were in a very  
distracted state on the accession of Alexander: for all  
the neighbouring nations had the same notion of the  
young king with the Athenians; and being irritated  
by the usurpations of Philip, immediately revolted;  
and the states of Greece entered into a confederacy  
against him. The Persians had been contriving to  
transfer the war into Macedon; but as soon as the  
news of Philip's death reached them, they behaved as  
if all danger had been over. At the same time Atta-  
lus, one of the Macedonian commanders, aspired to the  
crown,

Macedon.

Macedon. crown, and fought to draw off the soldiers from their allegiance.

In the councils held on this occasion, Alexander's best friends advised him rather to make use of dissimulation than force, and to cajole those whom they thought he could not subdue. These advices, however, were ill-suited to the temper of their monarch. He thought that vigorous measures only were proper, and therefore immediately led his army into Thessaly. Here he hara-zed the princes so effectually, that he thoroughly gained them over to his interest, and was by them declared general of Greece; upon which he returned to Macedon, where he caused Attalus to be seized and put to death.

In the spring of the next year (335 B. C.) Alexander resolved to subdue the Triballians and Illyrians, who inhabited the countries now called *Bulgaria* and *Slavonia*, and had been very formidable enemies to the Macedonian power. In this expedition he discovered, though then but 20 years of age, a surprising degree of military knowledge. Having advanced to the passes of Mount Hæmus, he found that the barbarians had posted themselves in the most advantageous manner. On the tops of the cliffs, and at the head of every passage, they had placed their carriages and waggons in such a manner as to form a kind of parapet with their shafts inwards, that, when the Macedonians should have half ascended the rock, they might be able to push these heavy carriages down upon them. They reckoned the more upon this contrivance, because of the close order of the phalanx, which, they imagined, would be terribly exposed by the soldiers wanting room to stir, and thereby avoid the falling waggons. But Alexander, having directed his heavy-armed troops to march, gave orders, that, where the way would permit, they should open to the right and left, and suffer the carriages to go through; but that, in the narrow passes, they should throw themselves on their faces with their shields behind them, that the carts might run over them. This had the desired effect; and the Macedonians reached the enemies works without the loss of a man. The dispute was then quickly decided; the barbarians were driven from their posts with great slaughter, and left behind them a considerable booty for the conquerors.

The next exploits of Alexander were against the Getæ, the Taurantii, and some other nations inhabiting the country on the other side of the Danube. Them he also overcame; showing in all his actions the most perfect skill in military affairs, joined with the greatest valour. In the mean time, however, all Greece was in commotion by a report which had been confidently spread abroad, that the king was dead in Illyria. The Thebans, on this news, seized Amyntas and Timolæus, two eminent officers in the Macedonian garrison which held their citadel, and dragged them to the market-place, where they were put to death without either form or process, or any crime alleged against them. Alexander, however, did not suffer them to remain long in their mistake. He marched with such expedition, that in seven days he reached Pallene in Thessaly; and in six days more he entered Boeotia, before the Thebans had any intelligence of his passing the straits of Thermopylæ. Even then they would not believe that the king was alive; but insisted that the

Macedonian army was commanded by Antipater, or by one Alexander the son of Æropus. The rest of the Greeks, however, were not so hard of belief; and therefore sent no assistance to the Thebans, who were thus obliged to bear the consequences of their own folly and obstinacy. The city was taken by storm, and the inhabitants were for some hours massacred without distinction of age or sex; after which the houses were demolished, all except that of Pindar the famous poet, which was spared out of respect to the merit of its owner, and because he had celebrated Alexander I. king of Macedon. The lands, excepting those destined to religious uses, were shared among the soldiers, and all the prisoners sold for slaves; by which 440 talents were brought into the king's treasury.

By this severity the rest of the Grecian states were so thoroughly humbled, that they thought no more of making any resistance, and Alexander had nothing further to hinder him from his favourite project of invading Asia. Very little preparation was necessary for the Macedonian monarch, who went out as to an assured conquest, and reckoned upon being supplied only by the spoils of his enemies. Historians are not agreed as to the number of his army. Arrian says, that there were 30,000 foot and 5000 horse. Diodorus Siculus tells us, that there were 13,000 Macedonian foot, 7000 of the confederate states, and 5000 mercenaries. These were under the command of Parmenio. Of the Odrysians, Triballians, and Illyrians, there were 5000; and of the Agrians, who were armed only with darts, 1000. As for the horse, he tells us there were 1800 commanded by Philotas; and as many Thessalians, under the command of Callas: out of the confederate states of Greece, were 600 commanded by Eurgyrius; and 900 Thracians and Peonians, who led the van under Cassander. Plutarch tells us, that, according to a low computation, he had 30,000 foot and 5000 horse; and, according to the largest reckoning, he had 34,000 foot and 4000 horse. As to his fund for the payment of the army, Aristobolus says it was but 70 talents; and Onesicritus, who was also in this expedition, not only takes away the 70 talents, but affirms that the king was 200 in debt. As for provisions, there was just sufficient for a month and no more; and to prevent disturbances, Antipater was left in Macedon with 12,000 foot and 1500 horse.

The army having assembled at Amphipolis, he marched from thence to the mouths of the river Strymon; then crossing mount Pangæus, he took the road to Abdera. Crossing the river Eubrus, he proceeded through the country of Pædis, and in 20 days reached Scythia; thence he came to Eleus, where he sacrificed on the tomb of Proteus, because was the first among the Greeks who, at the siege of Troy, set foot on the Asiatic shore. He did this, that his landing might be more propitious than that of the hero to whom he sacrificed, who was slain soon after. The greatest part of the army, under the command of Parmenio, embarked at Scythia, on board a fleet of 160 galleys of three benches of oars, besides small craft. Alexander himself sailed from Eleus; and, when he was in the middle of the Hellespont, offered a bull to Neptune and the Nereids, pouring forth at the same time a libation from a golden cup. When he drew near the shore, he launched a javelin, which stuck in the earth: then, in

36 Sets out on his expedition.

*Macedon.* complete armour, he leaped upon the strand; and, having erected altars to Jupiter, Minerva, and Hercules, he proceeded to Ilium. Here again he sacrificed to Minerva; and taking down some arms which had hung in the temple of that goddess since the time of the Trojan war, consecrated his own in their stead. He sacrificed also to the ghost of Priam, to avert his wrath on account of the descent which he himself claimed from Achilles.

In the mean time the Persians had assembled a great army in Phrygia; among whom was one Memnon a Rhodian, the best officer in the service of Darius. Alexander, as soon as he had performed all the ceremonies which he judged necessary, marched directly towards the enemy. Memnon gave it as his opinion, that they should burn and destroy all the country round, that they might deprive the Greeks of the means of subsisting, and then transport a part of their army into Macedonia. But the Persians, depending on their cavalry, rejected this salutary advice; and posted themselves along the river Granicus, in order to wait the arrival of Alexander. In the engagement which happened on the banks of that river, the Persians were defeated\*, and Alexander became master of all the neighbouring country; which he immediately began to take care of, as if it had been part of his hereditary dominions. The city of Sardis was immediately delivered up; and here Alexander built a temple to Jupiter Olympias. After this, he restored the Ephesians to their liberty; ordered the tribute which they formerly paid to the Persians to be applied towards the rebuilding of the magnificent temple of Diana; and having settled the affairs of the city, marched against Miletus. This place was defended by Memnon with a considerable body of troops who had fled thither after the battle of Granicus, and therefore made a vigorous resistance. The fortune of Alexander, however, prevailed; and the city was soon reduced, though Memnon with part of the troops escaped to Halicarnassus. After this, the king dismissed his fleet, for which various reasons have been assigned; though it is probable, that the chief one was to show his army that their only resource now was in subverting the Persian empire.

Almost all the cities between Miletus and Halicarnassus submitted as soon as they heard that the former was taken; but Halicarnassus, where Memnon commanded with a very numerous garrison, made an obstinate defence. Nothing, however, was able to resist the Macedonian army. Memnon was at last obliged to abandon the place: upon which Alexander took and razed the city of Tralles in Phrygia; received the submission of several princes tributary to the Persians; and having destroyed the Marmarians, a people of Lycia who had fallen upon the rear of his army, put an end to the campaign: after which he sent home all the new-married men; in obedience, it would seem, to a precept of the Mosaic law, and which endeared him more to his soldiers than any other action of his life.

As soon as the season would permit, Alexander quitted the province of Phælium; and having sent part of his army through the mountainous country to Perga, by a short but difficult road, took his route by a certain promontory, where the way is altogether impassable, except when the north winds blow. At the

time of the king's march the south wind had held for long time; but of a sudden it changed, and blew from the north so violently, that, as he and his followers declared, they obtained a safe and easy passage through the divine assistance. By many this march is held to be miraculous, and compared to that of the children of Israel through the Red Sea; while, on the other hand, it is the opinion of others, that there was nothing at all extraordinary in it. He continued his march towards Gordium, a city of Phrygia; the enemy having abandoned the strong pass of Telmissus, through which it was necessary for him to march. When he arrived at Gordium, and finding himself under a necessity of staying some time there till the several corps of his army could be united, he expressed a strong desire of seeing Gordius's chariot, and the famous knot in the harness, of which such strange stories had been published to the world. The cord in which this knot was tied, was made of the inner rind of the cornel-tree; and no eye could perceive where it had begun or ended. Alexander, when he could find no possible way of untying it, and yet was unwilling to leave it tied lest it should cause some fears in the breasts of his soldiers, is said by some authors to have cut the cords with his sword, saying, "It matters not how it is undone." But Aristobolus assures us, that the king wrested a wooden pin out of the beam of the waggon, which, being driven in across the beam, held it up; and so took the yoke from under it. Be this as it will, however, Arrian informs us, that a great tempest of thunder, lightning, and rain, happening the succeeding night, it was held declarative of the true solution of this knot, and that Alexander should become lord of Asia.

The king having left Gordium, marched towards Cilicia; where he was attended with his usual good fortune, the Persians abandoning all the strong passes as he advanced. As soon as he entered the province, he received advice that Artanes, whom Darius had made governor of Tarsus, was about to abandon it, and that the inhabitants were very apprehensive that he intended to plunder them before he withdrew. To prevent this, the king marched incessantly, and arrived just in time to save the city. But his saving it had well nigh cost him his life: for, either through the excessive fatigue of marching, as some say, or, according to others, by his plunging when very hot into the river Cydnus, which, as it runs through thick shades, has its waters excessively cold, he fell into such a distemper as threatened his immediate dissolution. His army lost their spirits immediately; the generals knew not what to do; and his physicians were so much affrighted, that the terror of his death hindered them from using the necessary methods for preserving his life. Philip the Acarnanian alone preserved temper enough to examine the nature of the king's disease; the worst symptom of which was a continual waking, and which he took off by means of a potion, and in a short time the king recovered his usual health.

Soon after Alexander's recovery, he received the agreeable news that Ptolemy and Alexander had defeated the Persian generals, and made great conquests on the Hellespont; a little after that, he met the Persian army at Issus, commanded by Darius himself. A bloody engagement ensued, in which the Persians were de-  
feated

40 Tyre taken and destroyed.

Macedon. feated with great slaughter, as related under the article *Issus*. The consequences of this victory were very advantageous to the Macedonians. Many governors of provinces and petty princes submitted themselves to the conqueror; and such as did so were treated, not as a newly-conquered people, but as his old hereditary subjects; being neither burthened with soldiers, nor oppressed with tribute. Among the number of those places which, within a short space after the battle of Issus, sent deputies to submit to the conqueror, was the city of Tyre. The king, whose name was Azelmicus, was absent in the Persian fleet; but his son was among the deputies, and was very favourably received by Alexander. The king probably intended to confer particular honours on the city of Tyre; for he acquainted the inhabitants that he would come and sacrifice to the Tyrian Hercules, the patron of their city, to whom they had erected a most magnificent temple. But these people, like most other trading nations, were too suspicious to think of admitting such an enterprising prince with his troops within their walls. They sent therefore their deputies again to him, to inform him, that they were ready to do whatever he should command them; but, as to his coming and sacrificing in their city, they could not consent to that, but were positively determined not to admit a single Macedonian within their gates. Alexander immediately dismissed their deputies in great displeasure. He then assembled a council of war, wherein he insisted strongly on the disaffected state of Greece, (for most of the Grecian states had sent ambassadors to Darius, to enter into a league with him against the Macedonians,) the power of the Persians by sea, and the folly of carrying on the war in distant provinces, while Tyre was left unredressed behind them: he also remarked, that if once this city was subdued, the sovereignty of the sea would be transferred to them, because it would fix their possession of the coasts; and as the Persian fleet was composed chiefly of tributary squadrons, those tributaries would fight the battles, not of their late, but of their present masters. For these reasons the siege of Tyre was resolved on. The town was not taken, however, without great difficulty; which provoked Alexander to such a degree, that he treated the inhabitants with the greatest cruelty. See *TYRE*.

After the reduction of Tyre, Alexander, though the season was already far advanced, resolved to make an expedition into Syria; and in his way thither proposed to chastise the Jews, who had highly offended him during the siege of Tyre: for when he sent to them to demand provisions for his soldiers, they answered, that they were the subjects of Darius, and bound by oath not to supply his enemies. The king, however, was pacified by their submission; and not only pardoned them, but conferred many privileges upon them, as related under the article *Jews*.

41 Egypt sub-  
mits.

From Jerusalem Alexander marched directly to Gaza, the only place in that part of the world which still held out for Darius. This was a very large and strong city, situated on an high hill, about five miles from the sea shore. One *Batis*, or *Betis*, an eunuch, had the government of the place; and had made every preparation necessary for sustaining a long and obstinate siege. The governor defended the place

Macedon- with great valour, and several times repulsed his enemies: but at last it was taken by storm, and all the garrison slain to a man; and this secured to Alexander an entrance into Egypt, which having before been very impatient of the Persian yoke, admitted the Macedonians peaceably.

42 Alexander visits the temple of Jupiter Ammon.

Here the king laid the foundations of the city of Alexandria, which for many years after continued to be the capital of the country. While he remained here, he also formed the extraordinary design of visiting the temple of Jupiter Ammon. As to the motives by which he was induced to take this extraordinary journey, authors are not agreed; but certain it is, that he hazarded himself and his troops in the highest degree; there being two dangers in this march, which, with the example of Cambyfes, who lost the greatest part of his army in it, might have terrified any body but Alexander. The first was the want of water, which, in the sandy deserts surrounding the temple, is no where to be found: the other, the uncertainty of the road from the fluctuation of the sands; which, changing their situation every moment, leave the traveller neither a road to walk in, nor mark to march by. These difficulties, however, Alexander got over; though not without a miraculous interpolation, as is pretended by all his historians.

Alexander having consulted the oracle, and received a favourable answer, returned to pursue his conquests. Having settled the government of Egypt, he appointed the general rendezvous of his forces at Tyre. Here he met with ambassadors from Athens, requesting him to pardon such of their countrymen as he found serving the enemy. The king, being desirous to oblige such a famous state, granted their request; and sent also a fleet to the coast of Greece, to prevent the effects of some commotions which had lately happened in Peloponnesus. He then directed his march to Thapfacus; and having passed the Euphrates and Tigris, met with Darius near Arbela, where the Persians were again overthrown with prodigious slaughter \*, and Alexander in effect became master of the Persian empire.

43 Reduces Babylon, Susa, and Persepolis.

After this important victory, Alexander marched directly to Babylon, which was immediately delivered up; the inhabitants being greatly disaffected to the Persian interest. After 30 days stay in this country, the king marched to Susa, which had already surrendered to Philoxenus; and here he received the treasures of the Persian monarch, amounting, according to the most generally received account, to 50,000 talents. Having received also at this time a supply of 6000 foot and 500 horse from Macedon, he set about reducing the nations of Media, among whom Darius was retired. He first reduced the Uxians; and having forced a passage to Persepolis the capital of the empire, he like a barbarian destroyed the stately palace there, a pile of building not to be equalled in any part of the world; after having given up the city to be plundered by his soldiers. In the palace he found 120,000 talents, which he appropriated to his own use, and caused immediately to be carried away upon mules and camels; for he had such an extreme aversion to the inhabitants of Persepolis, that he determined to leave nothing valuable in the city.

During the time that Alexander remained at Persepolis

Macedon.

44  
He pursues  
Darius.

scopolis, he received intelligence that Darius remained at Ecbatana the capital of Media; upon which he pursued him with the greatest expedition, marching at the rate of near 40 miles a-day. In 15 days he reached Ecbatana, where he was informed that Darius had retired from thence five days before, with an intent to pass into the remotest provinces of his empire. This put some stop to the rapid progress of the Macedonian army; and the king perceiving that there was no necessity for hurrying himself and his soldiers in such a manner, began to give the orders requisite in the present situation of his affairs. The Theffalian horse, who had deserved exceedingly well of him in all his battles, he dismissed according to his agreement; gave them their whole pay, and ordered 2000 talents over and above to be distributed among them. He then declared that he would force no man; but if any were willing to serve him longer for pay, he desired they would enter their names in a book, which a great many of them did; the rest fold their horses, and prepared for their departure. The king appointed Epocillus to conduct them to the sea, and assigned him a body of horse as an escort: he likewise sent Menetes with them, to take care of their embarkation, and that they were safely landed in Euboea without any expence to themselves.

On receiving fresh information concerning the state of Darius's affairs, the king set out again in pursuit of him, advancing as far as Rhages, a city one day's journey from the Caspian straits: there he understood that Darius had passed those straits some time before; which information leaving him again without hopes, he halted for five days. Oxidates, a Persian whom Darius had left prisoner at Sufa, was made governor of Media, while the king departed on an expedition into Parthia. The Caspian straits he passed immediately, without opposition; and then gave directions to his officers to collect a quantity of provisions sufficient to serve his army on a long march through a wasted country. But before his officers could accomplish those commands, the king received intelligence that Darius had been murdered by Bessus, one of his own subjects, and governor of Bactria, as is related at length under the article PERSIA.

45  
Who is  
murdered.46  
Alexander  
reduces  
Hyrcania.

As soon as Alexander had collected his forces together, and settled the government of Parthia, he entered Hyrcania; and having, according to his usual custom, committed the greatest part of his army to the care of Craterus, he, at the head of a choice body of troops, passed through certain craggy roads, and before the arrival of Craterus, who took an open and easy path, struck the whole provinces with such terror, that all the principal places were immediately put into his hands, and soon after the province of Aria also submitted, and the king continued Satibarzanes the governor in his employment.—The reduction of this province finished the conquest of Persia; but the ambition of Alexander to become master of every nation of which he had the least intelligence, induced him to enter the country of the *Mardi*, merely because its rocks and barrenness had hitherto hindered any body from conquering, or indeed from attempting to conquer it. This conquest, however, he easily accomplished, and obliged the whole nation to submit to his pleasure. But in the meantime disturbances

began to arise in Alexander's new empire, and among his troops, which all his activity could not thoroughly suppress. He he scarcely left the province of Aria, when he received intelligence, that the traitor Bessus had caused himself to be proclaimed king of Asia by the name of *Artaxerxes*; and that Satibarzanes had joined him, after having massacred all the Macedonians who had been left in the province. Alexander appointed one *Arsanes*, governor in the room of Satibarzanes; and marched thence with his army against the *Zaranges*, who under the command of Barzaentes, one of those who had conspired against Darius, had taken up arms, and threatened to make an obstinate defence. But, their numbers daily falling off, Barzaentes being afraid they would purchase their own safety at the expence of his, privately withdrew from his camp, and, crossing the river Indus, sought shelter among the nations beyond it. But they, either dreading the power of Alexander, or detesting the treachery of this Persian towards his former master, seized and delivered him up to Alexander, who caused him immediately to be put to death.

The immense treasure which the Macedonians had acquired in the conquest of Persia began now to corrupt them. The king himself was of a most generous disposition, and liberally bestowed his gifts on those around him; but they made a bad use of his bounty, and foolishly indulged those vices by which the former possessors of that wealth had lost it. The king did all in his power to discourage the lazy and inactive pride which now began to shew itself among his officers; but neither his discourses nor his example had any considerable effect. The manners of his courtiers from bad became worse, in spite of all he could say or do to prevent it; and at last they proceeded to censure his conduct, and to express themselves with some bitterness on the subject of his long continuance of the war, and his leading them constantly from one labour to another. This came to such an height, that the king was at last obliged use some severity in order to keep his army within the limits of their duty. From this time forward, however, Alexander himself began to alter his conduct; and by giving a little in to the customs of the Orientals, endeavoured to secure that obedience from his new subjects which he found so difficult to be preserved among his old ones. He likewise endeavoured, by various methods, to blend the customs of the Asiatics and the Greeks. The form of his civil government resembled that of the ancient Persian kings; in the military affairs, however, he preserved the Macedonian discipline; but then he made choice of 30,000 boys out of the provinces, whom he caused to be instructed in the Greek language, and directed to be brought up in such a manner as that from time to time he might with them fill up the phalanx. The Macedonians saw with great concern these extraordinary measures which suited very ill with their gross understandings; for they thought, after all the victories they had gained, to be absolute lords of Asia, and to possess not only the riches of its inhabitants, but to rule the inhabitants themselves: whereas they now saw, that Alexander meant no such thing; but that, on the contrary, he conferred governments, offices at court, and all other marks of confidence and favour, indif-

customs.

criminally both on Greeks and Persians.—From this time also the king seems to have given instances of a cruelty he had never shown before. Philotas his most intimate friend was seized, tortured, and put to death for a conspiracy of which it could never be proven that he was guilty; and soon after Parmenio and some others were executed without any crime at all real or alleged. These things very much disturbed the army. Some of them wrote home to Macedonia of the king's suspicions of his friends, and his disposition to hunt out enemies at the very extremities of the world. Alexander having intercepted some of these letters, and procured the best information he could concerning their authors, picked out these dissatisfied people, and having disposed them into one corps, gave it the title of the *turbulent battalion*; hoping by this means to prevent the spirit of disaffection from pervading the whole army.

As a farther precaution against any future conspiracy, Alexander thought fit to appoint Hephæstion and Clytus generals of the auxiliary horse; being apprehensive, that if this authority was lodged in the hands of a single person, it might prompt him to dangerous undertakings, and at the same time furnish him with the means of carrying them into execution. To keep his forces in action, he suddenly marched into the country of the Euergetæ, i. e. *Benefactors*; and found them full of that kind and hospitable disposition, for which that name had been bestowed on their ancestors: he therefore treated them with great respect; and, at his departure added some lands to their dominions, which lay contiguous, and which for that reason they had requested of him.

Turning then to the east, he entered Arachosia, the inhabitants of which submitted without giving him any trouble. While he passed the winter in these parts, the king received advice, that the Arians, whom he had so lately subdued, were again up in arms, Satibarzanes being returned into that country with two thousand horse assigned him by Bessus. Alexander instantly dispatched Artabazus the Persian, with Erigyus and Caranus, two of his commanders, with a considerable body of horse and foot: he likewise ordered Phrataphernes, to whom he had given the government of Parthia, to accompany them. A general engagement ensued, wherein the Arians behaved very well, as long as their commander Satibarzanes lived: but engaging Erigyus, the Macedonian struck him first into the throat, and then, drawing forth his spear again, through the mouth; so that he immediately expired, and with him the courage of his soldiers, who instantly begun to fly; whereupon Alexander's commanders made an easy conquest of the rest of the country, and settled it effectually under his obedience.

The king, notwithstanding the inclemency of the season, advanced into the country of Paropamisus, so called from the mountain Paropamisus, which the soldiers of Alexander called *Caucasus*. Having crossed the country in 16 days, he came at length to an opening leading into Media; which finding of a sufficient breadth, he directed a city to be built there, which he called *Alexandria*, as also several other towns about a day's journey distant from thence: and in these places he left 7000 persons, part of them such

as had hitherto followed his camp, and part of the mercenary soldiers, who, weary of continual fatigue, were content to dwell there. Having thus settled things in this province, sacrificed solemnly to the gods, and appointed Proxenes the Persian president thereof, with a small body of troops under the command of Niloxenus to assist him, he resumed his former design of penetrating into Bactria.

Bessus, who had assumed the title of *Artaxerxes*, when he was assured that Alexander was marching towards him, immediately began to waste all the country between Paropamisus and the river Oxus; which river he passed with his forces, and then burnt all the vessels he had made use of for transporting them, retiring to Nautaca a city of Sogdia; fully persuaded, that, by the precautions he had taken, Alexander would be compelled to give over his pursuit. This conduct of his, however, disheartened his troops, and gave the lie to all his pretensions; for he had affected to censure Darius's conduct, and had charged him with cowardice, in not defending the rivers Euphrates and Tigris, whereas he now quitted the banks of the most defensible river perhaps in the whole world. As to his hopes, tho' it cannot be said they were ill founded, yet they proved absolutely vain; for Alexander, continuing his march, notwithstanding all the hardships his soldiers sustained, reduced all Bactria under his obedience, particularly the capital Bactria and the strong castle Aornus: in the latter he placed a garrison under the command of Archelaus; but the government of the province he committed to Artabazus. He then continued his march to the river Oxus: on the banks of which, when he arrived, he found it three quarters of a mile over, its depth more than proportionable to its breadth, its bottom sandy, its stream so rapid as to render it almost un navigable, and neither boat nor tree in its neighbourhood; so that the ablest commanders in the Macedonian army were of opinion that they should be obliged to march back. The king, however, having first sent away, under a proper escort, all his infirm and worn-out soldiers, that they might be conducted safe to the sea-ports, and from thence to Greece, devised a method of passing this river without either boat or bridge, by causing the hides which covered the soldiers tents and carriages to be stuffed with straw, and then tied together and thrown into the river. Having crossed the Oxus, he marched directly towards the camp of Bessus, where, when he arrived, he found it abandoned; but received at the same time letters from Spitamenes and Dataphernes, who were the chief commanders under Bessus, signifying, that, if he would send a small party to receive Bessus, they would deliver him into his hands; which they did accordingly, and the traitor was put to death in the manner related in the history of Persia.

A supply of horses being now arrived, the Macedonian cavalry were remounted. Alexander continued his march to Maracanda the capital of Sogdia, from whence he advanced to the river Iaxartes. Here he performed great exploits against the Scythians; from whom, however, tho' he overcame them, his army suffered much; and the revolted Sogdians being headed by Spitamenes, gave him a great deal of trouble. Here he married Roxana the daughter of Oxyartes, a prince of the country whom he had subdued. But du-

25  
Passes the  
Indus,

ring these expeditions, the king greatly disgraced his army by the murder of his friend Clytus in a drunken quarrel at a banquet, and by his extravagant vanity in claiming divine honours.

At last he arrived at the river Indus, where Hephæstion and Perdicas had already provided a bridge of boats for the passage of the army. The king refreshed his troops for 30 days in the countries on the other side of the river, which were those of his friend and ally Taxiles, who gave him 30 elephants, and joined his army now with 700 Indian horse, to which, when they were to enter upon action, he afterwards added 5000 foot. The true reason of this seems to have been his enmity to Porus, a famous Indian prince, whose territories lay on the other side of the river Hydaspes. During this recess, the king sacrificed with great solemnity; receiving also ambassadors from Ambivrus a very potent prince, and from Doxareas, who was likewise a king in those parts, with tenders of their duty, and considerable presents. These ceremonies over, Alexander appointed Philip governor of Taxila, and put a Macedonian garrison into the place, because he intended to erect an hospital there for the cure of his sick and wounded soldiers. He then ordered the vessels, of which his bridge had been composed when he passed the Indus, to be taken to pieces, that they might be brought to the Hydaspes, where he was informed that Porus with a great army lay encamped to hinder his passage. When he approached the banks of this river with his army and the auxiliaries under the command of Taxiles, he found that the people he had to do with were not so easily to be subdued as the Persians and other Asiatics. The Indians were not only a very tall and robust, but also a very hardy and well-disciplined people; and their king Porus, was a prince of high spirit, invincible courage, and great conduct.

It was about the summer-solstice when Alexander reached the Hydaspes, and consequently its waters were broader, deeper, and more rapid, than at any other time; for in India the rivers swell as the sun's increasing heat melts the snow, and subside again as winter approaches. Alexander therefore had every difficulty to struggle with. Porus had made his dispositions so judiciously, that Alexander found it impossible to practise upon him as he had done upon others, and to pass the river in his view: wherefore he was constrained to divide his army into small parties, and to practise other arts, in order to get the better of so vigilant a prince. To this end he caused a great quantity of corn and other provisions to be brought into his camp; giving out, that he intended to remain where he was till the river fell, and by becoming fordable should give him an opportunity of forcing a passage: this did not, however, hinder Porus from keeping up very strict discipline in his camp; which when Alexander perceived, he frequently made such motions as seemed to indicate a change of his resolution, and that he had still thoughts of passing the river. The main thing the Macedonians stood in fear of were the elephants; for the bank being pretty steep on the other side, and it being the nature of horses to start at the first appearance of those animals, it was foreseen that the army would be disordered, and incapable of sustaining the charge of Porus's troops.

At length Alexander passed the river by the fol-

lowing contrivance. There was, at the distance of 150 stadia from his camp, a rocky promontory projecting into the river, thick covered with wood; and over-against this promontory there lay a pretty large uninhabited island almost overgrown with trees. The king therefore conceived within himself a project of conveying a body of troops from this promontory into that island; and upon this scheme he built his hopes of surprising Porus, vigilant as he was. To this end he kept him and his army constantly alarmed for many nights together, till he perceived that Porus apprehended it was only done to harass his troops, and therefore no longer drew out of his camp, but trusted to his ordinary guards: then Alexander resolved to put his design in execution. A considerable body of horse, the Macedonian phalanx, with some corps of light-armed foot, he left in his camp under the command of Craterus, as also the auxiliary Indians: giving these orders to be observed in his absence, that if Porus marched against him with part of his army and left another part with the elephants behind in his camp, Craterus and his forces should remain where they were; but if it so happened that Porus withdrew his elephants, then Craterus was to pass the river, because his cavalry might then do it safely. Alexander having marched half the way, or about nine of our miles, ordered the mercenary troops under the command of Attalus and other generals, to remain there; and directed them, that as soon as they knew he was engaged with the Indians on the other side, they should pass in vessels provided for that purpose, in order to assist him. Then marching a long way about, that the enemy might not perceive his design of reaching the rock, he advanced as diligently as he could towards that post. It happened very fortunately for him, that a great storm of thunder, lightning, and hail, rose in the night, whereby his march was perfectly concealed, his vessels of 30 oars put together, and his tents stuffed and stitched, so that they passed from the rock into the island, without being perceived, a little before break of day; the storm ceasing just as he and his soldiers were ready for their passage. When they had traversed the island, they boldly set forward to gain the opposite shore in sight of Porus's out-guards, who instantly posted away to give their master an account of the attempt. Alexander landed first himself; and was followed as expeditiously as possible by his forces, whom he took care to draw up as fast as they arrived. When they began their march again, they found that their good fortune was not so great as at first they esteemed it; for it appeared now, that they had not reached the continent at all, but were in truth in another island much larger than the former. They crossed it as fast as they could, and found that it was divided from the *terra firma* by a narrow channel, which, however, was so swelled by the late heavy rain, that the poor soldiers were obliged to wade up to the breast. When they were on the other side, the king drew them up again carefully, ordering the foot to march slowly, they being in number about 6000, while himself with 5000 horse advanced before. As soon as Porus received intelligence that Alexander was actually passing the river, he sent his son with 2000 horse, and 120 armed chariots, to oppose him. But they came too late: Alexander was already got on shore, and even on his march.

The son of  
Porus de-  
feated and  
killed.

When the Macedonian scouts perceived them advance, they informed the king, who sent a detachment to attack them, remaining still at the head of his cavalry in expectation of Porus. But when he found that this party was unsupported, he instantly attacked with all his horse, and defeated them with the slaughter of many, and the loss of all their armed chariots, the son of Porus being slain in the fight. The remainder of the horse returning to the camp with this disastrous account, Porus was in some confusion: however, he took very quickly the best and wisest resolutions his circumstances would allow; which were, to leave a part of his army, with some of his elephants, to oppose Craterus, who was now about to pass the river also; and, with the rest, to march against Alexander and his forces, who were already passed. This resolution once taken, he marched immediately out of his camp, at the head of 4000 horse, 30,000 foot, 300 chariots, and 200 elephants. He advanced as expeditiously as he could, till he came into a plain which was firm and sandy, where his chariots and elephants might act to advantage: there he halted, that he might put his army in order, knowing well that he need not go in quest of his enemy. Alexander soon came up with his horse, but he did not charge Porus; on the contrary, he halted, and put his troops in order, that they might be able to defend themselves in case they were attacked. When he had waited some time, his foot arrived; whom he immediately surrounded with his horse, that, after so fatiguing a march, they might have time to cool and breathe themselves, before they were led to engage. Porus permitted all this, because it was not his interest to fight, and because he depended chiefly upon his order of battle, the elephants covering his foot, so that the Macedonians could not charge them.

55  
Porus him-  
self defeat-  
ed.

When Alexander had disposed his foot in proper order, he placed his horse on the wings; and, observing that he was much superior in them to the enemy, and that the cavalry of Porus were easy to be charged, he resolved to let the foot have as little share as possible in the battle. To this end, having given the necessary directions to Cœnus who commanded them, he went himself to the right, and with great fury fell upon the left wing of Porus. The dispute, tho' short, was very bloody: the cavalry of Porus, tho' they fought gallantly, were quickly broken; and the foot being by this means uncovered, the Macedonians charged them. But the Indian horse rallying, came up to their relief, yet were again defeated. By this time the archers had wounded many of the elephants, and killed most of their riders, so that they did not prove less troublesome and dangerous to their own side than to the Macedonians; whence a great confusion ensued, and Cœnus, taking this opportunity, fell in with the troops under his command, and entirely defeated the Indian army. Porus himself behaved with the greatest intrepidity, and with the most excellent conduct: he gave his orders, and directed every thing, as long as his troops retained their form; and, when they were broken, he retired from party to party as they made stands, and continued fighting till every corps of Indians was put to the rout. In the mean time Craterus had passed with the rest of the Macedonian army; and there, falling upon the flying Indians, increased the slaughter

of the day excessively, inasmuch that 20,000 foot and 3000 horse were killed, all the chariots were hacked to pieces, and the elephants not killed were taken: 20 of Porus's sons fell here, as also most of his officers of all ranks.

As for Porus, Alexander gave strict directions that no injury might be done to his person: he even sent Taxiles to persuade him to surrender himself, and to assure him that he should be treated with all the kindness and respect imaginable; but Porus, disdainful this advice from the mouth of an old enemy, threw a javelin at him, and had killed him, but for the quick turn of his horse. Meroë the Indian, who was also in the service of Alexander, succeeded better: he had been the old acquaintance of Porus; and therefore, when he intreated that prince to spare his person, and to submit himself to fortune and a generous victor, Porus followed his advice; and we may truly say, that the condition of this Indian king suffered nothing by the loss of the battle. Alexander immediately gave him his liberty, restored him shortly after to his kingdom, to which he annexed provinces almost equal to it in value. Neither was Alexander a loser by his munificence; for Porus remained his true friend and constant ally.

To perpetuate the memory of this victory, Alexander ordered two cities to be erected; one on the field of battle, which he named *Nicaa*; the other on this side the river, which he called *Bucephala*, in honour of his horse Bucephalus, who died here, as Arrian says, of mere old age, being on the verge of 30. All the soldiers, who fell in battle, he buried with great honours; offered solemn sacrifices to the gods, and exhibited pompous shows on the banks of the Hydaspes, where he had forced his passage. He then entered the territories of the Gausei, in which were 37 good cities, and a multitude of populous villages. All these were delivered up to him without fighting; and as soon as he received them, he presented them to Porus; and having reconciled him to Taxiles, he sent the latter home to his own dominions. About this time ambassadors arrived from some Indian princes with their submissions; and Alexander, having conquered the dominions of another Porus, which lay on the Hydraotes a branch of the Indus, added them to those of Porus his ally.

In the middle of all this success, however, news arrived, that the Cathi, the Oxydrace, and the Malli, the most warlike nations of India, were confederated against the Macedonians, and had drawn together a great army. The king immediately marched to give them battle; and in a few days reached a city called *Sangala*, seated on the top of an hill, and having a fine lake behind it. Before this city the confederate Indians lay encamped, having three circular lines of carriages locked together, and their tents pitched in the centre. Notwithstanding the apparent difficulty of forcing these intrenchments, Alexander resolved immediately to attack them. The Indians made a noble defence; but at last the first line of their carriages was broken, and the Macedonians entered. The second was stronger by far; yet Alexander attacked that too, and, after a desperate resistance, forced it. The Indians, without trusting to the third, retired into the city; which Alexander would have invested: but the

foot

Macedon. foot he had with him not being sufficient for that purpose, he caused his works to be carried on both sides as far as the lake; and, on the other side of that, ordered several brigades of horse to take post; ordering also battering engines to be brought up, and in some places employing miners. The second night, he received intelligence that the besieged, knowing the lake to be fordable, intended to make their escape through it. Upon this the king ordered all the carriages which had been taken in forcing their camp to be placed up and down the roads, in hopes of hindering their flight; giving directions to Ptolemy, who commanded the horse on the other side of the lake, to be extremely vigilant, and to cause all his trumpets to sound, that the forces might repair to that post where the Indians made their greatest effort. These precautions had all the effect that could be desired: for of the few Indians who got through the lake, and passed the Macedonian horse, the greater part were killed on the roads; but the greatest part of their army was constrained to retire again through the water into the city. Two days after, the place was taken by storm. Seventeen thousand Indians were killed; 70,000 taken prisoners; with 300 chariots, and 500 horse. The Macedonians are said to have lost only 100 men in this siege; but they had 1200 wounded, and among these several persons of great distinction.

The city was no sooner taken, than Alexander dispatched Eumenes his secretary, with a party of horse, to acquaint the inhabitants of the cities adjacent with what had befallen the Sangalans; promising also, that they should be kindly treated if they would submit. But they were so much affrighted at what had happened to their neighbours, that, abandoning all their cities, they fled into the mountains; choosing rather to expose themselves to wild beasts, than to these invaders, who had treated their countrymen so cruelly. When the king was informed of this, he sent detachments of horse and foot to scour the roads; and these, finding aged, infirm, and wounded people, to the number of about 500, put them to the sword without mercy. Perceiving that it was impossible to persuade the inhabitants to return, he caused the city of Sangala to be razed, and gave the territories to the few Indians who had submitted to him.

Alexander, still unsated with conquest, now prepared to pass the Hyphasis. The chief reason which induced him to think of this expedition was, the information he had received of the state of the countries beyond that river. He was told that they were in themselves rich and fruitful; that their inhabitants were not only a very martial people, but very civilized; that they were governed by the nobility, who were themselves subject to the laws; and that, as they lived in happiness and freedom, it was likely they would fight obstinately in defence of those blessings. He was farther told, that, among these nations there were the largest, strongest, and most useful elephants bred and tamed; and was therefore fired with an earnest desire to reduce such a bold and brave people under his rule, and of attaining to the possession of the many valuable things that were said to be amongst them. As exorbitant, however, as his personal ambition was, he found it impossible to infuse any part of it into the

minds of his soldiers; who were so far from wishing to triumph over new and remote countries, that they were highly desirous of leaving those that they had already conquered. When therefore they were informed of the king's intentions, they privately consulted together in the camp about the situation of their own affairs. At this consultation, the gravell and best of the soldiers lamented that they were made use of by their king, not as lions, who fall fiercely upon those who have injured them; but as maddiffs, who fly upon and tear those who are pointed out to them as enemies. The rest were not so modest; but expressed themselves roundly against the king's humour for leading them from battle to battle, from siege to siege, and from river to river; protesting that they would follow him no further, nor lavish away their lives any longer, to purchase fame for him.

Alexander was a man of too much penetration not to be early in perceiving that his troops were very uneasy. He therefore harangued them from his tribunal; but though his eloquence was great, and the love his army had for him was yet very strong, they did not relent. For some time the soldiers remained sullen and silent; and at last turned their eyes on Cœnus, an old and experienced general, whom Alexander loved, and in whom the army put great confidence.—He had the generosity to undertake their cause; and told Alexander frankly, “that men endured toil in hopes of repose; that the Macedonians were already much reduced in their numbers; that of those who remained, the greater part were invalids; and that they expected, in consideration of their former services, that he would now lead them back to their native country: an act, which, of all others, would most contribute to his own great designs; since it would encourage the youth of Macedon, and even of all Greece, to follow him in whatever new expedition he pleased to undertake.” The king was far from being pleased with this speech of Cœnus, and much less with the disposition of his army, which continued in a deep silence. He therefore dismissed the assembly: but next day he called another, wherein he told the soldiers plainly, that he would not be driven from his purpose; that he would proceed in his conquests with such as should follow him voluntarily: as for the rest, he would not detain them, but would leave them at liberty to go home to Macedon, where they might publish, “that they had left their king in the midst of his enemies.” Even this expedient had no success; his army was so thoroughly tired with long marches and desperate battles, that they were determined to go no further, either for fair speeches or foul. Upon this Alexander retired to his tent, where he refused to see his friends, and put on the same gloomy temper that reigned among his troops. For three days, things remained in this situation. At last the king suddenly appeared; and, as if he had been fully determined to pursue his first design, he gave orders for sacrificing for the good success of his new undertaking. Aristander the augur reported, that the omens were altogether inauspicious; upon which the king said, that since his proceeding farther was neither pleasing to the gods, nor grateful to his army, he would return. When this was rumoured among the army, they assembled

61  
Sails down  
the Indus.

A stop being thus put to the conquests of Alexander, he determined to make the Hyphasis the boundary of his dominions; and having erected twelve altars of an extraordinary magnitude, he sacrificed on them: after which he exhibited shows in the Grecian manner; and, having added all the conquered country in these parts to the dominions of Porus, he began to return. Having arrived at the Hydaspes, he made the necessary preparations for sailing down the Indus into the ocean. For this purpose, he ordered vast quantities of timber to be felled in the neighbourhood of the Hydaspes, through which he was to sail into the Indus; he caused the vessels with which he had passed other rivers to be brought thither, and assembled a vast number of artificers capable of repairing and equipping his fleet; which, when finished, consisted of 80 vessels of three banks of oars, and 2000 lesser ships and transports. Those who were to manage this fleet were collected out from the Phœnicians, Cyprians, Carians, and Egyptians following his army, and who were reckoned perfectly well skilled in the naval art. When all things were ready, the army embarked about break of day; the king, in the mean time, sacrificing to the gods according to the ceremonies used in his own country, and likewise according to those of the country where he now was. Then he himself went on board; and causing the signal to be given by sound of trumpet, the fleet set sail. Craterus and Hephaestion had marched some days before with another division of the army; and in three days the fleet reached that part of the river which was opposite to their camps. Here he had information, that the Oxydrææ and Malli were raising forces to oppose him: upon which he immediately determined to reduce them; for, during this voyage, he made it a rule to compel the inhabitants on both sides of the river to yield him obedience. But before he arrived on the coasts of the people abovementioned, he himself sustained no small danger; for, coming to the confluence of the Acesines with the Hydaspes, from whence both rivers roll together into the Indus, the eddies, whirlpools, and rapid currents, rushing with tremendous noise from the respective channels of those rivers into the great one formed by them both, at once terrified those who navigated his vessels, and actually destroyed many of the long vessels, with all who were aboard of them; the king himself being in some danger, and Nearchus the admiral not a little at a loss. As soon as this danger was over, Alexander went on shore; and having ordered his elephants with some troops of horse and archers to be carried across, and put under the command of Craterus, he then divided his army on the left-hand bank into three bodies; the first commanded by himself, the second by Hephaestion, and the third by Ptolemy. Hephaestion had orders to move silently through the heart of the country, five days march before the king; that if, on Alexander's approach, any of the barbarians should attempt to shelter themselves by retiring into the

country, they might fall into the hands of Hephaestion. Ptolemy Lagus was ordered to march three days journey behind the king, that if any escaped his army, they might fall into Ptolemy's hands; and the fleet had orders to stop at the confluence of this river with the Hydrates, till such time as these several corps should arrive.

Alexander himself, at the head of a body of horse and light-armed foot, marched through a desertion country against the Malli; and, scarce affording any rest to his soldiers, arrived in three days at a city into which the barbarians had put their wives and children, with a good garrison for their defence. The country people, having no notion that Alexander would march through such a desert and barren region, were all unarmed, and in the utmost confusion. Many of them therefore were slain in the field; the rest fled into the city, and shut the gates. But this only protracted their fate for a short time; for the king, having ordered the city to be invested by his cavalry, took it, as well as the castle, by storm, and put all he found there to the sword. He sent at the same time Perdiccas with a considerable detachment, to invest another city of the Malli at a considerable distance; but when he came there, he found it abandoned. However, he pursued the inhabitants who had but lately left it, and killed great numbers of them on the road. After this the king took several other cities, but not without considerable resistance; for the Indians sometimes chose to burn themselves in their houses rather than surrender. At last he marched to their capital city; and finding that abandoned, he proceeded to the river Hydrates, where he found 50,000 men encamped on the opposite bank, in order to dispute his passage. He did not hesitate, however, to enter the river with a considerable party of horse, and so much were the Indians terrified at his presence, that their whole army retired before him. In a short time they returned and attacked him, being ashamed to fly before such an inconsiderable number; but in the mean time the rest of the Macedonian forces came up, and the Indians were obliged to retire to a city which lay behind them, and which Alexander invested that very night. The next day he stormed the city with such violence, that the inhabitants were compelled to abandon it, and to retire to the castle, where they prepared for an obstinate defence. The king instantly gave orders for scaling the walls, and the soldiers prepared to execute these orders as fast as they could; but the king being impatient, caught hold of a ladder and mounted it first himself, being followed by Leonatus, Peucestas, and Abreas, the latter a man of great valour, and who on that account had double pay allowed him. The king having gained the top of the battlements, cleared them quickly of the defenders, killing some of them with his sword, and pushing others over the walls: but after this was done, he was in more danger than ever; for the Indians galled him with their arrows from the adjacent towers, though they durst not come near enough to engage him. His own battalion of targeteers mounting in haste to second him, broke the ladders; which, as soon as Alexander perceived, he threw himself down into the castle, as did also Peucestas, Leonatus, and Abreas. As soon as the king was on the ground, the

and danger.

Macedon.

the Indian general rushed forward to attack him; but Alexander instantly dispatched him, as well as several others who followed him. Upon this the rest retired, and contented themselves with throwing darts and stones at him at a distance. Abreas was struck into the head with an arrow, and died on the spot; and, shortly after, another pierced through the king's breast-plate into his body. As long as he had spirits, he defended himself valiantly; but, through a vast effusion of blood, losing his senses, he fell upon his shield. Peucestas then covered him with the sacred shield of Pallas on one side, as did Leonatus with his own shield on the other, though they themselves were dreadfully wounded. In the mean time, however, the soldiers on the outside, eager to save their king, supplied their want of ladders by driving large iron pins into the walls. By the help of these many of them ascended, and came to the assistance of Alexander and his companions. The Indians were now slaughtered without mercy; but Alexander continued for some time in a very dangerous way: however, he at last recovered his strength, and shewed himself again to his army, which filled them with the greatest joy.

64  
Is with difficulty saved by his men.

65  
He proceeds in his voyage down the Indus.

The Malli, being now convinced that nothing but submission could save the remainder of them, sent deputies to Alexander, offering him the dominion of their country; as did also the Oxydræ: and the king having settled every thing in these countries agreeable to his mind, proceeded on his voyage down the river Indus. In this voyage he received the submission of some other Indian princes; and perceiving, that, at the point of island Pattala, the river divided itself into two vast branches, he ordered an haven and convenient docks to be made there for his ships; and when he had careened his fleet, he failed down the right-hand branch towards the ocean. In his passage he sustained great difficulties by reason of his want of pilots, and at the mouth of the river very narrowly missed being cast away: yet all this did not hinder him from pursuing his first design, though it does not appear that he had any other motive thereto than the vain desire of boasting that he had entered the ocean beyond the Indus: for, having consecrated certain bulls to Neptune, and thrown them into the sea, performed certain libations of golden cups, and thrown the cups also into the sea, he came back again; having only surveyed two little islands, one at the mouth of the Indus, and one a little farther in the ocean.

On the king's return to Pattala, he resolved to sail down the other branch of the Indus, that he might see whether it was more safe and commodious for his fleet than that which he had already tried; and for this he had very good reasons. He had resolved to send Nearchus with his fleet by sea, through the Persian gulf up the river Tygris, to meet him and his army in Mesopotamia; but as the possibility of this voyage depended on the ceasing of the Etesian winds, there was a necessity of laying up the fleet till the season should prove favourable. Alexander, therefore, sailing through this branch of the Indus, fought on the sea-coast for bays and creeks, where his fleet might anchor in safety; he caused also pits to be sunk, which might be filled with fresh water for the use of his people; and took all imaginable precautions

for preserving them in ease and safety till the season would allow them to continue their voyage. In this he succeeded to his wish; for he found this branch of the river Indus, at its mouth, spread over the plain country and forming a kind of lake, wherein a fleet might ride with safety. He therefore appointed Leonatus, and a part of his army, to carry on such works as were necessary; causing them to be relieved by fresh troops as often as there was occasion: then having given his last instructions to Nearchus, he departed with the rest of the army, in order to march back to Babylon.

66  
Sets out for Babylon.

Before the king's departure, many of his friends advised him against the route which he intended to take. They told him, that nothing could be more rash or dangerous than this resolution. They acquainted him, that the country, thro' which he was to travel, was a wild uncultivated desert; that Semiramis, when she led her soldiers this way out of India, brought home but 20 of them; and that Cyrus, attempting to do the same, returned with only seven. But all this was so far from deterring Alexander, that it more than ever determined him to pursue no other road. As soon, therefore, as he had put things in order, he marched at the head of a sufficient body of troops to reduce the Oritæ, who had never vouchsafed either to make their submission or to court his friendship. Their territories lay on the other side of a river called *Arabis*, which Alexander crossed so speedily, that they had no intelligence of his march; whereupon most of them quitted their country, and fled into the deserts. Their capital he found so well situated, that he resolved to take it out of their hands, and to cause a new and noble city to be founded there, the care of which he committed to Hephæstion. Then he received the deputies of the Oritæ and Gedrosi; and having assured them, that if the people returned to their villages, they should be kindly treated, and having appointed Apollphanes president of the Oritæ, and left a considerable body of troops under Leonatus to secure their obedience, he began his march thro' Gedrosia. In this march his troops suffered incredible hardships. His march road was very uncertain and troublesome, on account of its lying thro' deep and loose sands, rising in many places into hillocks, which forced the soldiers to climb, at the same time that it sunk under their feet; there were no towns, villages, nor places of refreshment, to be met with; so that, after excessive marches, they were forced to encamp among these dry sands. As to provisions, they hardly met with any during their whole march. The soldiers were therefore obliged to kill their beasts of carriage: and such as were sent to bring some corn from the sea-side, were so grievously distressed, that, tho' it was sealed with the king's signet, they cut open the bags; choosing rather to die a violent death for disobedience, than perish by hunger. When the king, however, was informed of this, he freely pardoned the offenders; he was also forced to accept the excuses that were daily made for the loss of mules, horses, &c. which were in truth eaten by the soldiers, and their carriages broken in pieces to avoid further trouble. As for water, their want of it was a great misfortune; and yet their finding it in plenty was sometimes a greater: for, as by the first they perished with thirst, so by the latter they were burst,

throwa

thrown into droppies, and rendered incapable of travel. Frequently they met with no water for the whole day together: sometimes they were disappointed of it at night; in which case, if they were able, they marched on; so that it was common with them to travel 30, 40, 50, or even 60 miles without encamping. Numbers thro' these hardships were obliged to lag in the rear; and of these many were left behind, and perished; for indeed scarce any ever joined the army again. Their miseries, however, they sustained with incredible patience, being encouraged by the example of their king; who, on this occasion, suffered greater hardships than the meanest soldier in his army. At last they arrived at the capital of Gedrosia, where they refreshed themselves, and said some time: after which, they marched into Caramania; which being a very plentiful country, they there made themselves ample amends for the hardships and fatigues they had sustained. Here they were joined first by Craterus with the troops under his command, and a number of elephants; then came Stasaur president of the Arians, and Pharfmanes the son of Phrataphernes governor of Parthia. They brought with them camels, horses, and other beasts of burden, in vast numbers; having foreseen, that the king's march thro' Gedrosia would be attended with the loss of the greatest part, if not of all the cavalry and beasts belonging to his army.

During Alexander's stay in Caramania, he redressed the injuries of his people, who had been grievously oppressed by their governors during his absence. Here also he was joined by his admiral Nearchus, who brought him an account that all under his command were in perfect safety, and in excellent condition; with which the king was mightily pleased, and, after having bestowed on him singular marks of his favour, sent him back to the navy. Alexander next set out for Persia, where great disorders had been committed during his absence. These also he redressed, and caused the governor to be crucified; appointing in his room Peucestas, who saved his life when he fought singly against a whole garrison as above related. The new governor was no sooner invested with his dignity, than he laid aside the Macedonian garb, and put on that of the Medes; being the only one of Alexander's captains, who, by complying with the manners of the people he governed, gained their affection.

While Alexander visited the different parts of Persia, he took a view, among the rest, of the ruins of Persepolis, where he is said to have expressed great sorrow for the destruction he had formerly occasioned. From Persepolis he marched to Susa, where he gave an extraordinary loose to pleasure; resolving to make himself and his followers some amends for the difficulties they had hitherto undergone; purposing at the same time so effectually to unite his new-conquered with his hereditary subjects, that the jealousies and fears, which had hitherto tormented both, should no longer subsist. With this view he married two wives of the blood-royal of Persia; viz. Barsine, or Statira, the daughter of Darius, and Parysatis the daughter of Ochus. Drypetis, another daughter of Darius, he gave to Hephæstion; Amastriene, the daughter of Oxyartes the brother of Darius, married Craterus; and to the rest of his friends, to the number of 80, he gave other women of the greatest quality. All these mar-

riages were celebrated at once, Alexander himself bestowing fortunes upon them: he directed likewise to take account of the number of his officers and soldiers who had married Asiatic wives; and tho' they appeared to be 10,000, yet he gratified each of them according to his rank. He next resolved to pay the debts of his army, and thereupon issued an edict directing every man to register his name and the sum he owed; with which the soldiers complying slowly, from an apprehension that there was some design against them, Alexander ordered tables heaped with money to be set in all quarters of the camp, and caused every man's debts to be paid on his bare word, without even making any entry of his name; tho' the whole sum came to 20,000 talents. On such as had distinguished themselves in an extraordinary manner, he bestowed crowns of gold. Peucestas had the first; Leonatus the second; Nearchus the third; Onesicritus the fourth; Hephæstion the fifth; and the rest of his guards had each of them one. After this he made other dispositions for conciliating, as he supposed, the differences among all his subjects. He reviewed the 30,000 youths, whom at his departure for India he had ordered to be taught Greek, and the Macedonian discipline; expressing high satisfaction at the fine appearance they made, which rendered them worthy of the appellation he bestowed on them, viz. that of *Epigoni*, i. e. successors. He promoted also, without any distinction of nation, all those who had served him faithfully and valiantly in the Indian war. When all these regulations were made, he gave the command of his heavy-armed troops to Hephæstion, and ordered him to march directly to the banks of the Tigris, while in the mean time a fleet was equipped for carrying the king and the troops he retained with him down to the ocean.

Thus ended the exploits of Alexander; the greatest conqueror that ever the world saw, at least with respect to the rapidity of his conquests. In 12 years time he had brought under his subjection Egypt, Libya, Asia Minor, Syria, Phœnicia, Palestine, Babylonia, Persia, with part of India and Tartary. Still, however, he meditated greater things. He had now got a great taste in maritime affairs; and is said to have meditated a voyage to the coasts of Arabia and Ethiopia, and thence round the whole continent of Africa to the Straits of Gibraltar. But of this there is no great certainty; though that he intended to subdue the Carthaginians and Italians, is more than probable. All these designs, however, were frustrated by his death, which happened at Babylon in 323 B. C. He is said to have received several warnings of his approaching fate, and to have been advised to avoid that city; which advice he either despised or could not follow. He died of a fever after eight days illness, without naming any successor; having only given his ring to Perdicas, and left the kingdom, as he said, to the most worthy.

With the death of Alexander fell also the glory of the Macedonians; who very soon relapsed into a situation as bad, or worse than that in which they had been before the reign of Philip. This was occasioned principally by his not having distinctly named a successor; and having no child of his own come to the years of discretion, to whom the kingdom might seem

naturally to belong. The ambition and jealousy of his mother Olympias, his queen Roxana, and especially of the great commanders of his army, not only prevented a successor from being ever named, but occasioned the death of every person, whether male or female, who was in the least related to Alexander. To have a just notion of the origin of these disturbances, it is necessary in the first place to understand the situation of the Macedonian affairs at the time of Alexander's death.

When Alexander set out for Asia, he left Antipater, as we formerly observed, in Macedon, to prevent any disturbances that might arise either there or in Greece. The Greeks, even during the lifetime of Alexander, bore the superiority which he exercised over them with great impatience; and, though nothing could be more gentle than the government of Antipater, yet he was exceedingly hated, because he obliged them to be quiet. One of the last actions of Alexander's life left all Greece in a flame. He had, by an edict, directed all the cities of Greece to recall their exiles; which edict, when it was published at the Olympic games, created much confusion. Many of the cities were afraid, that, when the exiles returned, they would change the government; most of them doubted their own safety if the edict took place; and all of them held this peremptory decree to be a total abolition of their liberty. No sooner therefore did the news of Alexander's death arrive, than they prepared for war.

In Asia the state of things was not much better; not indeed through any inclination of the conquered countries to revolt, but through the dissensions among the commanders.—In the general council which was called soon after the death of Alexander, after much confusion and altercation, it was at last agreed, or rather commanded by the soldiers, that Aridæus the brother of Alexander, who had always accompanied the king, and had been wont to sacrifice with him, should assume the sovereignty.—This Aridæus was a man of very slender parts and judgment, not naturally, but by the wicked practices of Olympias, who had given him poisonous draughts in his infancy, left he should stand in the way of her son Alexander, or any of his family; and for this, or some other reason, Perdiccas, Ptolemy, and most of the horse-officers, resented his promotion to such a degree, that they quitted the assembly, and even the city. However, Meleager, at the head of the phalanx, vigorously supported their first resolution, and threatened loudly to shed the blood of those who affected to rule over their equals, and to assume a kingdom which no way belonged to them. Aridæus was accordingly arrayed in royal robes, had the arms of Alexander put upon him, and was saluted by the name of *Philip*, to render him more popular. Thus were two parties formed, at the head of whom were Meleager and Perdiccas; both of them pretending val concern for the public good, yet, at bottom, desiring nothing more than their own advantage. Perdiccas was a man of high birth, had had a supreme command in the army, was much in favour with Alexander, and one in whom the nobility had put great confidence. Meleager was become formidable by having the phalanx on his side, and having the nominal king entirely in his power: for Aridæus, or Philip,

was obliged to comply with whatever he thought proper, and publicly declared, that whatever he did was by the advice of Meleager; so that he made his minister accountable for his own schemes, and no way endangered himself. The Macedonians also, besides their regard for the deceased king, soon began to entertain a personal love for Philip, on account of his moderation.

It is remarkable, however, that notwithstanding all the favours which Alexander had conferred upon his officers, and the fidelity with which they had served him during his life, only two of them were attached to the interests of his family after his death. These were Antipater, and Eumenes the Cardian, whom he had appointed his secretary. Antipater, as we have already seen, was embroiled with the Greeks, and could not assist the royal family who were in Asia; and Eumenes had not as yet sufficient interest to form a party in their favour. In a short time, however, Perdiccas prevailed against Meleager, and got him murdered; by which means the supreme power for a time fell into his hands. His first step, in consequence of this power, was to distribute the provinces of the empire among the commanders in the following manner, in order to prevent competitors, and to satisfy the ambition of the principal commanders of the army. Aridæus, and the son of Roxana, born after the death of his father, were to enjoy the regal authority. Antipater had the government of the European provinces. Craterus had the title of *protector*. Perdiccas was general of the household troops in the room of Hephestion. Ptolemy the son of Lagos had Egypt, Libya, and that part of Arabia which borders upon Egypt. Cleomenes, a man of infamous character, whom Alexander had made receiver-general in Egypt, was made Ptolemy's deputy. Leoncom had Syria; Philotas, Cilicia; Pithon, Media; Eumenes, Cappadocia, Paphlagonia, and all the country bordering on the Euxine Sea, as far as Trapezus; but these were not yet conquered, so that he was a governor without a province. Antigonus had Pamphylia, Lycia, and Phrygia Major; Cassander, Caria; Menander, Lydia; Leonatus, Phrygia on the Hellespont.

In the mean time, not only Alexander's will, but Alexander himself, was so much neglected, that his body was allowed to remain seven days before any notice was taken of it, or any orders given for its being embalmed. The only will he left was a short memorandum of six things he would have done.—1. The building of a fleet of 1000 stout galleys, to be made use of against the Carthaginians and other nations, who should oppose the reduction of the sea-coasts of Africa and Spain, with all the adjacent islands, as far as Sicily. 2. A large and regular highway was to be made along the coast of Africa, as far as Ceuta and Tangier. 3. Six temples of extraordinary magnificence were to be erected at the expence of 1500 talents each. 4. Castles, arsenals, havens, and yards, for building ships, to be settled in proper places throughout his empire. 5. Several new cities were to be built in Europe and Asia; those in Asia to be inhabited by colonies from Europe, and those in Europe to be filled with Asiatics; that, by blending their people and their manners, that hereditary antipathy might be eradicated which had hitherto subsisted

substituted between the inhabitants of the different continents. 6. Lastly, he had projected the building of a pyramid, equal in bulk and beauty to the biggest in Egypt, in honour of his father Philip. All these designs, under pretence of their being expensive, were referred to a council of Macedonians, to be held nobody knew when, or where.

The government, being now in the hands of Perdiccas and Roxana, grew quickly very cruel and distasteful. Alexander was scarce dead when the queen sent for Statira and Drypetis, the two daughters of Darius, one of whom had been married to Alexander, and the other to Hephæstion; but as soon as they arrived at Babylon, caused them both to be murdered, that no son of Alexander by any other woman, or of Hephæstion, might give any trouble to her or her son Alexander. Sygambis, the mother of Darius, no sooner heard that Alexander the Great was dead, than she laid violent hands on herself, being apprehensive of the calamities which were about to ensue.

78

69  
The Greeks revolt, but are subdued.

War was first declared in Greece against Antipater in the year 321 B. C. Through the treachery of the Thessalians, that general was defeated, with the army he had under his own command. Leonatus was therefore sent from Asia, with a very considerable army, to his assistance; but both were overthrown with great loss by the confederates, and Leonatus himself was killed. In a short time, however, Craterus arrived in Greece with a great army, the command of which he resigned to Antipater. The army of the confederates amounted to 25,000 foot, and 3000 horse; but Antipater commanded no fewer than 40,000 foot, 3000 archers, and 5000 horse. In such an unequal contest, therefore, the Greeks were defeated, and forced to sue for peace; which they did not obtain but on condition of their receiving Macedonian garrisons into several of their cities. At Athens also the democratic government was abrogated; and such a dreadful punishment did this seem to the Athenians, that 22,000 of them left their country, and retired into Macedon.

80  
Disturbances in Asia and Thrace.

While these things were doing in Greece, disturbances began also to arise in Asia and in Thrace. The Greek mercenaries, who were dispersed through the inland provinces of Asia, despairing of ever being allowed to return home by fair means, determined to attempt it by force. For this purpose, they assembled to the number of 20,000 foot, and 3000 horse; but were all cut off to a man by the Macedonians. In Thrace, Lydimachus was attacked by one Seuthes, a prince of that country who claimed the dominions of his ancestors, and had raised an army of 20,000 foot and 8000 horse. But though the Macedonian commander was forced to engage this army with no more than 4000 foot and 2000 horse, yet he kept the field of battle, and could not be driven out of the country. Perdiccas, in the mean time, by pretending friendship to the royal family, had gained over Eumenes entirely to his interest; and at last put him in possession of the province of Cappadocia by the defeat of Ariarathes king of that country, whom he afterwards cruelly caused to be crucified. His ambition, however, now began to lead him into difficulties. At the first division of the provinces, Perdiccas, to strengthen his own

81  
Ambition and cruelty of Perdiccas.

authority, had proposed to marry Nicæa the daughter of Antipater; and so well was this proposal resisted, that her brethren Jollas and Archias conducted her to him, in order to be present at the celebration of the nuptials. But Perdiccas now had other things in view. He had been solicited by Olympias to marry her daughter Cleopatra, the widow of Alexander king of Epirus, and who then resided at Sardis in Lydia. Eumenes promoted this match to the utmost of his power, because he thought it would be for the interest of the royal family; and his persuasions had such an effect on Perdiccas, that he was sent to Sardis to compliment Cleopatra, and to carry presents to her in name of her new lover. In the absence of Eumenes, however, Alcetas, the brother of Perdiccas, persuaded him to marry Nicæa; but, in order to gratify his ambition, he resolved to divorce her immediately after marriage, and marry Cleopatra. By this last marriage, he hoped to have a pretence for altering the government of Macedon; and, as a necessary measure preparative to these, he entered into contrivances for destroying Antigonus. Unfortunately for himself, however, he ruined all his schemes by his own jealousy and precipitate cruelty. Cynane, the daughter of Philip by his second wife, had brought her daughter named *Adda*, and who was afterwards named *Eurydice*, to court, in hopes that king Aridæus might marry her. Against Cynane, Perdiccas, on some political motives, conceived such a grudge, that he caused her to be murdered. This raised a commotion in the army: which frightened Perdiccas to such a degree, that he now promoted the match between Aridæus and Eurydice; to prevent which, he had murdered the mother of the young prince. But, in the mean time, Antigonus, knowing the designs of Perdiccas against himself, fled with his son Demetrius to Greece, there to take shelter under the protection of Antipater and Craterus, whom he informed of the ambition and cruelty of the regent.

82  
A combination against him.

A civil war was now kindled. Antipater, Craterus, Neoptolemus, and Antigonus, were combined against Perdiccas; and it was the misfortune of the empire in general, that Eumenes, the most able general, as well as the most virtuous of all the commanders, was on the side of Perdiccas, because he believed him to be in the interest of Alexander's family. Ptolemy, in the mean time, remained in quiet possession of Egypt; but without the least intention of owning any person for his superior: however, he also acceded to the league formed against Perdiccas; and thus the only person in the whole empire who consulted the interest of the royal family was Eumenes.

83  
Alexander buried in Egypt.

It was now thought proper to bury the body of Alexander, which had been kept for two years, during buried in all which time preparations had been making for it. Aridæus, to whose care it was committed, set out from Babylon for Damascus, in order to carry the king's body to Egypt. This was fore against the will of Perdiccas; for it seems there was a superstitious report, that wherever the body of Alexander was laid, that country should flourish most. Perdiccas, therefore, out of regard to his native soil, would have it conveyed to the royal sepulchres in Macedon; but Aridæus, pleading the late king's express direction, was determined to carry it to Egypt, from thence

Macedon. to be conveyed to the temple of Jupiter Ammon. Macedon.

—The funeral was accordingly conducted with all imaginable magnificence. Ptolemy came to meet the body as far as Syria: but, instead of burying it in the temple of Jupiter Ammon, erected a stately temple for it in the city of Alexandria; and, by the respect he shewed for his dead master, induced many of the Macedonian veterans to join him, and who were afterwards of the greatest service to him.

84  
Perdiccas  
killed by  
his own  
men.  
No sooner was the funeral over, than both the parties above mentioned fell to blows. Perdiccas marched against Ptolemy; but was slain by his own men, who, after the death of their general, submitted to his antagonist; and thus Eumenes was left alone to contend against all the other generals who had served under Alexander. In this contest, however, he would by no means have been overmatched, had his soldiers been attached to him; but as they had been accustomed to serve under those very generals against whom they were now to fight, they were on all occasions ready to betray and desert Eumenes. However, he defeated and killed Neoptolemus and Craterus, but then found himself obliged to contend with Antipater and Antigonus. Antipater was now appointed protector of the kings, with sovereign power; and Eumenes was declared a public enemy. A new division

85  
A new di-  
vision of  
the empire  
of Alexander's empire took place. Egypt, Libya, and the parts adjacent, were given to Ptolemy because they could not be taken from him. Syria was confirmed to Leomedon. Philoxenus had Cilicia, Mesopotamia and Arbelitis were given to Amphimachus. Babylon was bestowed on Seleucus. Susiana fell to Antigonus, who commanded the Macedonian *Argyraspide* or *Silver Shields*, because he was the first who opposed Perdiccas. Peucestas held Persia. Tlepolemus had Caramania. Pithon had Media as far as the Caspian straits. Stasander had Aria and Drangia. Philip, Parthia. Stasenor, Bactria and Sogdia. Sybirtius, Aracopia. Oxyartes, the father of Roxana, Parapomis. Another Pithon had the country between this province and India. Porus and Taxiles held what Alexander had given them, because they would not part with any of their dominions. Cappadocia was assigned to Nicanor. Phrygia Major, Lycaonia, Pamphylia, and Lycia, were given to Antigonus. Caria to Cassander, Lydia to Clytus, Phrygia the Less to Arideus, Cassander was appointed general of the horse; while the command of the household troops was given to Antigonus, with orders to prosecute the war against Eumenes.—Antipater having thus settled every thing as well as he could, returned to Macedon with the two kings, to the great joy of his countrymen, having left his son Cassander to be a check upon Antigonus in Asia.

Matters now seemed to wear a better aspect than they had yet done; and, had Eumenes believed that his enemies really consulted the interest of Alexander's family, there is not the least doubt that the war would have been immediately terminated. He saw, however, that the design of Antigonus was only to set up for himself, and therefore he refused to submit. From this time, therefore, the Macedonian empire ceased in Asia; and an account of the transactions of this part of the world fall to be recorded under the article SYRIA. The Macedonian affairs are now en-

tirely confined to the kingdom of Macedon itself, and to Greece.

Antipater had not long been returned to Macedon, when he died; and the last action of his life completed the ruin of Alexander's family. 86  
Total de-  
struction of  
Alexander's fa-  
mily. Out of a view to the public good, he had appointed Polyperchon, the eldest of Alexander's captains at hand, to be *protector* and *governor* of Macedon. This failed not to disgust his son Cassander; who thought he had a natural right to these offices, and of course kindled a new civil war in Macedon. This was indeed highly promoted by his first actions as a governor. He began with attempting to remove all the governors appointed in Greece by Antipater, and to restore democracy wherever it had been abolished. The immediate consequence of this was, that the people refused to obey their magistrates; the governors refused to resign their places, and applied for assistance to Cassander. Polyperchon also had the imprudence to recall Olympias from Epirus, and allow her a share in the administration; which Antipater, and even Alexander himself, had always refused her. The consequence of all this was, that Cassander invaded Greece, where he prevailed against Polyperchon; Olympias returned to Macedon, where she cruelly murdered Arideus and his wife Eurydice; she herself was put to death by Cassander, who afterwards caused Roxana and her son to be murdered; and Polyperchon being driven into Etolia, first raised to the crown Hercules the son of Alexander by the daughter of Darius, and then by the instigation of Cassander murdered him, by which means the line of Alexander the Great became totally extinct.

87  
Various re-  
volutions  
in the go-  
vernment.  
Cassander having thus destroyed all the royal family, assumed the regal title, as he had for 16 years before had all the power. He enjoyed the title of *king of Macedon* only three years; after which he died, about 298 B.C. By Thessalonica, the daughter of Philip king of Macedon, he left three sons, Philip, Antipater, and Alexander. Philip succeeded him, but soon after died of a consumption. A contest immediately began between the two brothers, Antipater and Alexander. Antipater seized the kingdom; and to secure himself in it, murdered his mother Thessalonica, if not with his own hand, at least the execrable fact was committed in his presence. Alexander invited Pyrrhus king of Epirus, and Demetrius the son of Antigonus, to assist him and revenge the death of his mother. But Pyrrhus being bought off, and a peace concluded between the brothers, Alexander, being afraid of having too many protectors, formed a scheme of getting Demetrius assassinated. Instead of this, however, both he and Antipater were put to death; and Demetrius became king of Macedon four years after the death of Cassander.

In 287 B.C. Demetrius was driven out by Pyrrhus, who was again driven out by Lyfimachus two years after, who was soon after killed by Seleucus Nicator; and Seleucus, in his turn, was murdered by Ptolemy Ceraunus, who became king of Macedon about 280 B.C. The new king was in a short time cut off, with his whole army, by the Gauls; and Antigonus Gonatus, the son of Demetrius Poliorcetes, became king of Macedon in 278 B.C. He proved successful against the Gauls, but was driven out by Pyrrhus king of Epirus; who, however, soon dislodged his subjects to such a degree,

Macedon. degree, that Antigonus recovered a great part of his kingdom. But in a little time, Pyrrhus being killed at the siege of Argos in Greece, Antigonus was restored to the whole of Macedonia; but scarcely was he seated on the throne, when he was driven from it by Alexander the son of Pyrrhus. This new invader was, in his turn, expelled by Demetrius the son of Antigonus; who, though at that time but a boy, had almost made himself master of Epirus. In this enterprise, however, he was disappointed; but by his means Antigonus was restored to his kingdom, which he governed for many years in peace. By a stratagem he made himself master of the city of Corinth, and from that time began to form schemes for the thorough conquest of Greece. The method he took to accomplish this was, to support the petty tyrants of Greece against the free states: which indeed weakened the power of the latter; but involved the whole country in so many calamities, that these transactions could not redound much to the reputation either of his arms or his honour. About 243 B. C. he died, leaving the kingdom to his son, Demetrius II.

25  
With  
the Ro-  
mans.

Neither Demetrius, nor his successor Antigonus Dofon, performed any thing remarkable. In 221 B. C. the kingdom fell to Philip, the last but one of the Macedonian monarchs. To him Hannibal applied for assistance after the battle of Cannæ, which he refused; and the same imprudence which made him refuse this assistance prompted him to embroil himself with the Romans; and at last to conclude a treaty with them, by which he in effect became their subject, being tied up from making peace or war but according to their pleasure. In 179 B. C. he was succeeded by his eldest son Perfes, under whom the war with the Romans was renewed. Even yet the Macedonians were terrible in war; and their phalanx, when properly conducted, seems to have been absolutely invincible by any method of making war known at that time. It consisted of 16,000 men, of whom 1000 marched abreast, and thus was 16 men deep, each of whom carried a kind of pike 23 feet long. The soldiers stood so close, that the pikes of the fifth rank reached their points beyond the front of the battle. The hindermost ranks leaned their pikes on the shoulders of those who went before them, and, locking them fast, pressed briskly against them when they made the charge; so that the first five ranks had the impetus of the whole phalanx, which was the reason why the shock was generally irresistible. The Romans had never encountered such a terrible enemy; and in the first battle, which happened 171 B. C. they were defeated with the loss of 2200 men, while the Macedonians lost no more than 60. The generals of Perfes now pressed him to storm the enemy's camp; but he being naturally of a cowardly disposition refused to comply, and thus the best opportunity he ever had was lost. Still, however, the Romans gained little or no advantage, till the year 168 B. C. when Paulus Æmilius, a most experienced commander, was sent into Macedonia. Perfes now put all upon the issue of a general engagement; and Æmilius, with all his courage and military experience, would have been defeated, had the Macedonians been commanded by a general of the smallest courage or conduct. The light-armed Macedonians charged with such vigour, that, after the battle, some of their bodies were found with-

in two furlongs of the Roman camp. When the phalanx came to charge, the points of their spears striking into the Roman shields, kept the heavy-armed troops from making any motion; while, on the other hand, Perfes's light-armed men did terrible execution. On this occasion, it is said, that Æmilius tore his clothes, and gave up all hopes. However, perceiving that as the phalanx gained ground it lost its order in several places, he caused his own light-armed troops to charge in those places, whereby the Macedonians were soon put into confusion. If Perfes with his horse had on the first appearance of this charged the Romans briskly, his infantry would have been able to recover themselves; but, instead of this, he betook himself to flight, and the infantry at last did the same, but not till 20,000 of them had lost their lives.

89  
Macedonia  
becomes a  
Roman  
province.

This battle decided the fate of Macedonia, which immediately submitted to the conqueror. The cowardly king took refuge in the island of Samothrace; but was at last obliged to surrender to the Roman consul, by whom he was carried to Rome, led in triumph, and afterwards most barbarously used. Some pretenders to the throne appeared afterwards; but being unable to defend themselves against the Romans, the country was reduced to a Roman province in 148 B. C. To them it continued subject till the year 1357, when it was reduced by the Turkish sultan Bajazet, and hath remained in the hands of the Turks ever since.

MACEDONIANS, Christian heretics, in the 4th century; followers of Macedonius, bishop of Constantinople.

Macedonius was an Arian, and governed the church in a very tyrannical manner. He translated the body of the emperor Constantine from the church of the Apostles to that of Acacius the martyr; which raised great tumults, and many were killed in the fray. He was deposed by the council of Constantinople in 359.

Repentment, it was thought, at being deposed, occasioned his forming a new heresy, which consisted in denying the divinity of the Holy Ghost; for which reason his followers were likewise called *Pneumatomachi*, that is, *enemies of the Holy Ghost*. They taught that the Holy Ghost was a mere creature, but superior in excellence to the angels.

The Macedonians make extraordinary professions of austerity; which induced great numbers to embrace their doctrine. Most of the malevolent bishops subscribed to it, and the Arians in general greedily swallowed it. Maratonus, bishop of Nicomedia, a very rich man, contributed greatly by his wealth and authority to spread it far and wide; whence the Macedonians were sometimes called *Maratonians*.

Athanafius, who at that time lay concealed in the desert, was the first who wrote against this heresy, and confuted it; after which, the councils by their decrees, and the emperors by their edicts, prosecuted it with great vigour.

MACEDONIUS. See MACEDONIANS.

MACERATION, is an infusion of, or soaking ingredients in water or any other fluid, in order either to soften them, or draw out their virtues.

MACERATA, a handfome and populous town of Italy, in the territory of the church, and in the Marche of Ancona, with a bishop's see, and an university.

Machian  
Machine.

verfity. It is feated near the mountain Chiento, in E. Long. 13. 37. N. Lat. 43. 15.

MACHIAN, one of the Molucca iflands, in the Eaft Indian Ocean, about 20 miles in circumference, and the moft fertile of them all. It likewife produces the beft cloves; and is in poffeffion of the Dutch, who have three ftrong forts built on it.

MACHIAVEL (Nicholas), a famous political writer of the 16th century, was born of a diftinguifhed family at Florence. He wrote in his native language with great elegance and politeness, though he underftood very little of the Latin tongue; but he was in the fervice of Marcellus Virgilius, a learned man, who pointed out to him many of the beautiful paffages in the ancients, which Machiavel had the art of placing properly in his works. He compofed a comedy upon the ancient Greek model; in which he turned into ridicule many of the Florentine ladies, and which was fo well received, that pope Leo X. caufed it to be acted at Rome. Machiavel was fecretary, and afterwards hiftoriographer, to the republic of Florence. The houfe of Medicis procured him this laft office, together with a handfome falary, in order to pacify his relentment for his having fuffered the torture upon fufpicion of his being an accomplice in the confpiracy of the Soderini againft that houfe, when Machiavel bore his fufferings without making any confeffion. The great encomiums he beftowed upon Brutus and Cæfars, both in his converfations and writings, made him ftrongly fufpected of being concerned in another confpiracy againft cardinal Julian de Medicis, who was afterwards pope under the name of *Clement VII.* However, they carried on no proceedings againft him; but from that time he turned every thing into ridicule, and gave himfelf up to irreligion. He died in 1530, of a remedy which he had taken by way of prevention.—Of all his writings, that which has made the moft noife, and has drawn upon him the moft enemies, is a political treatife entitled the *Prince*; which has been tranflated into feveral languages, and wrote againft by many authors. The world is not agreed as to the motives of this work; fome thinking, he meant to recommend tyrannical maxims; others, that he only delineated them to excite abhorrence. Machiavel alfo wrote Reflections on Titus Livy, which are extremely curious; The Hiftory of Florence, from the year 1205 to 1494; and a quarto volume of poems and other pieces. Mr Harrington confiders him as a fuperior genius, and as the moft excellent writer on politics and government that ever appeared.

MACHINE, MACHINA, in the general, fignifies any thing that ferves to augment, or to regulate moving powers: or it is any body deftined to produce motion, fo as to fave either time or force. The word comes from the Greek μηχανή, “ machine, invention, art.” And hence, in ftrictnefs, a machine is fomething that confifts more in art and invention, than in the ftrength and folidity of the materials; and for this reafon it is that the inventors of machines are called *ingenieurs* or *engineers*.

Machines are either fimple or compound. The fimple ones are the feven mechanical powers, viz. lever, balance, pulley, axis and wheel, wedge, fcrew, and inclined plane.

From thefe the compound ones are formed by various

combinations, and ferve for different purpofes. See Machinery, MECHANICS and HYDROSTATICS; alfo the articles CENTRIFUGAL, FIRE, STEAM, FURNACE, BUR ROUGHS, RAMSDEN, &c.

MACHINERY, in epic and dramatic poetry, is when the poet introduces the ufe of machines; or brings fome fupernatural being upon the ftage, in order to folve fome difficulty, or to perform fome exploit out of the reach of human power.

The ancient dramatic poets never made ufe of machines, unlefs where there was an abfolute neceffity for fo doing; whence the precept of Horace;

*Nec Deus interfit, nifi dignus vindice nodus Inciderit.*

It is quite otherwife with epic poets, who introduce machines in every part of their poems; fo that nothing is done without the intervention of the gods. In Milton's paradife loft, by far the greater part of the actors are fupernatural perfonages: Homer and Virgil do nothing without them; and, in Voltaire's *Henriade*, the poet has made excellent ufe of St Louis.

As to the manner in which thefe machines fhould act, it is fometimes invifibly, by fimple infpirations and fuggeltions; fometimes by actually appearing under fome human form; and, laftly, by means of dreams and oracles, which partake of the other two. However, all thefe fhould be managed in fuch a manner as to keep within the bounds of probability.

MACHINLETH, a town of Montgomeryfhire in North Wales, feated on the river Doway; over which is a large ftone bridge that leads into Merionethfhire. W. Long. 3. 55. N. Lat. 52. 34.

MACKENZIE, (Sir George), an able lawyer, a polite fcholar, and a celebrated wit, was born at Dundee in the county of Angus in Scotland in 1636, and ftudied at the univerfities of Aberdeen and St Andrews; after which he applied himfelf to the civil law, travelled into France, and profecuted his ftudy in that faculty for about three years. At his return to his native country, he became an advocate in the city of Edinburgh; and foon gained the character of an eminent pleader. He did not, however, fuffer his abilities to be confined entirely to that province. He had a good tafte for polite literature; and he gave the public, from time to time, incontestable proofs of an uncommon proficiency therein. He had prafticed but a few years, when he was promoted to the office of a judge in the criminal court; and, in 1674, was made king's advocate, and one of the lords of the privy council in Scotland. He was alfo knighted by his majesty. In thefe ftations he met with a great deal of trouble, on account of the rebellions which happened in his time; and his office of advocate requiring him to act with feverity, he did not efcape being cenfured, as if in the deaths of fome particular perfons who were executed he had ftretched the laws too far. But there does not feem to have been any juft foundation for this clamour againft him; and it is generally agreed, that he acquitted himfelf like an able and upright magiftrate. Upon the abrogation of the penal laws by king James II. our advocate, tho' he had always been remarkable for his loyalty, and even cenfured for his zeal againft traitors and fanatics, thought himfelf obliged to refign his poft; being convinced, that he could not difcharge the duties of it in that point with a good

Macarel  
||  
MacLaurin

confidence. But he was soon after restored, and held his offices till the revolution; an event which, it seems, he could not bring himself to approve. He had hoped that the prince of Orange would have returned to his own country when matters were adjusted between the king and his subjects; and upon its proving otherwise, he quitted all his employments in Scotland, and retired into England, resolving to spend the remainder of his days in the university of Oxford. He arrived there in September 1689, and professed his studies in the Bodleian library, being admitted a student there, by a grace passed in the congregation, June 2. 1690. In the spring following, he went to London; where he fell into a disorder, of which he died in May 1691. His corpse was conveyed by land to Scotland, and interred there with great pomp and solemnity.

“The politeness of his learning, and the sprightliness of his wit, were (says the reverend Mr Granger) conspicuous in all his pleadings, and shone in his ordinary conversation. Mr Dryden acknowledges, that he was unacquainted with what he calls the *beautiful turn of words and thoughts in poetry*, till they were explained and exemplified to him in a conversation with that noble wit of Scotland Sir George Mackenzie.—He wrote several pieces of history and antiquities; Institutions of the laws of Scotland; Essays upon various subjects, &c. His works were printed together at Edinburgh in 1716, in vols folio.

MACKEREL, in ichthyology. See SCOMBER.

MACKEY (John), an Englishman, employed by the government as a spy upon James II. after the revolution, was author of Memoirs of James's court at St Germaine, and of the court of England in the reigns of William III. and queen Anne; in which are many curious anecdotes not to be met with in any other work. He died in 1726.

MACLAURIN (Colin), a most eminent mathematician and philosopher, the son of a clergyman, and born at Kilmoddan in Scotland in 1668. He was sent to the university of Glasgow in 1709, and took the degree of master of arts in his 15th year; on which occasion he composed and defended a thesis on the power of gravity with great applause. In 1717, he obtained the professorship of mathematics in the Marischal college of Aberdeen against a very able competitor; and, going afterwards to London, contracted an acquaintance with Sir Isaac Newton, Dr Hoadley, Dr Clarke, Martin Folkes, esq. with other eminent men; and was admitted a member of the Royal Society. In 1722 he travelled as tutor to the eldest son of lord Polwarth; and at Lorrain wrote his piece On the percussion of bodies, which gained the prize of the Royal Academy of Sciences in 1724; but, on the death of his pupil at Montpellier, he returned immediately to Aberdeen. He was hardly settled there, when he was chosen to supply the place of Mr James Gregory, as professor at Edinburgh, where his mathematical scholars soon became very numerous. In 1745, having been very active in fortifying the city of Edinburgh against the rebel army, he was obliged to fly into the north of England; in which expedition he laid the foundation of an illness that put an end to his life in 1746. He published A complete system of fluxions, 2 vols 4to; several curious papers in the Philosophical Transactions, and in the Edinburgh Medical Essays;

and after his death appeared his Algebra, and Account of Sir Isaac Newton's philosophical discoveries. His peculiar merit as a philosopher was, that all his studies were directed to general utility, and promoting mechanical arts.

MACRIN (Salmon), one of the best Latin poets of the 16th century, was born at Loudun. His true name was *John Salmon*; but he took that of *Macrin*, from his being frequently so called in ridicule by Francis I. on account of his extraordinary leanfess. He was preceptor to Claudius of Savoy, count of Tende; and to Honorius the count's brother; and wrote several pieces of poetry in lyric verse, which were so admired, that he was called the *Horace of his time*. He died of old age, at Loudun, in 1555.—Charles Macrin, his son, was not inferior to him as a poet, and surpassed him in his knowledge of the Greek tongue. He was preceptor to Catharine of Navarre, the sister of Henry the Great; and perished in the massacre on St Bartholomew's day in 1572.

MACROBIUS (Aurelius), lived about the end of the fourth century. He was one of Theodosius's chamberlains, or one of his wardrobe. His *Saturnalia* is a pleasant mixture of criticism and antiquity. He also composed some commentaries upon that part of Cicero called *Scipio's dream*.

MACROCERCI, a name given to that class of animalcules which have tails longer than their bodies.

MACROCOSM, a word denoting the great world or universe. It is compounded of the Greek words *μακρ*, “great,” and *κοσμ*, “world.”

MACROPYRENIUM, in natural history, a genus of fossils consisting of crustated septariae, with a long nucleus standing out at each end of the mass.

MACROTELOSTYLA, in natural history, the name of a genus of crystals, which are composed of two pyramids joined to the end of a column; both the pyramids, as also the column, being hexangular, and the whole body consequently composed of 18 planes.

MACULÆ, in astronomy, dark spots appearing on the luminous surfaces of the sun and moon, and even some of the planets. See ASTRONOMY, Sect. II. and III.

MAD-APPLE. See SOLANUM.

MADAGASCAR, or ST LAURENCE, the largest of the African islands, situated between 43° and 51° of E. Long. and between 12° and 26° of S. Lat. It extends near 1000 miles from north-north-east to south-south-west, and about 300 in breadth where broadest. The whole coast is divided by rivers; and there are many bays and gulphs, with good roads and harbours. It abounds in corn, cattle, fowls, and all manner of animals and vegetables found on the continent of Africa; and affords an agreeable variety of hills, valleys, woods, and champaign. Great quantities of iron and steel are found throughout this island, which their artificers forge and purify with less difficulty and labour than Europeans. Their method is this: They reduce the ore, as brought from the mines, into powder, place it upon burning coals between four stones, which are clayed round for the purpose; and, by continual blowing underneath, with bellows made in the shape of gun-barrels or water-pumps, the ore runs in less than an hour; whence the metal being afterwards

Macin  
||  
Madagascar

Maddagair  
Madder.

wards extracted, by great heat, is formed into bars of three or four pounds weight. It is confidently affirmed, that the island has also mines of gold and silver, and of a white metal much like British tin. The rivers and brooks are rich in various kinds of precious stones, in crystals, topazes, amethysts, eagle-stones, emeralds, sapphires, hyacinths, jaspers, blood-stones, &c.

The inhabitants are of different complexions and religions; some white, some negroes; some Mohammedans, some Pagans. The whites, and those of a tawny complexion, who inhabit the coasts, are descended from the Arabs, as is evident from their language and their religious rites: but here are no mosques, temples, nor any stated worship, except that they offer sacrifices of beasts on particular occasions; as when sick, when they plant yams or rice, when they hold their assemblies, circumcise their children, declare war, enter into new built houses, and bury their dead. The country is situated under a great many petty princes, who are continually at war with one another, as upon the continent; selling their prisoners or slaves to the shipping which touch there; and taking cloathing, utensils, and other necessaries, in return. The French had once some settlements upon the island; but, at present, neither they nor any other European nation have any.

#### MADDER. See RUBIA.

Madder is a plant, the uses of which were well known to the ancients, both in respect to manufactures and physic. The Greek authors call this plant *erythrodanum*, from *erythros*, "red;" the Latins, on the same principle *rubia*; and it is styled *rubia tinctorum*, from the use made of it in dyeing. Dioscorides and Galen do not insist upon its tinging quality. But the former describes, and both explain, its medicinal virtues, as to leave no doubt as to the plant. Pliny, who commonly agrees with Dioscorides, mentions both its uses, but in different books of his history. In respect to its medical qualities, they are followed by later authors; but the nature of the colour extracted from its roots was left to such as wrote the history of the arts. With their roots they dyed wool and leather; and from these and other parts of the plant they formed a variety of medicines, to which great virtues were attributed by their ablest physicians. They had it likewise both wild and cultivated, the best sort of the latter growing, in the time of Pliny, in the neighbourhood of Rome.

As madder is a very valuable commodity, so the raising and curing it in perfection is a work of much time, trouble, and expence, for all which it pays abundantly at last. The soil best suited to this plant is a soft sandy loam, which must be properly prepared by repeated and deep ploughings, so as to render it perfectly even and fine. The young shoots for the cultivated madder is not propagated by seed, but must be planted in the course of the month of April upon ridges at three feet distance, and the plants themselves at a foot and an half distance from each other. They remain three summers in the ground; and during that space are to be carefully hoed, kept clean from weeds, and properly earthed up. They are drawn about the month of September, and must be then conveyed immediately to the drying-house,

built like those used by the tanners for their skins, except that hurdles are used in them instead of floors, that the air may have free access to the roots every way. After remaining there four or five days, and the earth perfectly cleared from them, they are carried to the cold stove, where they are farther, but very slowly, dried by the help of flues placed in the sides of the building. This being done, the madder is carried next to the floor, where it is threshed for its bark or outward rind; which, however, is swept together, barrelled up, and is what the Dutch call *mull*, which sometimes sells for eight pounds a ton, and thereby commonly detracts the expence of drying. The roots thus cleared are then conveyed to the warm stove, where the drying is gradually completed. From thence they are sent to the mill, and there ground, sorted, and packed up in casks fit for sale. In these several operations, which must all be performed with much care and exactness, the commodity loses so much of its weight, that 700 or 800 of the green will seldom make more than 100 of the dry madder. The time, trouble, and expence attending the cultivation of madder in this method have induced some, particularly the French, to endeavour to find out some expedients to shorten the process, and by ridding themselves of stoves and mills to lessen the charge. It is certainly right to examine and to consider their attempts. But, on the other hand, there is, with all its prolixity and labour, something very worthy of attention in this mode of the Dutch. The dyers use madder in different ways and for different purposes, which are all suited by the several divisions of the madder, by which all is sold, each fetches its just price, and the dyers find some or other of these sorts adapted to every intention, which is a great and apparent convenience.

The Dutch are at present possessed of an almost absolute monopoly of this valuable commodity, the cultivation of which they were taught by the Flemings; who, persecuted for their religion, long since took shelter amongst them. In times past we imported madder by the way of Hamburg from Silesia, and also from Flanders; whereas we now have it only from Holland. This that people have brought about by their unwearied industry, their careful management, and indefatigable attention. It is in a particular manner the great staple of Zealand; where, in the small ile of Schowen, they raise annually 1000 tons; for the curing of which there are about 20 stoves, each provided with a proper number of able workmen, by whom every thing is accurately and excellently performed at a settled and very moderate price, and under the most prudent and equitable regulations. When the work is finished, the madder, according to its fineness, is divided into several sorts; and, after being inspected by persons deputed by the magistrates, each sort is put up in casks with marks declaring its nature, and the arms of the town of Zirikzee painted on them, which authenticate their contents wherever they are exported. The assayers are sworn duly to respect the ordinances of Zealand, of which there are several, very explicit and well considered. The casks, besides the arms of the town, have the name of the stove, where made, and the quality of the madder, painted on them; and thus the credit and the reputation of the different parties are staked, which excites a constant attention and emulation

Madder.

Madder. ation amongst them. This plant is also cultivated not only in the other islands which compose that province, but likewise in different parts of the dominions of the United Provinces, from whence it is sent in immense quantities over all Europe.

In proportion as industry, arts, and commerce, came to prevail, and to be understood here, it was very clearly discerned that our dependance upon another nation, for an article so necessary to the progress of several manufactures, was pregnant with many inconveniences, besides the constant drain of money, not only for the benefit, but even at the will of strangers, who set what prices they pleased on what could not be wanted. In the reign of Charles I. a patent was granted to Mr Shipman the king's gardener for planting and curing of madder; which he did, and brought it to very great perfection, till, ruined by the confusion of the times, he was constrained to part with his stock, and give over the trade. We have this fact from Mr Blyth, who having been an officer in the parliament army became afterwards a great promoter of agriculture and all sorts of improvements, and is consequently a competent and unsuspected witness. He says, that Mr Shipman planted madder, and set up his works at Barn Elms, and that his commodity was highly commended by its only proper judges the dyers. It is evident therefore, that at this time we were possessed of this valuable article, which might have been found had in plenty as well as in perfection. If this opportunity had been taken, and the cultivation of madder (as it might have been) universally introduced, it would be no difficult matter to demonstrate, that this nation might have been the richer for it by some millions.

It was again attempted by Sir Nicholas Crispe, a man of extraordinary abilities, and of great public spirit, as also by persons well skilled therein at Wifbech, who, notwithstanding many obstacles that were thrown in their way, would certainly have succeeded, had not the Dutch reduced, and for a time kept the price so low, that for want of support they were constrained to give up the making of madder. This had so bad an effect, that notwithstanding the growing of this plant for physical uses and for curiosity in many private gardens, no thoughts were entertained of cultivating it to a large extent, and for the purposes of dyeing, till within these few years. It then appeared so reasonable in itself, and of such public utility, that an act of parliament was obtained to facilitate the design, which act hath been since continued, and many other marks have been given of public approbation. Stat. 31 G. II. in the preamble, the great advantages that would attend the cultivation of madder are succinctly stated; and for promoting so important a design, the tythe of every acre on which it is planted is fixed at five shillings from August 2. 1758 for 14 years. Stat. 5. Geo. III. c. 18. after reciting, that the price of the commodity hath been raised, continues the tythe at five shillings an acre for 14 years farther from the expiration of the former act. The society also for the encouraging arts, manufactures, and commerce, have promised very considerable and well considered premiums for the encouraging this very expensive improvement, as also (which may be of no small importance) for the cultivation of our own wild madder. It

may be considered therefore at present as in a state of progression; and there is very little room to doubt, that, as experience in the management of it increases, this important enterprize will move faster, till it reaches the point of perfection.

It certainly imports us, both in honour and in interest, to prosecute this improvement, now it is begun, with vigour. We have all the advantages we can reasonably wish to prompt our endeavours, as we have a great variety of soils as fit for the cultivation of this plant as any in Zealand or Flanders, and are in no danger of being confined in point of room.

The root of madder impregnates water with a dull red colour, and spirit of wine with a deep bright red. This root, when eat by animals along with their food, tinges their urine, and their most solid bones, of a deep red. Wool previously boiled in a solution of alum and tartar, receives from a hot decoction of madder and tartar a very durable but not a very beautiful red colour. Mr Margaaf (Berlin Mem. 1771), shews how a very durable lake of a fine red colour, fit for the purposes of painting, may be obtained from madder. This process is as follows: Take two ounces of the purest Roman alum, and dissolve it in three French quarts of distilled water that has boiled, and in a clean glazed pot. Set the pot on the fire; and when the water begins to boil, withdraw it, and add two ounces of the best Dutch madder. Boil the mixture once or twice; then remove it from the fire, and filter it through a double filtre of paper not coloured. Let the liquor thus filtrated stand a night to settle, and pour off the clear liquor into the glazed pot previously well cleaned. Make the liquor hot, and add to it gradually a clear solution of salt of tartar in water, till all the madder is precipitated. Filtrate the mixture; and upon the red precipitate which remains upon the filter pour boiling distilled water, till the water no longer acquires a saline taste. The red lake is then to be gently dried. No other water, neither rain nor river water, produces so good a colour as that which has been distilled, and the quantity required of this is considerable. The colour of the above precipitate is deep; but if two parts of madder be used to one part of alum, the colour will be still deeper: one part of madder and four parts of alum produces a beautiful rose colour.

MADEIRAS, a cluster of islands situated in the Atlantic ocean in W. Long. 16°, and between 32° and 33° N. Lat.—The largest of them, called *Madeira*, from which the rest take their name, is about 55 English miles long, and 10 miles broad; and was first discovered on the 2d of July, in the year 1419, by Joao Gonzaless Zarco, there being no historical foundation for the fabulous report of its discovery by one Machin an Englishman. It is divided into two capitania, named *Funchal* and *Maxico*, from the towns of those names. The former contains two judicatures, viz. *Funchal* and *Cathetta*; the latter being a town with the title of a county, belonging to the family of *Castello Melhor*. The second capitania likewise comprehends two judicatures, viz. *Maxico* (read *Ma-shico*) and *San Vicente*.

*Funchal* is the only cidade or city in this island, which has also seven villas or towns; of which there

are four, Calheta, Camara de Lobos, Ribeira braba, and Ponta de Sol in the capitania of Funchal, which is divided into 25 parishes. The other three are in the capitania of Maxico, which consist of 17 parishes; these towns are called *Maxico*, *San Vicente*, and *Santa Cruz*.

The governor is at the head of all the civil and military departments of this island, of Porto-Santo, the Salvages, and the Ilhas Defartas; which last only contain the temporary huts of some fishermen, who resort thither in pursuit of their business.

The law-department is under the corregidor, who is appointed by the king of Portugal, commonly sent from Lisbon, and holds his place during the king's pleasure. All causes come to him from inferior courts by appeal. Each judicature has a senate; and a *Juiz* or judge, whom they choose, presides over them. At Funchal he is called *Juiz da Fora*; and in the absence, or after the death of the corregidor, acts as his deputy. The foreign merchants elect their own judges, called the *Providor*, who is at the same time collector of the king's customs and revenues, which amount in all to about 12,000 l. Sterling. Far the greatest part of this sum is applied towards the salaries of civil and military officers, the pay of troops, and the maintenance of public buildings. This revenue arises, first from the tenth of all the produce of this island belonging to the king, by virtue of his office as grand master of the order of Christ; secondly, from ten per cent. duties laid on all imports, provisions excepted; and lastly, from the eleven per cent. charged on all exports.

The island has but one company of regular soldiers of 100 men: the rest of the military force is a militia consisting of 3000 men, divided into companies, each commanded by a captain, who has one lieutenant under him, and one ensign. There is no pay given to either the private men, or the officers of this militia; and yet their places are much sought after, on account of the rank which they communicate. These troops are embodied once a year, and exercised once a-month. All the military are commanded by the *Serjeante Mór*. The governor has two *Capitanes de Sal* about him, who do duty as aides-de-camp.

The secular priests on the island are about 1200, many of whom are employed as private tutors. Since the expulsion of the Jesuits, no regular public school is to be found here; unless we except a seminary, where a priest, appointed for that purpose, instructs and educates ten students at the king's expence. These wear a red cloak over the usual black gowns worn by ordinary students. All those who intend to go into orders, are obliged to qualify themselves by studying in the university of Coimbra, lately re-established in Portugal. There is also a dean and chapter at Madeira, with a bishop at their head, whose income is considerably greater than the governor's; it consists of 110 pipes of wine, and of 40 muids of wheat, each containing 24 bushels; which amounts in common years to 3000 l. Sterling. Here are likewise 60 or 70 Franciscan friars, in four monasteries, one of which is at Funchal. About 300 nuns live on the island, in four convents, of the order of Merc, Sta. Clara, Incarnacao, and Bom Jesus. Those of the last mentioned institution may marry whenever they

choose, and leave their monastery.

In the year 1768, the inhabitants living in the 43 parishes of Madeira, amounted to 63,913, of whom there were 31,341 males, and 32,572 females. But in that year 5243 persons died, and no more than 2198 children were born; so that the number of the dead exceeded that of the born by 3045. It is highly probable that some epidemical distemper carried off so disproportionate a number in that year, as the island would shortly be entirely depopulated if the mortality were always equal to this. Another circumstance concurs to strengthen this supposition, namely, the excellence of the climate. The weather is in general mild and temperate: in summer, the heat is very moderate on the higher parts of the island, whither the better sort of people retire for that season; and in the winter the snow remains there for several days, whilst it is never known to continue above a day or two in the lower parts.

The common people of this island are of a tawny colour, and well shaped; though they have large feet, owing perhaps to the efforts they are obliged to make in climbing the craggy paths of this mountainous country. Their faces are oblong, their eyes dark; their black hair naturally falls in ringlets, and begins to crisp in some individuals, which may perhaps be owing to intermarriages with negroes; in general, they are hard-featured, but not disagreeable. Their women are too frequently ill-favoured, and want the florid complexion, which, when united to a pleasing assemblage of regular features, gives our northern fair ones the superiority over all their sex. They are small, have prominent cheek-bones, large feet, an ungraceful gait, and the colour of the darkest brunette. The just proportion of the body, the fine form of their hands, and their large, lively eyes, seem in some measure to compensate for those defects. The labouring men, in summer, wear linen trowsers, a coarse shirt, a large hat, and boots; some have a short jacket made of cloth, and a long cloak, which they sometimes carry over their arm. The women wear a petticoat, and a short corselet or jacket, closely fitting their shapes, which is a simple, and often not an elegant dress. They have also a short, but wide cloak; and those that are unmarried, tie their hair on the crown of their head, on which they wear no covering.

The country-people are exceeding sober and frugal; their diet in general consisting of bread and onions, or other roots, and little animal-food. However, they avoid eating tripe, or any offals, because it is proverbially said of a very poor man, "he is reduced to eat tripe." Their common drink is water, or an infusion on the remaining rind or skin of the grape (after it has passed through the wine-press), which when fermented acquires some tartness and acidity, but cannot be kept very long. The wine for which the island is so famous, and which their own hands prepare, seldom if ever regales them.

Their principal occupation is the planting and raising of vines; but as that branch of agriculture requires little attendance during the greatest part of the year, they naturally incline to idleness. The warmth of the climate, which renders great provision against the inclemencies of weather unnecessary, and the ease with

with which the cravings of appetite are satisfied, must tend to indolence, wherever the regulations of the legislature do not counteract it, by endeavouring, with the prospect of increasing happiness, to infuse the spirit of industry. It seems the Portuguese government does not pursue the proper methods against this dangerous lethargy of the state. They have lately ordered the plantation of olive-trees here, on such spots as are too dry and barren to bear vines; but they have not thought of giving temporary assistance to the labourers, and have offered no premium by which they might be induced to conquer their reluctance to innovations and aversion to labour.

The vineyards are held only on an annual tenure, and the farmer reaps but four-tenths of the produce, since four other tenths are paid in kind to the owner of the land, one-tenth to the king, and one to the clergy. Such small profits, joined to the thought of toiling merely for the advantage of others, if improvements were attempted, entirely preclude the hopes of a future increase. Oppressed as they are, they have however preserved a high degree of cheerfulness and contentment; their labours are commonly alleviated with songs, and in the evening they assemble from different cottages to dance to the drowsy music of a guitar.

The inhabitants of the towns are more ill-favoured than the country-people, and often pale and lean. The men wear French clothes, commonly black, which do not seem to fit them, and have been in fashion in the polite world about half a century ago. Their ladies are delicate, and have agreeable features; but the characteristic jealousy of the men still locks them up, and deprives them of a happiness which the country-women, amidst all their distresses, enjoy. Many of the better people are a sort of *petite noblesse*, which we would call *gentry*, whose genealogical pride makes them unforgivable and ignorant, and causes a ridiculous affectation of gravity. The landed property is in the hands of a few ancient families, who live at Funchal, and in the various towns on the island.

Madeira consists of one large mountain, whose branches rise every where from the sea towards the centre of the isle, converging to the summit, in the midst of which is a depression or excavation, called the *Val* by the inhabitants, always covered with a fresh and delicate herbage. The slopes on the isle seem to have been in the fire, are full of holes, and of a blackish colour; in short, the greater part of them are lava. A few of them are of the kind which the Derbyshire miners call *darkstone*. The soil of the whole island is a tarras mixed with some particles of clay, lime, and sand, and has much the same appearance as some earths on the isle of Aicénson. From this circumstance, and from the excavation of the summit of the mountain, it is probable, that in some remote period, a volcano has produced the lava and the ochreous particles, and that the *Val* was formerly its crater.

Many brooks and small rivulets descend from the summits in deep chasms or glens, which separate the various parts of the isle. The beds of the brooks are in some places covered with stones of all sizes, carried down from the higher parts by the violence of winter-rains or floods of melted snow. The water is conducted by weirs and channels in the vineyards, where

each proprietor has the use of it for a certain time; some being allowed to keep a constant supply of it, some to use it thrice, others twice, and others only once a-week. As the heat of the climate renders this supply of water to the vineyards absolutely necessary, it is not without great expence that a new vineyard can be planted; for the maintenance of which, the owners must purchase water at a high price, from those who are constantly supplied, and are thus enabled to spare some of it.

Wherever a level piece of ground can be contrived in the higher hills, the natives make plantations of eddoes enclosed by a kind of dike to cause a stagnation, as that plant succeeds best in swampy ground. Its leaves serve as food for hogs, and the country-people use the roots for their own nourishment.

The sweet potatoe is planted for the same purpose, and makes a principal article of diet; together with chestnuts, which grow in extensive woods, on the higher parts of the island, where the vine will not thrive. Wheat and barley are likewise sown, especially in spots where the vines are decaying through age, or where they are newly planted. But the crops do not produce above three months provisions; and the inhabitants are therefore obliged to have recourse to other food, besides importing considerable quantities of corn from North America in exchange for wine. The want of manure, and the inactivity of the people, are in some measure the causes of this disadvantage; but supposing husbandry to be carried to its perfection here, they could not raise corn sufficient for their consumption. They make their threshing-floors of a circular form, in a corner of a field, which is cleared and beaten solid for the purpose. The sheaves are laid round about it; and a square board, stuck full of sharp flints below, is dragged over them by a pair of oxen, the driver getting on it to increase its weight. This machine cuts the straw as if it had been chopped, and frees the grain from the husk, from which it is afterwards separated.

The great produce of Madeira is the wine, from which it has acquired fame and support. Where the soil, exposure, and supply of water, will admit of it, the vine is cultivated. One or more walks, about a yard or two wide, intersect each vineyard, and are included by stone-walls two feet high. Along these walks, which are arched over with laths about seven feet high, they erect wooden pillars at regular distances, to support a lattice-work of bamboos, which slopes down from both sides of the walk, till it is only a foot and a half or two feet high, in which elevation it extends over the whole vineyard. The vines are in this manner supported from the ground, and the people have room to root out the weeds which spring up between them. In the season of the vintage they creep under this lattice-work, cut off the grapes, and lay them into baskets: some bunches of these grapes weigh six pounds and upwards. This method of keeping the ground clean and moist, and ripening the grapes in the shade, contributes to give the Madeira wines that excellent flavour and body for which they are remarkable. The owners of vineyards are however obliged to allot a certain spot of ground for the growth of bamboos; for the lattice-work cannot

Madeira  
Madox.

Madrid  
Madrid.

be made without them; and it is said some vineyards lie quite neglected for want of this useful weed.

The wines are not all of equal goodness, and consequently of different prices. The best, made of a vine imported from Candia by order of the Infante of Portugal, Don Henry, is called *Madeira Malmsey*, a pipe of which cannot be bought on the spot for less than 40 or 42 l. Sterling. It is an exceeding rich sweet wine, and is only made in a small quantity. The next sort is a dry wine, such as is exported for the London market, at 30 or 31 l. Sterling the pipe. Inferior sorts for the East India, West India, and North American markets, sell at 28, 25, and 20 l. Sterling. About 30,000 pipes, upon a mean, are made every year, each containing 110 gallons. About 13,000 pipes of the better sorts are exported; and all the rest is made into brandy for the Brazils, converted into vinegar, or consumed at home.

The inclosures of the vineyards consist of walls, and hedges of prickly pear, pomegranates, myrtles, brambles, and wild roses. The gardens produce peaches, apricots, quinces, apples, pears, walnuts, chestnuts, and many other European fruits; together with now and then some tropical plants, such as bananas, goavas, and pine-apples.

All the common domestic animals of Europe are likewise found at Madeira; and their mutton and beef, though small, is very well tasted. Their horses are small, but sure-footed; and with great agility climb the difficult paths, which are the only means of communication in the country. They have no wheel-carriages of any kind; but in the town they use a sort of drays or sledges, formed of two pieces of plank joined by cross pieces, which make an acute angle before; these are drawn by oxen, and are used to transport casks of wine, and other heavy goods, to and from the warehouses.

The animals of the feathered tribe, which live wild here, are more numerous than the wild quadrupeds; there being only the common grey rabbit here, as a representative of the last-mentioned class. Tame birds, such as turkeys, geese, ducks, and hens, are very rare, which is perhaps owing to the scarcity of corn.

There are no snakes whatsoever in Madeira; but all the houses, vineyards, and gardens, swarm with lizards. The friars of one of the convents complained to Mr Forster, that these vermin destroyed the fruit in their garden; they had therefore placed a brass-kettle in the ground to catch them, as they are constantly running about in quest of food. In this manner they daily caught hundreds, which could not get out on account of the smooth sides of the kettle, but were forced to perish.

The shores of Madeira, and of the neighbouring Salvages and Desertas, are not without fish; but as they are not in plenty enough for the rigid observance of Lent, pickled herrings are brought from Gotteaburg in English bottoms, and salted cod from New York and other American ports, to supply the deficiency.

MADNESS, a most dreadful kind of delirium, without a fever. See (the *Index* subjoined to) MEDICINE.

MADDOX (Dr Isaac), an ingenious and worthy prelate, born of obscure parents about the year 1696, who placed him apprentice to a pastry-cook; but not

relishing this employment, and having an inclination to learning, he was put to school by some friends, and completed his studies at Aberdeen. He entered into orders; and having the good fortune to be made chaplain to Dr Bradford bishop of Chichester, he married his niece, a very sensible and worthy lady. From this time his preference may be dated: he was made king's chaplain, clerk of the closet to queen Caroline, and about the year 1736 bishop of St Asaph; from whence, in 1743, he was translated to Worcester. He was an excellent preacher, and a great promoter of public charities; particularly the Worcester infirmary, and the hospital for inoculating the small-pox at London: his sermon in favour of this latter institution, preached in 1752, was much admired, and contributed greatly to extend the practice of inoculation. He published some other single sermons, and *A defence of the doctrine and discipline of the church of England*, in answer to Mr Neale's *History of the Puritans*. Dr Maddox died in 1759.

MADRASS. See *St GEORGE*.

MADRE DE PORA, a town and convent of South America, in Terra Firma, seated on the river Grande. It is almost as much resorted to by pilgrims of America, as Loretto is in Europe; and the image of the Virgin Mary is said to have done many miracles in favour of the sea-faring people. W. Lon. 76. o. N. Lat. 11. o.

MADRID, a town of New Castile in Spain, and capital of the whole kingdom, though it never had the title of a *city*, is situated in W. Lon. 3. 5. N. Lat. 40. 26. It stands in the centre of a large plain, surrounded with mountains, and in the very heart of Spain, on the banks of the little river Manzanares, which is always very low and shallow, except when it is swelled by the melting of the snow on the mountains. The streets here are wide, straight, and handsome, and adorned with several fine fountains; the houses fair and lofty, but built of brick, with lattice-windows, excepting those of the rich, who have glass in their windows; only, during the summer-heats, they use gauze, or some such thin stuff, instead of it, to let in the fresh air. There are two stately bridges here over the Manzanares, several beautiful squares, a great many magnificent churches, convents, palaces, and hospitals: among the last is one for all nations and distempers, with a large revenue. Around the placemayor, or grand square, are piazzas, with houses all uniform, and a continued line of balconies, for viewing the bull-fights and other public shows exhibited in it. The royal palace, which stands on the west side of the town, on an eminence, is spacious and magnificent, consisting of three courts, and commanding a fine prospect. At the east end of the town is the Prado, or pardo; which is a delightful plain, planted with regular rows of poplar trees, and watered with a great many fountains; where the nobility and gentry take the air on horseback, or in their coaches, and the common people on foot, or divert themselves with a variety of sports and exercises. The compass of the whole town is computed at about nine miles, and the number of its inhabitants at about 150,000. It is well supplied with provisions of all kinds, at reasonable rates; and the court, with the resort and residence of the quality, and the high colleges and offices that are kept

Madrigal  
Mæcenas.

kept here, occasion a brisk trade and circulation of money. There are three royal academies; one for the improvement of the Spanish language, another for history, and another for medicine. Nothing, in short, is wanting to make this place extremely commodious and agreeable, but cleanliness; which, it seems, is not such a favourite with the inhabitants as it deserves. The environs are very pleasant, and contain several royal seats; among which are El Buen Retiro, Casa del Campo, Florida, Le Pardo, Sarfuela, and St Ildefonso; but the most magnificent, not only in this country, but perhaps in the whole world, is the Escorial, which takes its name from a small village, near which it stands, about 22 miles north-west from Madrid; and of which a description is given under the article ESCURIAL. Another royal palace, greatly admired, particularly for its delicious gardens and surprising water-works, is Aranjuez, which is situated on the Tagus, about 30 miles south of Madrid.

MADRIGAL, a short amorous poem, composed of a number of free and unequal verses, neither confined to the regularity of a sonnet, nor to the point of an epigram; but only consisting of some tender and delicate thought, expressed with a beautiful, noble, and elegant simplicity.

Menage derives the word from *mandra*, which, in Latin and Greek, signifies "a sheep-fold;" imagining it to have been originally a kind of pastoral, or shepherd's song; whence the Italians formed their *madrigale*, and we *madrigal*. Others rather choose to derive it from the word *madrugar*, which, in the Spanish language, signifies "to rise in the morning;" the *madrigaler* being formerly sung early in the morning by those who had a mind to serenade their mistresses.

MADURA, a province of Asia, in the peninsula on this side the Ganges; bounded on the east by Tanjour and Marava, on the south-east by the sea, on the west by the Balagate mountains, which separate it from Malabar, and on the north by Vissapour and Carnate. The inhabitants are Gentoos, and of a thievish disposition. The commodities are rice, elephants teeth, and cotton-cloth; of which last a great deal is made here, and very fine. The Dutch have a pearl-fishery, which brings them in a large sum annually.

MEANDER, (anc. geog.), a river rising in Phrygia from a common source with the Maryas near Celæne, according to Maximus Tyrius an eye-witness: remarkable for its windings, (Ovid); whence the proper name *Meander* is become an appellative. It runs from east to west, till it discharges itself into the Ægean sea, about a mile from Miletus. A narrow river, but very deep, (Calaber); running calm, and fertilizing the country, as it passes along, with its mud, (Pliny).

MÆCENAS (Caius Cilnius), the great friend and counsellor of Augustus Cæsar, was himself a very polite scholar, but is chiefly memorable for having been the patron and protector of men of letters. He was descended from a most ancient and illustrious origin, even from the kings of Etruria, as Horace often tells us; but his immediate forefathers were only of the equestrian order. He is supposed to have been

born at Rome, because his family lived there; but in what year, antiquity does not tell us. It says as little about his education; but we know it must have been of the most liberal kind, and perfectly agreeable to the dignity and splendor of his birth, since he excelled in every thing that related to arms, politics, and letters. How Mæcenas spent his younger years is also unknown to us, any farther than by effects; there being no mention made of him, by any writer, before the death of Julius Cæsar, which happened in the year of Rome 709. Then Octavius Cæsar, who was afterwards called *Augustus*, went to Rome, to take possession of his uncle's inheritance; and then Mæcenas became first publicly known, though he appears to have been Augustus's intimate friend, and, as it should seem, guardian, from his childhood. From that time he accompanied him through all his fortunes, and was his counsellor and adviser upon all occasions; so that Peto Albinovanus justly called him *Cæsar's dextram*, "Cæsar's right-hand."

In A. R. 710, the year that Cicero was killed and Ovid born, Mæcenas distinguished himself by his courage and military skill at the battle of Modena, where the consuls Hirtius and Panfa were slain in fighting against Antony; as he did afterwards at Philippi. After this last battle began the memorable friendship between Mæcenas and Horace. Horace, as Suetonius relates, was a tribune in the army of Brutus and Cassius, and, upon the defeat of those generals, made a prisoner of war. Mæcenas, finding him an accomplished man, became immediately his friend and protector; and afterwards recommended him to Augustus, who resorted to him his estate, with no small additions. In the mean time, though Mæcenas behaved himself well as a soldier in these and other battles, yet his principal province was that of a minister and counsellor. He was the adviser, the manager, the negotiator, in every thing that related to civil affairs. When the league was made at Brundisium between Antony and Augustus, Mæcenas was sent to act on the part of Augustus. This we learn from Horace, in his journey to Brundisium:

*Hoc venturus erat Mæcenas optimus, atque  
Cocceius, missi magnis de rebus uterque  
Legati, aversos soliti componere amicos.* Sat. v. l. 1.

And afterwards, when this league was near breaking, through the suspicions of each party, Mæcenas was sent to Antony, to ratify it anew.

In the year 717, when Augustus and Agrippa went to Sicily to fight Sextus Pompeius by sea, Mæcenas went with them; but soon after returned, to appease some commotions which were rising at Rome: for though he usually attended Augustus in all his military expeditions, yet, whenever there was any thing to be done at Rome, either with the senate or people, he was always dispatched thither for that purpose.

Upon the total defeat of Antony at Actium, Mæcenas returned to Rome, to take the government into his hands, till Augustus could settle some necessary affairs in Greece and Asia. Agrippa soon followed Mæcenas; and when Augustus arrived, he placed these two great men and faithful adherents, the one over his civil, the other over his military concerns. While Augustus

Mæcenas.

gustus was extinguishing the remains of the civil war in Asia and Egypt, young Lepidus, the son of the triumvir, was forming a scheme to assassinate him at his return to Rome. This conspiracy was discovered at once, by the extraordinary vigilance of Mæcenas; who, as Velleius Paterculus says, "observing the rash councils of the headstrong youth with the same tranquillity and calmness as if nothing at all had been doing, instantly put him to death, without the least noise and tumult; and by that means extinguished another civil war in its very beginning."

The civil wars being now at an end, Augustus returned to Rome; and from this time Mæcenas indulged himself, at vacant hours, in literary amusements, and the conversation of men of letters. In the year 734 Virgil died, and left Augustus and Mæcenas heirs to what he had. Mæcenas was excessively fond of this poet, who, of all the wits of the Augustan age, stood highest in his esteem; and, if the *Georgics* and the *Æneid* be owing to the good taste and encouragement of this patron, as there is some reason to think, posterity cannot commemorate him with too much gratitude. Horace may be ranked next to Virgil in Mæcenas's good graces: we have already mentioned, how and at what time their friendship commenced. Propertius also acknowledges Mæcenas for his favourite and protector, lib. ii. eleg. 7. Nor must Varius be forgot, though we have nothing of his remaining; since we find him highly praised by both Virgil and Horace. He was a writer of tragedies; and Quintilian thinks he may be compared with any of the ancients. In a word, Mæcenas's house was a place of refuge and welcome to all the learned of his time; not only to Virgil, Horace, Propertius, and Varius, but to Fundarius, whom Horace extols as an admirable writer of comedies; to Tuscus Ariftius, a noble grammarian; and Horace's intimate friend; to Plotius Tucca, who assisted Varius in correcting the *Æneid* after the death of Virgil; to Valgius, a poet and very learned man, who, as Pliny tells us, dedicated a book to Augustus *De usu herbarum*; to Asinius Pollio, an excellent tragic writer; and to several others, whom it would be tedious to mention. All these dedicated their works, or some part of them at least, to Mæcenas, and celebrated his praises in them over and over; and we may observe farther, what Plutarch tells us, that even Augustus himself inscribed his Commentaries to him and to Agrippa.

Mæcenas continued in Augustus's favour to the end of his life, but not uninterruptedly. Augustus had an intrigue with Mæcenas's wife; and, though the minister bore this liberty of his master's very patiently, yet there was a coldness on the part of Augustus, which, however, soon went off. Mæcenas died in the year 745, but at what age we cannot precisely determine; though we know he must have been old. He must have been older than Augustus, because he was a kind of tutor to him in his youth; and then find him often called an *old man* by Pædo Albinovanus, a cotemporary poet, whose elegy upon his dead patron is still extant. He made Augustus his heir; and recommended his friend Horace to him, in those memorable last words, "*Horatii*

*Flacci, ut mei, memor esto, &c.*" Horace, however, did not probably survive him long, as there is no elegy of his upon Mæcenas extant, nor any account of one having ever been written, which there certainly would have been, had Horace survived him any time. Nay, father Sanadon, the French editor of Horace, will have it, that the poet died before his patron; and that these last words were found only in Mæcenas's will, which had not been altered.

Mæcenas is said never to have enjoyed a good state of health in any part of his life; and many singularities are related of his bodily constitution. Thus Pliny tells us, that he was always in a fever; and that, for three years before his death, he had not a moment's sleep. Though he was certainly an extraordinary man, and possessed many admirable virtues and qualities, yet it is agreed on all hands, that he was very luxurious and effeminate. "Mæcenas (says Velleius Paterculus,) was of the equestrian order, but sprung from a most illustrious origin. He was a man, who, when business required, was able to undergo any fatigue and watching; who consulted properly upon all occasions, and knew as well how to execute what he had consulted; yet a man, who, in seasons of leisure, was luxurious, soft, and effeminate, almost beyond a woman. He was no less dear to Cæsar than Agrippa, but distinguished by him with fewer honours; for he always continued of the equestrian rank, in which he was born: not that he could not have been advanced upon the least intimation, but he never solicited it."

But let moralists and politicians determine of Mæcenas as they please, the men of letters are under high obligations to celebrate his praises, and revere his memory: for he countenanced, protected, and supported, as far as they wanted his support, all the wits and learned men of his time; and that too, out of a pure and disinterested love of letters, when he had no little views of policy to serve by their means: whence it is no wonder, that all the protectors and patrons of learning, ever since, have usually been called *Mæcenas's*.

MAELSTROM, a very dangerous whirlpool on the coast of Norway, in the 68th degree of latitude, in the province of Nordland, and the district of Lofoden, and near the island of Moskoe, from whence it also takes the name of *Moskoe-strom*. Its violence and roarings exceed that of a cataract, being heard to a great distance, and without any intermission, except a quarter every sixth hour, that is, at the turn of high and low water, when its impetuosity seems at a stand, which short interval is the only time the fishermen can venture in: but this motion soon returns, and, however calm the sea may be, gradually increases with such a draught and vortex as absorb whatever comes within their sphere of action, and keep it under water for some hours, when the fragments, shivered by the rocks, appear again. This circumstance, among others, makes strongly against Kircher and others, who imagine that there is here an abyss penetrating the globe, and issuing in some very remote parts, which Kircher is so particular as to assign, for he names the gulph of Bothnia. But after the most exact researches which the circumstances will admit, this is but a conjecture without foundation; for this and three other vortices

Mæcenas, Mælfstrom

Mælftröm.

vortices among the Ferroe iflands, but smaller, have no other caufe, than the collision of waves rifing and falling, at the flux and reflux, againft a ridge of rocks and fhelves, which confine the water fo that it precipitates itfelf like a cataract; and thus the higher the flood rifes, the deeper muft the fall be; and the natural refult of this is a whirlpool or vortex, the prodigious fuction whereof is fufficiently known by leffer experiments. But what has been thus abforbed, remains no longer at the bottom than the ebb lafts; for the fuction then ceafes, and the flood removes all attraction, and permits whatever had been funk to make its appearance again. Of the fituation of this amazing Mofkoeftröm we have the following account from Mr Jonas Ramus, "The mountain of Helfeggen, in Lofoden, lies a league from the ifland Ver, and betwixt thefe two runs that large and dreadful fream called *Mofkoeftröm*, from the ifland Mofkoe, which is in the middle of it, together with feveral circumjacent ifles, as Ambarcn, half a quarter of a league northward, Ifefen, Hoeholm, Kieldholm, Suarven, and Buckholm. Mofkoe lies about half a quarter of a mile fouth of the ifland of Ver, and betwixt them thefe fmall iflands, Otterholm, Flimen, Sandfiefen, Skarholm. Betwixt Lofoden and Mofkoe, the depth of the water is between 36 and 40 fathoms; but on the other fide, towards Ver, the depth increafes fo as not to afford a convenient paffage for a veflel, without the rifk of fplitting on the rocks, which happens even in the calmefl weather: when it is flood, the fream runs up the country betwixt Lofoden and Mofkoe, with a boifterous rapidity; but the roar of its impetuous ebb to the fea, is fcarce equalled by the loudeft and moft dreadful cataracts; the noife being heard feveral leagues off, and the vortices or pits are of fuch an extent and depth, that if a fhip comes within its attraction, it is inevitably abforbed and carried down to the bottom, and there beat to pieces againft the rocks; and when the water relaxes, the fragments thereof are thrown up again. But thefe intervals of tranquillity are only at the turn of the ebb and flood, in calm weather; and laft but a quarter of an hour, its violence gradually returning. When the fream is moft boifterous, and its fury heightened by a ftorm, it is dangerous to come within a Norway mile of it; boats, fhips, and yachts having been carried away, by not guarding againft it before they were within its reach. It likewife happens frequently, that whales come too near the fream, and are overpowered by its violence; and then it is impoffible to defcribe their howlings and bellowsings in their fruitiefs struggles to difengage themfelves. A bear once attempting to fwim from Lofoden to Mofkoe, with a defign of preying upon the fheep at pafture in the ifland, afforded the like fpectacle to the people; the fream caught him, and bore him down, whilft he roared terribly, fo as to be heard on fhore. Large flocks of firs and pine trees, after being abforbed by the current, rife again, broken and torn to fuch a degree, as if briffles grew on them. This plainly fhews the bottom to confift of craggy rocks, among which they are whirled to and fro. This fream is regulated by the flux and reflux of the fea; it being conftantly high and low water every fix hours. In the year 1645, early in the morning of Sexagefima Sunday, it raged with fuch noife and impetuofity, that on the

ifland of Mofkoe, the very ftones of the houfes fell to the ground."

**MÆMACTERION**, the fourth month of the Athenian year, confifting of only 29 days, and answering to the latter part of September and the beginning of October.

**MÆNA**, in ichthyology. See SPARUS.

**MÆONIA**, (anc. geog.), a town of Lydia, fittuate at the foot of mount Tmolus. *Mæonii*, the people. *Mæonis*, (Homer, Ovid), the feminine gentilities name: hence *Mæonides*, the mufes, (Ovid). *Mæonides* denotes alfo Homer, (Ovid).

**MÆOTIS PALUS** or **LACUS**, *Mæotica Palus*, or *Mæoticus Lacus*, (anc. geog.), a lake of Sarmatia Europea, extending from the Isthmus to the mouth of the Tanais to the eaft, in compafs 9000 ftadia, (Strabo). Still called *Palus Mæotis*, reaching from Crim Tartary to the mouth of the Don.

**MÆSTLIN** (Michael), in Latin *Mæflinus*, a celebrated aftronomer of Germany, was born in the duchy of Wittemberg; but fpent his youth in Italy, where he made a fpeech in favour of Copernicus's fyftem, which brought Galileo over from Aristotle and Ptolemy, to whom he had been hitherto entirely devoted. He afterwards returned to Germany, and became profeflor of mathematics at Tübingen; where, among his other fcholars, he taught the great Kepler, who has praifed feveral of his ingenious inventions, in his *Aftronomia Optica*. Though Tycho Brahe did not affent to Mæftlin's opinion, yet he allowed him to be an extraordinary perfon deeply fkill'd in the fciences of aftronomy. Mæftlin published many mathematical and aftronomical works; and died in 1590.

**MÆSTRICHT**, an ancient, large, and ftrong town of the Netherlands, ceded to the Dutch by the treaty of Munfter. The town-houfe and the other public buildings are handfome, and the place is about four miles in circumference, and ftrongly fortified. It is governed jointly by the Dutch and the bifhop of Liege; however, it has a Dutch garrifon. The inhabitants are noted for making excellent fire-arms, and fome fay that in the arfenal there are arms fufficient for a whole army. Both Papifts and Proteftants are allowed the free exercife of their religion, and the magiftrates are compofed of both. It is feated on the river Maele, which feparates it from Wyck, and with which it communicates by a handfome bridge. Mæftricht revolted from the Spaniards in 1570, but was reduced in 1579. Lewis XIV. became mafter of it in 1673; but it was reftored to the ftates by the treaty of Nimeguen in 1678. E. Long. 5. 50. N. Lat. 51. 5.

**MAFFÆUS** (Vegio), a Latin poet, born in Lombardy in 1407, was greatly admired in his time. He wrote epigrams, and a humorous fupplement to Virgil, which he called *The thirteenth book of the Æneid*: this was as humoroufly tranflated into Englifh a few years fince by Mr Ellis. Maffæus wrote alfo fome profeworks. He was chancellor of Rome towards the end of the pontificate of Martin V.; and died in 1458.

**MAFFEI** (Scipio), a celebrated Italian poet, born of an illuftrious and ancient family at Verona, in 1675. After having finifhed his ftudies, he took arms, and diftinguifhed himfelf by his valour at the battle of Do-

nawest; but he more particularly distinguished himself by his love of learning, which made him undertake several voyages into France, England, and Germany. He conversed with the learned in all those countries, and obtained their friendship and esteem. He was a member of the Academy of the Arcadia at Rome, an honorary foreign member of that of Inscriptions at Paris; and died in 1755. He wrote many works in verse and prose, which are esteemed; the most known of which are, 1. The tragedy of Merope, of which there are two French translations in prose. 2. Ceremony, a comedy. 3. A translation, into Italian verse, of the first book of Homer's Iliad. 4. Many other pieces of poetry, in a collection intitled *Rhyme and Prose*, quarto. His principal works in prose, are, 1. *Verona illustrata*. 2. *Istoria diplomatica*. 3. *Scienza cavalleresca*; an excellent work, in which he attacks duelling. 4. An edition of *Theatro Italiano*. 5. An edition of Calfiodorus on the Epistles, Acts of the Apostles, and Apocalypse. 6. *Gallia antiquitates quedam selectæ, atque in plures epistolas distributæ*, and several other works.

MAGADOXO, the capital town of a kingdom of the same name, in Africa, and on the coast of Ajan; seated near the mouth of a river of the same name, defended by a citadel, and has a good harbour. The inhabitants are Mohammedans. E. Long. 45. 15. N. Lat. 3. 0.

MAGAZINE, a place in which stores are kept, of arms, ammunition, provisions, &c. Every fortified town ought to be furnished with a large magazine, which should contain stores of all kinds, sufficient to enable the garrison and inhabitants to hold out a long siege; and in which smiths, carpenters, wheel-wrights, &c. may be employed in making every thing belonging to the artillery, as carriages, waggon, &c.

Powder-MAGAZINE, is that place where the powder is kept in very large quantities. Authors differ greatly both with regard to the situation and construction; but all agree, that they ought to be arched and bomb-proof. In fortifications, they are frequently placed in the rampart; but of late they have been built in different parts of the town. The first powder-magazines were made with Gothic arches: but M. Vauban finding them too weak, constructed them in a semicircular form; whose dimensions are 60 feet long within, 25 broad; the foundations are eight or nine feet thick, and eight feet high from the foundation to the spring of the arch; the floor is two feet from the ground, which keeps it from dampness.

One of our engineers of great experience some time since had observed, that after the centres of semicircular arches are struck, they settle at the crown and rise up at the hances, even with a straight horizontal extrados, and still much more so in powder-magazines, whose outside at top is supported like the roof of a house, by two inclined planes joining in an angle over the top of the arch, to give a proper descent to the rain; which effects are exactly what might be expected agreeable to the true theory of arches. Now, as this shrinking of the arches must be attended with very ill consequences, by braking the texture of the cement after it has been in some degree dried, and also by opening the joints of the voussiors at one end, so a remedy is pro-

vided for this inconvenience with regard to bridges, by the arch of equilibrium in Mr Hutton's book on bridges; but as the ill effect is much greater in powder-magazines, the same ingenious gentleman proposed to find an arch of equilibrium for them also, and to construct it when the span is 20 feet, the pitch or height 10, (which are the same dimensions as the semicircle), the inclined exterior walls at top forming an angle of 113 degrees, and the height of their angular point above the top of the arch equal to seven feet. This very curious question was answered in 1775, by the reverend Mr Wildbore, to be found in Mr Hutton's *Miscellanea Mathematica*.

Artillery-MAGAZINE. In a siege, the magazine is made about 25 or 30 yards behind the battery, towards the parallels, and at least three feet underground, to hold the power, loaded shells, port fires, &c. Its sides and roof must be well secured with boards to prevent the earth from falling in: a door is made to it, and a double trench or passage is sunk from the magazine to the battery, one to go in and the other to come out at, to prevent confusion. Sometimes traverses are made in the passages to prevent ricochet shot from plunging into them.

MAGAZINE, on ship-board, a close room or storehouse, built in the fore or after part of the hold, to contain the gun-powder used in battle. This apartment is strongly secured against fire, and no person is allowed to enter it with a lamp or candle: it is therefore lighted, as occasion requires, by means of the candles or lamps in the *light room* contiguous to it.

MAGDALEN, or *Nuns of St MAGDALEN*, an order of religious in the Romish church, dedicated to St Mary Magdalen, and sometimes called *Magdalenetter*. These consist chiefly of courtezans, who, quitting their profession, devote the rest of their lives to repentance and mortification.

MAGDALENA, one of the Marquesas islands, about five leagues in circuit, and supposed to be in S. Lat. 10. 25. W. Long. 138. 50. It was only seen at nine leagues distance by those who discovered it.

MAGDALENE'S CAVE, a cave of Germany, and in Carinthia, 10 miles east of Gortz. It appears like a chasm in a rock, and at the entrance torches are lighted to conduct travellers. It is divided into several apartments, or halls, with a vast number of pillars formed by nature, which give it a beautiful appearance, they being as white as snow, and almost transparent. The bottom is of the same substance, inasmuch that a person may fancy himself to be walking among the ruins of an enchanted castle, surrounded with magnificent pillars, some entire and others broken.

MAGDEBURG, a duchy of Germany, in the circle of Lower Saxony; bounded on the north by the duchy of Mecklenburg, on the south and south-west by the principality of Anhalt and Halberstadt, on the east by Upper Saxony with part of Brandenburg, and on the west by the duchy of Wolfenbuttel. The Saale circle, and that of Luxkenwalde, are separated from the rest, and surrounded on all sides by a part of Upper Saxony. This country is, for the most part, level; but sandy, marshy, or overgrown with woods. There are salt springs in it so rich, that they

Magazine  
Magdeburg

Magdeburg they are sufficient to supply all Germany with that commodity. The Holz circle is the most fruitful part of it. In the Saale circle, where wood is scarce, there is pit-coal; and at Rothenburg is a copper-mine worked. The duchy is well watered, for the Elbe passes through it; and the Saale, Havel, Aller, Ohre, and Elster, either rise in, or wash some part of it in their course. The whole duchy, exclusive of that part of the county of Mansfeld which is connected with it, is said to contain 29 cities, six towns, about 430 villages, and 330,000 inhabitants. The states of the country consist of the clergy, the nobility, and deputies of the cities. Before it became subject to the electoral house of Brandenburg, frequent diets were held in it; but at present no diets are held, nor have the states the direction of the finances as formerly. Before the Reformation, it was an archbishopric, subject in spirituals to the Pope alone, and its prelate was primate of all Germany; but embracing the Reformation, it chose itself administrators, till the treaty of Munster in 1648, when it was given, together with the bishopric of Halberstadt, to the elector of Brandenburg, as an equivalent for the Hither Pomerania, granted by that treaty to the king of Sweden. Lutheranism is the predominant religion here; but Calvinists, Jews, and Roman-catholics are tolerated. Of the last there are five convents, who never embraced the Reformation. All the Lutheran parishes, amounting to 314, are subject to 16 inspectors, under one general superintendent; only the clergy of the old town of Magdeburg are under the direction of their senior. The Jews have a synagogue at Halle. The manufactures of the duchy are cloth, stuffs, stockings, linen, oil-skins, leather, and parchment; of which, and grain of all sorts, large quantities are exported. The arms of it are, Party per pale, ruby, and pearl. The king of Prussia, as duke of Magdeburg, sits and votes between the elector of Bavaria, as duke of Bavaria, and the elector palatine, as palgrave of Lautern. Of the states of the circle of Lower Saxony he is the first. His matricular assessment for the duchy is 43 horse and 196 foot, or 1300 florins monthly; and to the chamber of Witzlar 343 florins and 40 kruitzers. For the civil government of the duchy there is a council of regency, with a war and demesne chamber; and for the ecclesiastical, a consistory, and general superintendent. The revenues of the duchy, arising from the salt-works, demesnes, and taxes, some of which are very heavy and oppressive, are said to amount to 800,000 rixdollars annually. With respect to salt, every house-keeper in the Prussian dominions is obliged to buy a certain quantity for himself and wife; and also for every child and servant, horse, cow, calf, and sheep, that he possesses. The principal places are Magdeburg, Halle, and Glauche.

MAGDEBURG, a city of Germany, in a duchy of the same name, of which it is not only the capital, but that of all Lower Saxony, and formerly even of all Germany. It stands on the Elbe, in E. Long. 12. 9. N. Lat. 52. 16. It is a city of great trade, strongly fortified, and very ancient. Its name signifies *the maiden city*; which, some imagine, took its rise from the temple of Venus, which is said to have stood here anciently, and to have been destroyed by

Charlemagne. The founder of the city is supposed to have been Otho I. or his empress Editha, daughter to Edmund the Saxon king of England. The same emperor founded a Benedictine convent here, which he afterwards converted into an archbishopric, of which the archbishop was a count-palatine, and had very great privileges, particularly that of wearing the archiepiscopal pallium, and having the cross borne before him, besides many others. The first tournament in Germany is said to have been appointed near this city, by the emperor Henry the Fowler; but these pallimes were afterwards abolished, because they occasioned such envy and animosity among the nobility, that several of them killed one another upon the spot. The situation of the city is very convenient and pleasant, upon the banks of the Elbe, amidst spacious fruitful plains, and on the road betwixt High and Low Germany. It has been a great sufferer by fires and sieges; but by none so much as that in 1631, when the emperor's general, count Tilly, took it by storm, plundered and set it on fire, by which it was entirely reduced to ashes, except the cathedral, the convent of our Lady, and a few cottages belonging to fishermen; of 40,000 burghers not above 400 escaping. The soldiers spared neither age nor sex; but ripped up women with child, murdered sucking infants in sight of their parents, and ravished young women in the streets; to prevent which violation, many of them flung themselves into the Elbe, and others into the fire. The city is now populous, large, and well built, particularly the broad street and cathedral-square. The principal buildings are the king's palace, the governor's house, the armoury, guild-hall, and cathedral. The last is a superb structure in the antique taste, dedicated to St Maurice, which has a fine organ, the master-pipe of which is so big, that a man can scarce clasp it with both arms; it also contains the tombs of the emperor Otho, and the empress Editha; a fine marble statue of St Maurice, a porphyry font, an altar in the choir of one stone of divers colours, curiously wrought, and many other curiosities. They shew here a bedstead and table which belonged to Martin Luther, when he was an Augustine friar in a cloister of this city before the Reformation. Among the reliques, they pretend to have the basin in which Pilate washed his hands after his condemnation of our Saviour; the lantern which Judas made use of when he apprehended him; and the ladder on which the cock crowed after St Peter denied him. The chapter consists of a provost, 16 major, and seven minor canons; besides which, there are four other Lutheran collegiate foundations, and a Lutheran convent dedicated to our Lady, in which is a school or seminary. Here is also a gymnasium, with an academy, in which young gentlemen are instructed in the art of war. The canons of the chapter, which, except the change of religion, is upon the same footing as before the Reformation, must make proof of their nobility. The prebends and dignities are all in the gift of the elector; and the revenue of the provost is computed at 12,000 crowns a-year. Here is a great trade, and a variety of manufactures. The chief are those of woollen cloths and stuffs, silks, cottons, linen, stockings, hats, gloves, tobacco and snuff. The city was formerly one of the Hanse and

Magellan. imperial towns. Editha, comfort to Otho I. on whom it was conferred as a dowry, among many other privileges and advantages, procured it the grant of a yearly fair. The bargavate of this city was anciently an office of great power; having the civil and criminal jurisdiction, the office of hereditary cup-bearer being annexed to it; and was long held as a fief of the archbishops, but afterwards became an imperial fief, which was again conferred on the archbishopric by the elector of Saxony, upon certain conditions.

MAGELLAN (Ferdinand), a celebrated Portuguese mariner in the 16th century. He being dissatisfied with the king of Portugal, went into the service of the emperor Charles V. and sailed from Seville with five vessels in 1519, when he discovered and passed the strait to which he gave his own name, and sailed through the South Sea to the Ladrone Islands, when, according to some authors, he was poisoned in 1520; though others say that he was killed in a mutiny of his people, in the island of Mutan, on account of his severity. His voyage round the world was written by one on board, and has been frequently printed in English. His suddenly converting to the Christian religion people whose language was unknown to him, as his was to them, is an absurdity that discredits this work.

*Straits of MAGELLAN*, a narrow passage between the island of Terra del Fuego, and the southern extremity of the continent of America. This passage was first discovered by Ferdinand Magellan, who sailed through it into the South Sea, and from thence to the East-Indies. Other navigators have passed the same way; but as these straits are exceedingly difficult, and subject to storms, it has been common to sail by Cape Horn, rather than through the Straits of Magellan. See *Straits Le MAIRE*, and *TERRA del Fuego*.

MAGGI (Jerome), in Latin *Magius*, one of the most learned men of the 16th century, was born at Anghiari in Tuscany. He applied himself to all the sciences, and even to the art of war; and distinguished himself so much in this last study, that the Venetians sent him into the island of Cyprus in quality of judge of the admiralty. When the Turks besieged Famagusta, he performed all the services that could be expected from the most excellent engineer: he invented mines and machines for throwing fire, by means of which he destroyed all the works of the besiegers, and in an instant overthrew what had cost the Turks infinite labour. But they had their revenge; for, taking the city in 1571, they plundered his library, carried him loaded with chains to Constantinople, and treated him in the most inhuman and barbarous manner. He nevertheless comforted himself from the example of Æsop, Menippus, Epictetus, and other learned men; and, after passing the whole day in the meanest drudgery, he spent the night in writing. He composed, by the help of his memory alone, treatises filled with quotations, which he dedicated to the Imperial and French ambassadors. These ministers, moved by compassion for this learned man, resolved to purchase him: but while they were treating for his ransom, Maggi found means to make his escape, and to get to the Imperial ambassador's house; when the Grand Vizir being enraged at his flight, and remembering

the great mischief he had done the Turks during the siege of Famagusta, sent to have him seized, and caused him to be strangled in prison in 1572. His principal works are, 1. A treatise on the bells of the ancients. 2. On the destruction of the world by fire. 3. Commentaries on Æmilius Probus's lives of illustrious men. 4. Commentaries on the institutes. These works are written in elegant Latin. He also wrote a treatise on fortification in Italian; and a book on the situation of ancient Tuscany.

He ought not to be confounded with his brother *Bartholomew Maggi*, a physician at Bologna, who wrote a treatise of gun-shot wounds; nor with *Vincent Maggi*, a native of Bresce, and a celebrated professor of humanity at Ferrara in Padua, who was the author of several works.

MAGGOT, the common name of the fly-worm bred in flesh, from the egg of the great blue fly. Notwithstanding the distaste for this animal, its figure and structure of parts are greatly worth attending to; and may serve as a general history of the class of worms produced from the eggs of flies.

This animal is white and fleshy; its body is composed of a number of rings, like the bodies of caterpillars and other similar insects; and is capable, at the pleasure of the animal, of assuming different figures; being at times more or less extended in length, and consequently more or less thick.

Notwithstanding that this animal has no legs, it is able to move itself very swiftly; and in its first attempt to move its body, is extended to its greatest length, and assumes something of the figure of a pointed cone. The pointed part of this cone is the head of the animal, and is not separated from the next ring by any deeper furrow than the rest of the rings are from one another. In some states of the animal, one may see two short horns thrust out from the head; but more generally two scaly hooks are observable: these are, however, sometimes hid, and have each of them a cæfe or sheath, into which the animal can retract them at pleasure. These hooks are bent into an arch, the concavity of which is towards the plane on which the creature is placed; and they are the thickest at their insertion in the head, and thence diminish gradually, till they terminate in a fine sharp point.

These two hooks are placed in a parallel direction, and can never come together, and therefore cannot serve in the place of teeth for grinding the food; but merely to pull and sever it in pieces, that it may be of a proper size for the mouth of the creature. Besides these hooks the maggot has a kind of dart, which is about a third part of their length, and is placed at an equal distance between them. This also is brown and scaly like them; it is quite straight, and terminates in a fine point. The hooks have as it were two scaly thorns at their points; and this dart seems intended, by reiterated strokes, to divide and break the pieces of flesh these have separated from the rest into smaller parts. Immediately below the apertures for the egress of the hooks, is placed the mouth of the animal; the creature does not chew this little opening unless pressed: but if the pressure is properly managed, it will sufficiently open it, and there may be discovered within it a small protuberance, which may very naturally be supposed either the tongue or the sucker of the animal.

mal. The hooks in these creatures not only supply the place of teeth, but also of legs; since it is by fastening these hooks into the substance it is placed on, and then drawing up its body to it, that it pulls itself along;

The back of this creature lowers itself by degrees as it approaches the extremity of the belly; and near the place where the back begins to lower itself, are placed the creature's two principal organs of respiration. One may perceive there two small roundish brown spots: they are very easily distinguishable by the naked eye, because the rest of the body of the creature is white; but if we take in the assistance of glasses, each of these spots appears to be a brown circular eminence raised a little above the rest of the body. On each of these spots one may also discover three oblong oval cavities, something of the shape of button-holes; these are situated in a parallel direction to one another, and their length nearly in a perpendicular direction to that of the body of the animal. These apertures are so many stigmata or air-holes; openings destined to admit the air necessary to the life of the animal. It has six of these stigmata, three in each side of its body.

The great transparency of the body of this animal gives us an opportunity also to distinguish that it has on each side a large white vessel running the whole length of the body. It is easy to follow the course of these vessels through their whole length, but they are most distinct of all towards its hinder part; and they are always seen to terminate each in the brown-spot abovementioned: this leaves us no room to doubt that they are the two principal tracheæ.

The ramifications of the two great tracheæ are very beautifully seen in this creature; especially on its belly: and it is remarkable, that no vessel analogous to the great artery in the caterpillar class can be discovered in these; though, if there were any such, their great transparency must needs make them very easily distinguishable; nor could its dilatations and contractions, if so considerable as in that class of animals, be less so. See ERUCA.

Malpighi imagined that this artery in the caterpillar class was a series of hearts; in its place, however, there may be seen in these animals a true heart. It is easy to observe in these creatures, about the fourth ring of their body, a small fleshy part, which has alternate contractions and dilatations; and is not only discoverable in the body by means of its transparency, but on making a proper section of them in the second, third, and fourth, will be thrown out of the body of the creature, and continue its beats for some time afterwards.

MAGI, or MAGIANS, an ancient religious sect in Persia, and other Eastern countries, who maintained that there were two principles, one the cause of all good, the other the cause of all evil: and, adorning the adoration of images, they worshipped God only by fire; which they looked upon as the brightest and most glorious symbol of Oromasdes, or the good God; as darkness is the truest symbol of Arimanus, or the evil god. This religion was reformed by Zoroaster, who maintained that there was one supreme independent Being; and under him two principles or angels, one the angel of goodness and light, and the other of evil and darkness: that there is a perpetual struggle be-

tween them, which shall last to the end of the world; that then the angel of darkness and his disciples shall go into a world of their own, where they shall be punished in everlasting darkness; and the angel of light and his disciples shall also go into a world of their own, where they shall be rewarded in everlasting light.

The priests of the magi were the most skilful mathematicians and philosophers of the ages in which they lived, inasmuch that a learned man and a magician became equivalent terms. The vulgar looked on their knowledge as supernatural; and hence those who practised wicked and mischievous arts, taking upon themselves the name of *magians*, drew on it that ill significance which the word magician now bears among us.

This sect still subsists in Persia under the denomination of *gaurs*, where they watch the sacred fire with the greatest care, and never suffer it to be extinguished.

MAGIC, MAGIA, *MATEIA*, in its ancient sense, the science, or discipline and doctrine of the magi, or wise-men of Persia. See MAGI.

The origin of magic and the magi is ascribed to Zoroaster: Salmalius derives the very name from Zoroaster, who, he says, was surnamed *Mog*, whence *Magus*. Others, instead of making him the author of the Persian philosophy, make him only the restorer and improver thereof; alleging, that many of the Persian rites in use among the magi, were borrowed from the Zabii among the Chaldeans, who agreed in many things with the magi of the Persians; whence some make the name *magus* common both to the Chaldeans and Persians. Thus Plutarch mentions, that Zoroaster instituted magi among the Chaldeans, in imitation whereof the Persians had theirs too.

MAGIC, in a more modern sense, is a science which teaches to perform wonderful and surprising effects.

The word *magic* originally carried with it a very innocent, nay laudable, meaning; being used purely to signify the study of wisdom, and the more sublime parts of knowledge: but in regard the ancient magi engaged themselves in astrology, divination, sorcery, &c. the term *magic* in time became odious, and was only used to signify an unlawful and diabolical kind of science, depending on the assistance of the devil and departed souls.

If any wonder how so vain and deceitful a science should gain so much credit and authority over mens minds, Pliny gives the reason of it. It is, says he, because it has possessed itself of three sciences of the most esteem among men; taking from each, all that is great and marvellous in it. Nobody doubts but it had its first origin in medicine; and that it insinuated itself into the minds of the people, under pretence of affording extraordinary remedies. To these fine promises it added every thing in religion that is pompous and splendid, and that appears calculated to blind and captivate mankind. Lastly, it mingled judiciary astrology with the rest; persuading people, curious of futurity, that it saw every thing to come in the heavens. Agrippa divides magic into three kinds; natural, celestial, and ceremonial or superstitious.

Natural MAGIC is no more than the application of natural active causes to passive subjects; by means whereof many surprising, but yet natural, effects are produced.

Baptista Porta has a treatise of natural magic, or of secrets for performing very extraordinary things by natural causes. The natural magic of the Chaldeans was nothing but the knowledge of the powers of simples and minerals. The magic which they called *theurgia*, consisted wholly in the knowledge of the ceremonies to be observed in the worship of gods, in order to be acceptable. By virtue of these ceremonies they believed they could converse with spiritual beings, and cure diseases.

*Celestial Magic*, borders nearly on judiciary astrology: it attributes to spirits a kind of rule or dominion over the planets, and to planets a dominion over men; and on those principles builds a ridiculous kind of system. See *ASTROLOGY*.

*Superstitious or Goetic Magic*, consists in the invocation of devils. Its effects are usually evil and wicked, though very strange and seemingly surpassing the powers of nature; supposed to be produced by virtue of some compact, either tacit or express, with evil spirits: but the truth is, these have not all the power that is usually imagined, nor do they produce those effects ordinarily ascribed to them.

Naude has published an apology for all the great men suspected of magic.—Agrippa says, that the words used by those in compact with the devil, to invoke him, and to succeed in what they undertake, are *Dies, mies, jesquet, benedisset, douvima, enitemaus*. There are an hundred other superstitious formulas of words composed at pleasure, or gathered from several different languages, or patched from the Hebrew, or formed in imitation of it.

The most ignorant and barbarous people have been most generally suspected of magic. Among ourselves, the most miserably ignorant persons have been accused of it. Among foreigners, the Laplanders and Icelanders have been supposed most conversant of all others in it. These people themselves place an absolute confidence in the effects of certain idle words and actions; and the rest of the world is deceived in the same manner. The famous *magical drum* of the Laplanders is still in constant use in that nation; and Scheffer, in his history of Lapland, has given an account of its structure.

This instrument is made of beech, pine, or fir, split in the middle, and hallowed on the flat side where the drum is to be made. The hollow is of an oval figure; and is covered with a skin clean dressed, and painted with figures of various kinds, such as stars, suns and moons, animals and plants, and even countries, lakes and rivers; and of latter days, since the preaching of Christianity among them, the acts and sufferings of our Saviour and his apostles are often added among the rest. All these figures are separated by lines into three regions or clusters.

There is, besides these parts of the drum, an index and a hammer. The index is a bundle of brass or iron rings, the biggest of which has a hole in its middle, and the smaller ones are hung to it. The hammer or drumstick is made of the horn of a rein-deer; and with this they beat the drum so as to make these rings move, they being laid on the top for that purpose. In the motion of these rings about the pictures figured on the drum, they fancy to themselves some prediction in regard to the things they inquire about.

What they principally inquire into by this instrument, are three things. 1. What sacrifices will prove most acceptable to their gods. 2. What success they shall have in their several occupations, as hunting, fishing, curing of diseases, and the like; and, 3. What is doing in places remote from them. On these several occasions they use several peculiar ceremonies, and place themselves in various odd postures as they beat the drum; which influences the rings to the one or the other side, and to come nearer to the one or the other set of figures. And when they have done this, they have a method of calculating a discovery, which they keep as a great secret, but which seems merely the business of the imagination in the diviner or magician.

*Magic-Square*, a square figure formed of a series of numbers in arithmetical proportion, so disposed in parallel and equal ranks, as that the sums of each row, taken either perpendicularly, horizontally, or diagonally, are equal.

The several numbers which compose any square number, (for instance, 1, 2, 3, 4, 5, &c. to 25 inclusive, which compose the square number 25), being disposed after each other in a square figure of 25 cells, each in its cell; if then you change the order of these numbers, and dispose them in the cells, in such manner, as that the five numbers which fill an horizontal rank of cells, being added together, shall make the same sum with the five numbers in any other rank of cells, whether horizontal or vertical; and even the same number with the five in each of the two diagonal ranks; this disposition of numbers is called a *magic-square*, in opposition to the former disposition, which is called a *natural square*.

Natural Square.

1	2	3	4	5
6	7	8	9	10
11	12	13	14	15
16	17	18	19	20
21	22	23	24	25

Magic-Square.

16	14	8	2	25
3	22	20	11	9
15	6	4	33	17
24	18	12	10	1
7	5	21	19	13

One would imagine that magic squares had that name given them in regard this property of all their ranks, which, taken any way, make always the same sum, appeared extremely surprising, especially in certain ignorant ages, when mathematics passed for magic. But there is a great deal of reason to suspect, that these squares merited their name still further by the superstitious operations they were employed in, as the construction of talismans, &c. For according to the childish philosophy of those days, which attributed virtues to numbers, what virtues might not be expected from numbers so wonderful?

However, what was at first the vain practice of makers of talismans and conjurers, has since become the subject of a serious research among mathematicians: not that they imagine it will lead them to any thing of solid use or advantage; magic squares favour too much of their original, to be of much use: but only as it is a kind of play, where the difficulty makes the merit; and as it may chance to produce some new views

Magician. of numbers which mathematicians will not lose the occasion of.

MAGIC *Lantern*. See DIOPTRICS, art. ix. p. 2478.

MAGICIAN, one who practises magic, or hath the power of doing wonderful feats by the agency of spirits.

Among the Eastern nations it seems to have been formerly common for the princes to have magicians about their court to confer with upon extraordinary occasions. And concerning these there hath been much dispute: some supposing that their power was only feigned, and that they were no other than impostors who imposed on the credulity of their sovereigns; while others have thought that they really had some unknown connection or correspondence with evil spirits, and could by their means accomplish what otherwise would have been impossible for men. The greatest difficulty is with regard to the magicians of Egypt, by St Paul called *Jannes* and *Jambres*, who opposed Moses and Aaron. From the account given of them in Scripture, it would seem that they had the art either of performing or counterfeiting certain miraculous actions, while others, seemingly as easy, they could neither perform nor counterfeit.

A very learned author tells us, that the origin of these magicians seems to have been this, That as God admitted the holy patriarchs to a familiar intercourse with him, so the devil kept men in obedience to him by pretending to discover secret things to them: and when God was pleased to work miracles to confirm the truth, the devil directed the latter how to invoke him for the performance of strange things, which confirmed them in their error.

With regard to the enchantments which they are said to make use of, if the Hebrew word came from *lahat*, a "flame," (Gen. iii. 24.) it shews that they dazzled mens eyes, and imposed upon them by false appearances. But it may be derived from *laat*, "hidden, or secret;" and so intimate to us, that they used secret whispers or murmurs, as enchanters did who were familiar with demons; and thus it is explained in Gemara sanhedrim.

A late learned and ingenious writer has obliged the public with several very curious remarks upon this subject, of the Egyptian magicians succeeding in several of their attempts to work miracles. He is not of the opinion that these wonders could possibly be done by any or all the powers of nature; nor does he agree with some authors, who imagine there was not any real transmutation, but that they played their parts as jugglers, pretending to do what they did not, or that some demons assisted them to deceive the sight of the beholders. For with regard to their impoling upon Pharaoh by artifice and pretence, this must inevitably have given Moses and Aaron an opportunity of detecting their imposture. And as to their being able to exhibit the appearances of serpents, frogs, and blood, when no such things were really in being, either by themselves or by the assistance of demons; this supposes them to have performed wonders, of which we can give as little account as of a miracle. But the question will recur, If they had no mystical arts to perform these things, how came they to succeed in the attempts which they made in opposition to Moses? To this our author replies, 1. That we have no reason to

think that the king knew that the works which he employed them to perform were within the reach of their art; but rather, on the contrary, he ordered them to try to perform them, that he might know whether art could effect them or not, or whether they were true miracles. 2. That it does not appear from the magicians here trying the experiments, and succeeding in them, that they thought at first their arts would be effectual; but, they would try all experiments in order to judge further of the matter; and, upon their attempting, God was pleased in some cases to give an unexpected success to their endeavours, in order to serve his purposes by it. For, 3. Their success was certainly unexpected, as evidently appears by their not being able to follow Moses in all his miracles. When they attempted to produce the lice, they could not do it. It is here evident the magicians did not know the extent of their powers, if they can be conceived to have had any: for they attempted to equal Moses in all his performances; but upon trial they found they could do some, whereas in others, though not a whit more difficult, they could not obtain any success at all. Had they had any effectual rules of art or science to work by, they would at first, without trial, have known what to attempt, and what not; but, in truth, they had no arts to perform any thing of this sort. In some instances, God was pleased to give a success, which they little expected, to their endeavours, and which they were so far from resting satisfied with, that they took the first opportunity which was given them, when their attempts failed, to acknowledge that Moses was certainly assisted by the divine power.

MAGISTRY, in chemistry, a name given to almost all precipitates. Thus, *magistry* and *precipitate* are synonymous; but lately, chemists have used chiefly the term *precipitate*, and applied that of *magistry* to some particular precipitates only, which are used in medicine and in the arts. Such are, the magisteries of bismuth, coal, crabs-eyes, sulphur, &c.

MAGISTRY of *Bismuth*. See CHEMISTRY, n° 209.

MAGISTRATE, any public officer, to whom the executive power of the law is committed either wholly or in part.

MAGLIABECCHI (Antony), a person of great learning, and remarkable for an amazing memory, was born at Florence in 1633. His father died when he was only seven years old. His mother had him taught grammar and drawing, and then put him apprentice to one of the best goldsmiths in Florence. When he was about 16 years old, his passion for learning began to shew itself; and he laid out all his money in buying books. Becoming acquainted with Michael Ermini, librarian to the cardinal de Medicis, he soon perfected himself by his assistance in the Latin tongue, and in a little time became master of the Hebrew. His name soon became famous among the learned. A prodigious memory was his distinguishing talent; and he retained not only the sense of what he had read, but frequently all the words, and the very manner of spelling. It is said that a gentleman, to make trial of the force of his memory, lent him a manuscript he was going to print. Some time after it was returned, the gentleman, coming to him with a melancholy countenance, pretended it was lost, and requested Magliabechi to recollect what he remembered of it; upon which

Shuckford's Connell. Vol. II. book ix. p. 411.

which he wrote the whole, without missing a word. He generally shut himself up the whole day, and opened his doors in the evening to the men of letters who came to converse with him. His attention was so absorbed by his studies, that he often forgot the most urgent wants of nature. Cosmo III. grand duke of Florence, made him his librarian; but he still continued negligent in his dress, and simple in his manners. An old cloak served him for a morning-gown in the day, and for bed-clothes at night. The duke, however, provided for him a commodious apartment in his palace, which he was with difficulty persuaded to take possession of; but which he quitted four months after, and returned to his house. He was remarkable for his extraordinary modesty, his sincerity, and his beneficence, which his friends often experienced in their wants. He was a patron of men of learning; and had the highest pleasure in assisting them with his advice and information, and in furnishing them with books and manuscripts. He had the utmost aversion at any thing that looked like constraint; and therefore the grand duke always dispensed with his personal attendance, and sent him his orders in writing. Though he lived a most sedentary life, he reached the 81st year of his age; and died in the midst of the public applause, after enjoying, during the latter part of his life, such assistance as few have ever procured by their learning. By his will, he left a very fine library to the public, with a fund for its support.

MAGNA ASSISE ELIGENDA, is a writ anciently directed to the sheriff for summoning four lawful knights before the justices of assize, in order to choose 12 knights of the neighbourhood, &c. to pass upon the great assize between such a person plaintiff and such a one defendant.

MAGNA Charta, the great charter of the liberties of Britain, and the basis of our laws and privileges.

This charter may be said to derive its origin from king Edward the Confessor, who granted several privileges to the church and state by charter: these liberties and privileges were also granted and confirmed by king Henry I. by a celebrated great charter now lost; but which was confirmed or re-enacted by king Henry II. and king John. Henry III. the successor of this last prince, after having caused 12 men make inquiry into the liberties of England in the reign of Henry I. granted a new charter; which was the same as the present magna charta. This he several times confirmed, and as often broke; till, in the 37th year of his reign, he went to Westminster-hall, and there, in presence of the nobility and bishops, who held lighted candles in their hands, magna charta was read, the king all the time holding his hand to his breast, and at last solemnly swearing faithfully and inviolably to observe all the things therein contained, &c. Then the bishops extinguishing the candles, and throwing them on the ground, they all cried out, "Thus let him be extinguished, and stink in hell, who violates this charter." It is observed, that, notwithstanding the solemnity of this confirmation, king Henry, the very next year, again invaded the rights of his people, till the barons entered into a war against him; when, after various success, he confirmed this charter, and the charter of the forest, in the 52d year of his reign.

This charter confirmed many liberties of the church, and redressed many grievances incident to feudal tenures, of no small moment at the time; tho' now, unless considered attentively and with this retrospect, they seem but of trifling concern. But, besides these feudal provisions, care was also taken therein to protect the subject against other oppressions, then frequently arising from unreasonable encroachments, from illegal distresses or other process for debts or services due to the crown, and from the tyrannical abuse of the prerogative of purveyance and pre-emption. It fixed the forfeiture of lands for felony in the same manner as it still remains; prohibited for the future the grants of exclusive fisheries; and the erection of new bridges so as to oppress the neighbourhood. With respect to private rights, it established the testamentary power of the subject over part of his personal estate, the rest being distributed among his wife and children; it laid down the law of dower, as it hath continued ever since; and prohibited the appeals of women, unless for the death of their husbands. In matters of public police and national concern, it enjoined an uniformity of weights and measures; gave new encouragements to commerce, by the protection of merchant-strangers; and forbade the alienation of lands in mortmain. With regard to the administration of justice: besides prohibiting all denials or delays of it, it fixed the court of common-pleas at Westminster, that the suitors might no longer be harassed with following the king's person in all his progresses; and at the same time brought the trial of issues home to the very doors of the freeholders, by directing assizes to be taken in the proper counties, and establishing annual circuits: it also corrected some abuses then incident to the trials by wager of law and of battle; directed the regular awarding of inquests for life or member; prohibited the king's inferior ministers from holding pleas of the crown, or trying any criminal charge, whereby many forfeitures might otherwise have unjustly accrued to the exchequer; and regulated the time and place of holding the inferior tribunals of justice, the county-court, sheriff's torn, and court-leet. It confirmed and established the liberties of the city of London, and all other cities, boroughs, towns, and ports of the kingdom. And lastly, (which alone would have merited the title that it bears, of the *great charter*) it protected every individual of the nation in the free enjoyment of his life, his liberty, and his property, unless declared to be forfeited by the judgment of his peers or the law of the land.

This excellent charter, so equitable, and beneficial to the subject, is the most ancient written law in the kingdom. By the 25th Edward I. it is ordained, that it shall be taken as the common law; and by the 43d Edward III. all statutes made against it are declared to be void.

MAGNESA, or MAGNESIA, (anc. geog.) a town or a district of Thessaly, at the foot of mount Pelius, called by Philip, the son of Demetrius, one of the three keys of Greece, (Pausanias).

MAGNESIA ALBA, a white earth procured from the mother-liquors of nitre, or sea-salt, by precipitation with a fixed alkali, and afterwards washing of the salt with water. See CHEMISTRY, n° 37.

Magnesia alba is a good absorbent; and undoubtedly

*Magnesia*. ly to be preferred to crab's-eyes, on account of its purgative quality when united with an acid, which the other has not. It has been esteemed hurtful in bilious habits where there is a disposition in the stomach contrary to acidity. This, however, according to Mr Henry, is doubtful: and where putrid bile is to be corrected, he thinks good purposes may be answered by taking magnesia with an acid in a state of effervescence; as the fixed air, thus extricated, will correct the putridity of the contents of the intestines, while they are at the same time evacuated downwards. He is also of opinion, that in cutaneous diseases it may enter the circulation in form of a neutral salt, and, by acting as a diaphoretic and diuretic, prove an excellent alterative.

For some medical purposes, magnesia is used in a calcined state; in which case it is deprived of its fixed air, and then it proves nearly as aperient as a double quantity of magnesia in its uncalcined state. Mr Henry is of opinion, that it may be useful in distensions of the bowels arising from flatul; that it may be successfully employed as a cathartic with patients labouring under the stone, who are using the lixivium saponeum; and that, joined with warm aromatics, it may be of service in correcting the great flatulency which so much afflicts people of a gouty disposition. From several experiments made by the same author, it also appears that magnesia has a considerable antiseptic power. The like virtue he ascribes to all kinds of testaceous powders: from whence he concludes, that medicines of this kind are by no means improper in fevers of a putrescent type; and that where bile is suspected to be the cause of any putrid disease, those antiseptics should be prescribed which particularly impede its corruption; that, as calcined magnesia is a more powerful antiseptic than most other absorbents, it merits a preference to these; and that where an acid cacochymy prevails, magnesia or other absorbents, taken immediately before or after meal-time, may, by increasing the putrefactive fermentation of animal-food, be of very great service. He hath also found, that magnesia hath a power of promoting the solution of resinous gums in water; and thus we have an elegant and easy method of preparing aqueous tinctures from these substances. Such tinctures, however, are calculated only for extemporaneous prescription, as most of them deposit a sediment when they have been kept a week or two.

*MAGNESIA*, (anc. geog.), a maritime district of Thessaly, lying between the fourth part of the Sinus Thermaticus and the Pagæus to the south, and to the east of the Pelagiotis. *Magnetes*, the people. *Magnæsus* and *Magnæssus*, the epithet, (Horace).

*MAGNESIA ad Meandrum*, (anc. geog.), a town of Ionia, on the Meander, to distinguish it from another Magnesia at the foot of mount Sipylus. The former was one of the three towns given to Themistocles by Artaxerxes, with these words, *to furnish his table with bread*. A colony from the Magnesia of Thessaly, (Pliny); from Delphi, (Athenæus); from Lacedæmon, (Velleius); distant 15 miles from Ephesus to the east, (Pliny). It did not stand immediately on the Meander, being nearer the river Letæus, which runs into the Meander, (Strabo). It is sometimes

mentioned without its distinguishing surname, as being more considerable than the other Magnesia, which is scarce ever without its surname *ad Sipylum*. *Magnetæ*, the people.

*MAGNESIA ad Sipylum*, (anc. geog.), anciently *Tantalus*, the residence of Tantalus, and capital of Mæonia, where now stands the lake Sale. A town of Lydia, at the foot of mount Sipylus, to the east of the Hermus; adjudged free under the Romans; destroyed by earthquakes. (Strabo).

*MAGNET*, *MAGNES*, the *Loadstone*; a sort of ferruginous stone, in weight and colour resembling iron ore, though somewhat harder and more heavy; endued with divers extraordinary properties, attractive, directive, inclinatory, &c. See *MAGNETISM*.

The magnet is also called *Lapis Heracleus*, from Heraclea, a city of Magnesia, a port of the ancient Lydia, where it is said to have been first found, and from which it is usually supposed to have taken its name. Though others derive the word from a shepherd named *Magnet*, who first discovered it with the iron of his crook on mount Ida. It is also called *Lapis nauticus*, by reason of its use in navigation; and *siderites*, from its attracting iron, which the Greeks call *sidêrôn*.

The magnet is usually found in iron mines, and sometimes in very large pieces, half magnet, half iron. Its colour is different, according to the different countries it is brought from. Norman observes, that the best are those brought from China and Bengal, which are of an iron or sanguine colour; those of Arabia are reddish; those of Macedonia blackish; and those of Hungary, Germany, England, &c. the colour of unwrought iron. Neither its figure nor bulk are determined, but it is found of all forms and sizes.

The ancients reckoned five kinds of magnets different in colour and virtue: the *Ethiopic*, *Magnesian*, *Boeotic*, *Alexandrian*, and *Natolian*. They also took it to be male and female: but the chief use they made of it was in medicine; especially for the cure of burns, and defluxions on the eyes.—The moderns, more happy, take it to conduct them in their voyages. See *NAVIGATION*.

The most distinguishing properties of the magnet are, That it attracts iron, and that it points to the poles of the world; and in other circumstances also dips or inclines to a point beneath the horizon, directly under the pole; and that it communicates these properties, by touch, to iron. On which foundation are built the mariner's needles, both horizontal, and inclinatory or dipping needles.

*Attractive Power of the MAGNET* was known to the ancients, and is mentioned even by Plato and Euripides, who call it the *Herculean stone*, because it commands iron, which subdues every thing else: but the knowledge of its directive power, whereby it disposes its poles along the meridian of every place, and occasions needles, pieces of iron, &c. touched with it, to point nearly north and south, is of a much later date; though the exact time of its discovery, and the discoverer himself, are yet in the dark. The first tidings we hear of it is in 1260, when Marco Polo the Venetian is said by some to have introduced the mariners compass; tho' not as an invention of his own, but as derived

ved from the Chinese, who are said to have had the use of it long before; tho' some imagine that the Chinese rather borrowed it from the Europeans.

Flavio de Gioia, a Neapolitan, who lived in the 13th century, is the person usually supposed to have the best title to the discovery: and yet Sir G. Wheeler mentions, that he had seen a book of astronomy much older, which supposed the use of the needle; though not as applied to the uses of navigation, but of astronomy. And in Guyot de Provins, an old French poet, who wrote about the year 1180, there is an express mention made of the loadstone and the compass; and their use in navigation obliquely hinted at.

*The Variation of the MAGNET*, or its declination from the pole, was first discovered by Seb. Cabot, a Venetian, in 1500; and the variation of that variation, by Mr Gellibrand, an Englishman, about the year 1625. See VARIATION.

Lastly, the dip or inclination of the needle, when at liberty to play vertically, to a point beneath the horizon, was first discovered by another of our countrymen, Mr R. Norman, about the year 1576. See the article *Dipping-NEEDLE*.

*Phænomena of the MAGNET.* 1°. In every magnet there are two poles, one whereof points northwards, the other southwards; and if the magnet be divided into ever so many pieces, the two poles will be found in each piece. The poles of a magnet are found by holding a very fine short needle over it; for where the poles are, the needle will stand upright, but nowhere else. 2°. These poles in different parts of the globe, are differently inclined towards a point under the horizon. 3°. These poles, though contrary to one another, do help mutually towards the magnet's attraction and suspension of iron. 4°. If two magnets be spherical, one will turn or conform itself to the other, so as either of them would do to the earth; and after they have so conformed or turned themselves, they endeavour to approach or join each other; but if placed in a contrary position, they avoid each other. 5°. If a magnet be cut through the axis, the parts or segments of the stone, which before were joined, will now avoid and fly each other. 6°. If the magnet be cut by a section perpendicular to its axis, the two points, which before were conjoined, will become contrary poles; one in one, the other in the other segment. 7°. Iron receives virtue from the magnet by application to it, or barely from an approach near it, though it do not touch it; and the iron receives this virtue variously, according to the parts of the stone it is made to touch, or even approach to. 8°. If an oblong piece of iron be any how applied to the stone, it receives virtue from it only as to its length. 9°. The magnet loses none of its own virtue by communicating any to the iron; and this virtue it can communicate to the iron very speedily: though the longer the iron touches or joins the stone, the longer will its communicated virtue hold; and a better magnet will communicate more of it, and sooner, than one not so good. 10°. Steel receives virtue from the magnet better than iron. 11°. A needle touched by a magnet will turn its ends the same way towards the poles of the world, as the magnet itself does. 12°. Neither loadstone nor needles touched by it do conform their poles exactly to those of the world, but have

usually some variation from them: and this variation is different in divers places, and at divers times in the same place. 13°. A loadstone will take up much more iron when armed or capped than it can alone. And though an iron ring or key be suspended by the loadstone, yet the magnetical particles do not hinder that ring or key from turning round any way, either to the right or left. A loadstone is said to be armed, when its poles are surrounded with plates of steel. To determine the quality of steel to be applied, try the magnet with several steel bars; and the greatest weight it takes up, with a bar on, is to be the weight of its armour. 14°. The force of a loadstone may be variously increased or lessened by the various application of iron, or another loadstone, to it. 15°. A strong magnet at the least distance from a lesser or a weaker, cannot draw to it a piece of iron adhering actually to such lesser or weaker stone; but if it come to touch it, it can draw it from the other: but a weaker magnet, or even a little piece of iron, can draw away or separate a piece of iron contiguous to a greater or stronger loadstone. 16°. In these northern parts of the world, the south pole of a loadstone will raise up more iron than the north pole. 17°. A plate of iron only, but no other body interposed, can impede the operation of the loadstone, either as to its attractive or directive quality. Mr Boyle found it true in glasses sealed hermetically; and glass is a body as impervious as most are to any effluvia. 18°. The power or virtue of a loadstone may be impaired by lying long in a wrong position, as also by rust, wet, &c. and may be quite destroyed by fire. 19°. A piece of iron-wire well touched, will, upon being bent round in a ring, or coiled round on a stick, &c. generally, quite lose its directive virtue, but always have it much diminished; and yet if the whole length of the wire were not entirely bent, so that the ends of it, though but for the length of one tenth of an inch, were left straight, the virtue will not be destroyed in those parts; though it will in all the rest. This was first observed by Grimaldi and de la Hire; and is confirmed by the experiments of Mr Derham; who adds further, that though coiling or bending the wire as above, would always destroy its virtue by day, yet it would not do it in the evening. 20°. This sphere of the activity of magnets is greater and less at different times: in particular, that reserved in the repository of the royal society will keep a key or other body suspended to another, sometimes, at the height of eight or ten feet; and at others, not above four feet. To which we may add, that the variation of the magnetical needle from the meridian, varies at various times of the day; as appears from some experiments of Mr Graham, and likewise from observations made during one of Capt Cook's voyages. See VARIATION. 21°. By twisting a piece of wire touched with a magnet, its virtue is exceedingly diminished; and sometimes so disordered and confused, that in some parts it will attract, and in others repel; and even, in some places, one side of the wire seems to be attracted, and the other side repelled, by one and the same pole of the stone. 22°. A piece of wire that has been touched, being split, or cleft in two, the poles are sometimes changed, as in a cleft magnet; the north becoming the south, and the south the north: and yet

some-

**Magnet.** sometimes one half of the wire will retain its former poles, and the other half will have them changed. To which it may be added, that laying one or other side of the half uppermost, causes a great alteration in its tendency or aversion to the poles of the magnet. 23°. A wire being touched from end to end with the same pole of the magnet, the end whereat you begin will always turn contrary to the pole which touched it: if it be again touched the same way with the other pole of the magnet, it will then be turned the contrary way. 24°. If a piece of wire be touched in the middle with only one pole of the magnet, without moving it backwards or forwards; in that place will be the pole of the wire, and the two ends will be the other pole. 25°. If a magnet be heated red hot, and again cooled either with its south pole towards the north in a horizontal position, or with its south pole downwards in a perpendicular position, its poles will be changed. 26°. Mr Boyle (to whom we are indebted for the following magnetical phenomena) found he could presently change the poles of a small fragment of a loadstone, by applying them to the opposite vigorous ones of a large magnet. 27°. Hard iron tools well tempered, when heated by a brisk attrition, as filing, turning, &c. will attract thin filings or chips of iron, steel, &c. and hence we observe files, punches, augers, &c. to have a small degree of magnetic virtue. 28°. The iron-bars of windows, &c. which have a long time stood in an erect position, grow permanently magnetical; the lower ends of such bars being the north-pole, and the upper the southern. 29°. A bar of iron that has not stood long in an erect posture, if it be only held perpendicularly, will become magnetical, and its lower end the north pole, as appears from its attracting the south pole of a needle: but then this virtue is transient, and by inverting the bar the poles will shift their places. In order therefore to render the quality permanent in an iron bar, it must continue a long time in a proper position. But the fire will produce the effect in a short time: for as it will immediately deprive a loadstone of its attractive virtue; so it soon gives a verticity to a bar of iron, if, being heated red hot, it be cooled in an erect posture, or directly north and south. Nay, tongs and fire-forks, by being often heated and set to cool again in a posture nearly erect, have gained this magnetical property. Sometimes iron bars, by long standing in a perpendicular position, have acquired the magnetic virtue in a surprising degree. A bar about 10 feet long, and three inches thick, supporting the summer-beam of a room, was able to turn the needle at eight or ten feet distance, and exceeded a loadstone of three and an half pounds weight. From the middle point upwards it was a north pole, and downwards a south pole; and Mr Martin mentions a bar, which had been the beam of a large steel-yard, that had several poles in it. 30°. Mr Boyle found, that by heating a piece of English oker red-hot, and placing it to cool in a proper posture, it manifestly acquired a magnetic virtue. And an excellent magnet of the same ingenious gentleman's having lain near a year in an inconvenient posture, had its virtue surprisingly impaired, as if it had been by fire. 31°. A needle well touched, it is known, will point north and south: if it have one contrary touch of the same stone, it will be deprived of its faculty; and by another such touch will have its poles quite changed. 32°. If a bar of iron have gained a verticity by being heated red-hot and cooled again, north and south, and then hammered at the two ends; its virtue will be destroyed by two or three smart blows on the middle. 33°. By drawing the back of a knife, or long piece of steel-wire, &c. leisurely over the pole of a loadstone; carrying the motion from the middle of the stone to the pole, the knife or wire will accordingly attract one end of a needle; but if the knife or wire be passed from the said pole to the middle of the stone, it will repel that end of the needle which in the other case it attracts. 34°. Either a magnet or a piece of iron being laid on a piece of cork, so as to swim freely in water; it will be found, that, whichever of the two is held in the hand, the other will be drawn to it: so that iron attracts the magnet as much as it is attracted by it; action and re-action being always equal. In this experiment, if the magnet be set afloat, it will direct its two poles to the poles of the world. 35°. A knife, &c. touched with a magnet, acquires a greater or less degree of virtue, according to the part it is touched on. It receives the strongest touch, when it is drawn leisurely from the handle towards the point over one of the poles: And if the same knife thus touched, and thus in possession of a strong attractive power, be retouched in a contrary direction, viz. by drawing it from the point towards the handle over the same pole, it immediately loses all its virtue. 36°. A magnet ads with equal force *in vacuo* and in the open air. 37°. The smallest magnets have generally the greatest power in proportion to their bulk. A large magnet will seldom take up above three or four times its own weight, whereas a small one will frequently take up more than ten times its weight. A magnet worn by Sir Isaac Newton in a ring, and which weighed only three grains, would take up 746 grains, or almost 250 times its own weight. A magnetic bar made by Mr Canton, according to the method described in the next article, and which weighed 10 ounces 12 penny-weights, took up something more than 79 ounces; and a flat semicircular steel magnet that weighed an ounce and 13 penny-weights took up an iron wedge of 90 ounces.

**Artificial MAGNET**, is a term usually applied to steel bars impregnated with the virtues of the natural magnet or loadstone; and are much more common, as well as more convenient for use, than the others.

The late Dr Godwin Knight possessed a surprising skill in magnetism, being able to communicate an extraordinary degree of attractive or repulsive virtue, and to alter or reverse the poles at pleasure; but as he refused to discover his methods upon any terms whatever, (even, as he said, though he should receive in return as many guineas as he could carry) these curious and valuable secrets have died with him. In the 69th volume of the Philosophical Transactions, however, Mr Benjamin Wilson hath given a process which at least discovers one of the leading principles of Dr Knight's art, and may perhaps be a means of discovering the whole to those who shall be less reserved. The doctor's process, according to Mr Wilson, was as follows. Having provided himself with a great quantity of clean iron-filings, he put them into a large tub that was more than one third filled with

**Magnet.** clean water; he then, with great labour, worked the tub and fro for many hours together, that the friction between the grains of iron by this treatment might break off such smaller parts as would remain suspended in the water for a time. The obtaining of these very small particles in sufficient quantity seemed to him to be one of the principal desiderata in the experiment. The water being by this treatment rendered very muddy, he poured the same into a clean iron vessel, leaving the filings behind; and when the water had stood long enough to become clear, he poured it out carefully, without disturbing such of the sediment as still remained, which now appeared reduced almost to impalpable powder. This powder was afterwards removed into another vessel in order to dry it; but as he had not obtained a proper quantity thereof by this one step, he was obliged to repeat the process many times. Having at last procured enough of this very fine powder, the next thing was to make a paste of it, and that with some vehicle which would contain a considerable quantity of the phlogistic principle: for this purpose, he had recourse to linseed oil in preference to all other fluids. With these two ingredients only he made a stiff paste, and took particular care to knead it well before he moulded it into convenient shapes. Sometimes, while the paste continued in its soft state, he would put the impression of a seal upon the several pieces; one of which is in the British museum. This paste was then put upon wood, and sometimes on tiles, in order to bake or dry it before a moderate fire, at about the distance of a foot or thereabouts. He found that a moderate fire was most proper, because a greater degree of heat made the composition frequently crack in many places. The time required for the baking or drying of this paste was generally about five or six hours before it attained a sufficient degree of hardness. When that was done, and the several baked pieces were become cold, he gave them their magnetic virtue in any direction he pleased, by placing them between the extreme ends of his large magazine of artificial magnets for a few seconds or more, as he saw occasion. By this method the virtue they acquired was such, that, when any of those pieces were held between two of his best tea-guinea bars, with its poles purposely inverted, it immediately of itself turned about to recover its natural direction, which the force of those very powerful bars was not sufficient to counteract.

As to the method of making artificial magnets of steel, none hath succeeded in it better than Mr Canton, whose process is as follows.

Procure a dozen of bars; six of soft steel, each three inches long, one quarter of an inch broad, and one twentieth of an inch thick; with two pieces of iron, each half the length of one of the bars, but of the same breadth and thickness; also six pieces of hard steel, each five inches and a half long, half an inch broad, and three-twentieths of an inch thick; with two pieces of iron of half the length, but the whole breadth and thickness of one of the hard bars; and let all the bars be marked with a line quite round them at one end. Then take an iron poker and tongs, (fig. 1.) or two bars of iron, the larger they are and the longer they have been used, the better; and fixing the poker upright between the knees, hold to it, near the top, one of the soft bars, having its marked end down-

wards, by a piece of sewing silk, which must be pulled tight by the left hand, that the bar may not slide; then grasping the tongs with the right hand, a little below the middle, and holding them nearly in a vertical position, let the bar be stroked by the lower end from the bottom to the top, about ten times on each side, which will give it a magnetic power sufficient to lift a small key at the marked end: which end, if the bar was suspended on a point, would turn towards the north, and is therefore called the *north pole*; and the unmarked end is, for the same reason, called the *south pole*. Four of the soft bars being impregnated after this manner, lay the two (fig. 2.) parallel to each other, at the distance of one fourth of an inch, between the two pieces of iron belonging to them, a north and a south pole against each piece of iron: then take two of the four bars already made magnetical, and place them together so as to make a double bar in thickness, the north pole of one even with the south pole of the other; and the remaining two being put to these, one on each side, so as to have two north and two south poles together; separate the north from the south poles at one end by a large pin, and place them perpendicularly with that end downward on the middle of one of the parallel bars, the two north poles towards its south, and the two south poles towards its north end: slide them backward and forward three or four times the whole length of the bar, and removing them from the middle of this, place them on the middle of the other bar as before directed, and go over that in the same manner; then turn both the bars the other side upwards, and repeat the former operation: this being done, take the two from between the pieces of iron; and, placing the two outermost of the touching bars in their room, let the other two be the outermost of the four to touch these with; and this process being repeated till each pair of bars have been touched three or four times over, which will give them a considerable magnetic power, put the half-dozen together after the manner of the four, (fig. 3.) and touch them with two pair of the hard bars placed between their irons, at the distance of about half an inch from each other; then lay the soft bars aside, and with the four-hard ones let the other two be impregnated (fig. 4.), holding the touching bars apart at the lower end near two tenths of an inch; to which distance let them be separated after they are set on the parallel bar, and brought together again before they are taken off: this being observed, proceed according to the method described above, till each pair have been touched two or three times over. But as this vertical way of touching a bar will not give it quite so much of the magnetic virtue as it will receive, let each pair be now touched once or twice over in their parallel position between the irons (fig. 5.), with two of the bars held horizontally, or nearly so, by drawing at the same time the north of one from the middle over the south end, and the south of the other from the middle over the north end of a parallel bar; then bringing them to the middle again, without touching the parallel bar, give three or four of these horizontal strokes to each side. The horizontal touch, after the vertical, will make the bars as strong as they possibly can be made, as appears by their not receiving any additional strength, when the vertical touch is given by a great number of bars, and

**Magnet.**

**Magnetism.** the horizontal by those of a superior magnetic power. This whole process may be gone through in about half an hour; and each of the large bars, if well hardened, may be made to lift 28 Troy ounces, and sometimes more. And when these bars are thus impregnated, they will give to an hard bar of the same size its full virtue in less than two minutes; and therefore will answer all the purposes of magnetism in navigation and experimental philosophy much better than the loadstone, which is known not to have a sufficient power to impregnate hard bars. The half dozen being put into a case (fig. 6.), in such a manner as that Magnetism

## M A G N E T I S M,

**T**HE quality or constitution of a body, and its pores, whereby it is rendered magnetical, or a magnet. See **MAGNET**.

Magnetism is found to be a transient power, capable of being produced and destroyed again.

### SECT. I. *The Laws of Magnetism.*

THE laws of magnetism are laid down by Mr Whiston in the following propositions.—1°. The loadstone has both an attractive and a directive power united together, whereby iron touched by it has only the former; i. e. the magnet not only attracts needles or filings of steel, but directs them to certain different angles with respect to its own surface and axis: whereas iron touched with it, does little or nothing more than attract them; still suffering them to lie along or stand perpendicular to its surface and edges in all places, without any such special direction.

2°. Neither the strongest nor the large magnets give a better directive touch to needles than those of a less size or virtue: to which it may be added, that whereas there are two qualities in all magnets, an attractive and a directive one; neither of them depend on, or are any argument of, the strength of the other.

3°. The attractive power of magnets, and of iron, will greatly increase or diminish the weight of needles on the balance; nay, will overcome that weight, and sustain other additional weights too: while the directive power has much smaller effect. Gassendus indeed, as well as Mesfennus and Dr Gilbert, maintain it has none at all: but mistakenly; for Mr Whiston found, from repeated trials on large needles, that after the touch they weighed less than before. One of 4584½ grains lost 2½ grains by the touch; and another of 65726 grains weight, no less than 14 grains.

4°. It is probable that iron consists almost wholly of the attractive particles; and the magnet, of the attractive and directive together: mixed, probably, together with other heterogeneous matter; as having never been purged by the fire, which iron has: and hence may arise the reason why iron, after it has been touched, will lift up much greater weights than the loadstone that touched it.

5°. The quantity and direction of magnetic powers, communicated to needles, is not properly, after such communication, owing to the magnet which gave the touch; but to the goodness of the steel which receives it, and to the strength and position of the terrestrial loadstone, whose influence alone those needles are af-

terwards subject to, and directed by: so that all such needles, if good, move with the same strength and point to the same angle; what loadstone soever (provided it be good) they were excited by. Nor does the touch seem to do much more in magnetical, than attrition in electrical cases; i. e. it serves to rub off some obstructing particles, that adhere to the surface of the steel, and open the pores of the bodies touched, and so make way for the entrance and exit of such effluvia as occasion or assist the powers we are speaking of. Hence Mr Whiston takes occasion to observe, that the directive power of the loadstone seems to be mechanical; and to be derived from magnetic effluvia, circulating continually round it.

6°. The absolute attractive power of different armed loadstones, is, *ceteris paribus*, according to the quantity, not of their diameters or solidities, but of the surfaces of the loadstones, or in a duplicate proportion of their diameters.

7°. The power of good magnets unarmed, not sensibly different in strength, similar in figure and position, but unequal in magnitude, is sometimes a little greater, sometimes a little less, than in the proportion of their similar diameters.

8°. The loadstone attracts needles that have been touched, and others that have not been touched, with equal force, at distances unequal, viz. where the distances are to one another as 5 to 2.

9°. Both poles of a loadstone equally attract needles, till they be thoroughly touched: then it is, and then only, that one pole begins to attract one end, and repel the other; though the repelling pole will still attract upon contact, nay at very small distances, notwithstanding.

10°. The attractive power of loadstones, in their similar position too, but different distances from magnetic needles, is in the sesquiduplicate proportion of the distances of their surfaces from their needles reciprocally, or as the mean proportionals between the squares and the cubes of those distances reciprocally, or as the square roots of the fifth powers of those distances reciprocally. Thus the magnetic power of attraction, at twice the distance from the surface of the loadstone, is between a fifth and sixth part of that power at the first distance. At thrice the distance, the power is between the 15th and 16th part; at four times the distance, the power 32 times as small; and at six times the distance, 88 times as small. Where it is to be noted, that the distances are not taken, as in the law of gravity, from the centre, but from the surface; all experience assuring us, that the

the magnetic power resides chiefly, if not wholly, in the surface of the loadstones and iron, without any particular relation to centre at all. The proportion here laid down was determined by Mr Whiston, from a great number of experiments of Mr Haukbee, Dr Brook Taylor, and himself; measuring the force by the chords of those arcs by which the magnet at several distances draws the needle out of its natural direction, to which chords (as he has demonstrated) it is ever proportional. The numbers in some of their most accurate trials lie gives us in the following table, setting down half the chords, or the sines of half those arcs of declination, as the true measures of the power of magnetism.

Distances in inches.	Degrees of inclination.	Sines of $\frac{1}{2}$ arcs.	Rat. $\frac{sc}{qu}$ dupl.
20	— 2	— 175	— 466
14 $\frac{1}{2}$	— 4	— 349	— 216
13 $\frac{1}{2}$	— 6	— 523	— 170
12	— 8	— 697	— 138
11 $\frac{1}{2}$	— 10	— 871	— 105
10 $\frac{1}{2}$	— 12	— 1045	— 87
9 $\frac{1}{2}$	— 14	— 1219	— 70

11°. An inclinatory, or dipping-needle, of six inches radius, and of a prismatic or cylindric figure, when it oscillates along the magnetic meridian, performs here every mean vibration in about 6" or 360"; and every small oscillation in about 5"  $\frac{1}{2}$ , or 330"; and the same kind of needle, four feet long, makes every mean oscillation in about 24", and every small one in about 22".

12°. The entire power of magnetism in this contrivance, as it affects needles a foot long, is to that of gravity nearly as 1 to 300; and as it affects needles four feet long, as 1 to 600.

13°. The quantity of magnetic power accelerating the same dipping-needle, as it oscillates in different vertical planes, is ever as the sines of the angles made by those planes; and the magnetic meridian, taken on the horizon.

Thus if we would estimate the quantity of forces in the horizontal and vertical situations of needles at London; we shall find that the latter, in needles a foot long, is to the entire force along the magnetic meridian as 96 to 100; and in needles four feet long, as 9667 to 10,000; whereas, in the former, the entire force in needles a foot long, is as 28 to 100; and in those four feet long, as 2560 to 10,000. Whence it follows, that the power by which horizontal needles are governed in these parts of the world is but one quarter of the power by which the dipping-needle is moved.

Hence also, since the horizontal needle is moved only by a part of the power which moves the dipping-needle; and that it only points to a certain place in the horizon, because that place is the nearest its original tendency of any its situation will allow it to tend to: whenever the dipping-needle stands exactly perpendicular to the horizon, the horizontal needle will not respect one point of the compass more than another, but will wheel about every way uncertainly.

14°. The time of oscillation and vibration, both in dipping and horizontal needles equally good, is as their length directly; and the actual velocity of their

points along their arcs always equal. Hence magnetic needles are, *ceteris paribus*, still better the longer they are; and that in the same proportion with their lengths.

The law of magnetic attraction is not yet ascertained. Sir Isaac Newton supposes it to decrease nearly in the triplicate ratio of the distance: but Dr Hellham, trying the experiment by his loadstone, found it to be as the squares of the distances inversely; and Mr Martin assures us, that the power of his loadstone decreases in a different manner from either, it being in the sesquiplicate ratio of the distances inversely. For exactness, he made a square bar of iron just a quarter of an inch thick, and then provided three pieces of wood of the same form and thickness exactly; then positing the loadstone very nicely at the end of a balance, which would turn with less than a grain, he placed under it the iron with first one piece of wood, then two pieces, and lastly all three pieces upon it: by which means the steel points of the pole were kept at  $\frac{1}{4}$ ,  $\frac{1}{2}$ ,  $\frac{3}{4}$ , of an inch from the iron; and in those distances the weights put into the opposite scale, to raise the loadstone from the wood, which is touched while the beam was horizontal, were as follows:

	Grains.	Rat. of sq.	Rat. of cub.	S. rat.
Distances. $\left\{ \begin{array}{l} \frac{1}{4} \\ \frac{1}{2} \\ \frac{3}{4} \end{array} \right.$	156	156	56	156
	50	39	19	56
	28	17	6	30

Whence it appears, that the number of grains to counteract the power of the loadstone in these distances, approach very near, and are almost the same with those which are in the sesquiplicate ratio, but are widely different from those which are in the duplicate ratio; and this experiment Mr Martin tried several times for each distance, with scarce any variation in the success.

The ingenious Muschenbroeck has, with indefatigable pains and application, made experiments of the attractions and repulsions of loadstones in respect to iron and to each other; but could never find any regular proportion in the increase of attraction in their approach to, or decrease of attraction in their recess from, one another: only that the force of the magnetic virtue did increase in the approach to, and diminish in the recess from the stone, but not exactly as the distance, nor as the square or cube of the distance, nor as the square or cube of the distance reciprocally, nor in any proportion reducible to numbers; and therefore he conjectures, that the repulsions and attractions disturb one another, so as to confound the proportion.

## SECT. II. Of the Causes of Magnetism.

WITH respect to the causes of magnetism, nothing hath hitherto appeared that can be called a satisfactory solution of its phenomena. It is certain indeed, that both natural and artificial electricity will give polarity to needles, and even reverse their poles; but though from this it may appear probable that the electric fluid is also the cause of magnetism, yet in what manner the fluid acts while producing the magnetical phenomena seems to be totally unknown. All that hath been discovered with regard to this matter is, that a shock from a jar moderately charged, sent from end to end through a fine needle, will give

it a polarity. If the needle is reversed, and a similar shock sent through it the contrary way, the polarity will be destroyed; a third shock will reverse the poles; and the same thing is done by a second shock, if much stronger than the first. If the shock is sent through the sides of the needle, its ends will point east and west; the reason of which is, that one side of it is become a north, and the other a south pole. Most authors agree, that the end at which the electric blast enters becomes the north-pole; but, from some experiments, this seems very doubtful. The degree of magnetic virtue which electricity can communicate, is very far from being ascertained.

The direction of the magnetic effluvia is thought to be shown by the following experiment. Let AB, CD, (fig. 7.) be the poles of a magnet. Round every side lightly strew steel filings, on a sheet of white paper; the particles of the filings will be so affected by the effluvia of the stone, as to show the course they take every way. In the middle of each pole, between AB and CD, they appear to proceed in lines nearly straight; towards the ends, they are more and more curved; till at last the lines from both sides, coinciding with each other, form numberless curves round the stone, which are nearly of a circular figure, as in the plate. Hence it is inferred that the magnetic effluvia, issuing from one pole, circulates to the other.

### SECT. III. Entertaining Experiments.

CONSTRUCTION OF THE MAGNETIC PERSPECTIVE-GLASS.] Provide an ivory tube, about two inches and a half long, and of the form expressed in fig. 8. The sides of this tube must be thin enough to admit a considerable quantity of light. It is to open at one end with a screw: at that end there must be placed an eye-glass A of about two inches focus, and at the other end any glass you please. Have a small magnetic needle, like that placed on a compass. It must be strongly touched, and so placed at the bottom of the tube that it may turn freely round. It is to be fixed on the centre of a small ivory circle C, of the thickness of a counter, which is placed on the object-glass D, and painted black on the side next it. This circle must be kept fast by a circular rim of pasteboard, that the needle may not rise off its pivot, after the same manner as in the compass. This tube will thus become a compass, sufficiently transparent to show the motions of the needle. The eye-glass serves more clearly to distinguish the direction of the needle; and the glass at the other end, merely to give the tube the appearance of a common perspective. It will appear from the laws of magnetism already laid down, that the needle in this tube, when placed over, and at a small distance from, a magnet, or any machine in which it is contained, will necessarily place itself in a position directed by that magnet, and consequently show where the north and south pole of it is placed; the north end of the needle constantly pointing to the south end of the magnet. This effect will take place, though the magnet be inclosed in a case of wood, or even metal, as the magnetic effluvia penetrates all bodies. You must observe, however, that the attracting magnet must not be very far distant from the needle, especially if it be small, as in that

case its influence extends but to a short distance. This tube may be differently constructed, by placing the needle in a perpendicular direction, on a small axis of iron, on which it must turn quite freely, between two small plates of brass placed on each side the tube: the two ends of the needle should be in exact equilibrium. The north and south ends of this needle will, in like manner, be attracted by the south and north ends of the magnetic bar. The former construction, however, appears preferable, as it is more easily excited, and the situation of the needle much more easily distinguished.

#### EXPER. 1. The communicative crown.

TAKE a crown-piece, and bore a hole in the side of it; in which place a piece of wire, or a large needle, well polished, and strongly touched with a magnet. Then close the hole with a small piece of pewter, that it may not be perceived. Now the needle in the magnetic perspective before described, when it is brought near to this piece of money, will fix itself in a direction correspondent to the wire or needle in that piece. Desire any person to lend you a crown-piece, which you dextrously change for one that you have prepared as above. Then give the latter piece to another person, and leave him at liberty either to put it privately in a snuff-box, or not; he is then to place the box on a table, and you are to tell him, by means of your glass, if the crown is or is not in the box. Then bringing your perspective close to the box, you will know, by the motion of the needle, whether it be there or not; for as the needle in the perspective will always keep to the north of itself, if you do not perceive it has any motion, you conclude the crown is not in the box. It may happen, however, that the wire in the crown may be placed to the north, in which case you will be deceived. Therefore, to be sure of success, when you find the needle in the perspective remain stationary, you may make some pretence to desire the person to move the box into another position, by which you will certainly know if the crown-piece be there nor not.—You must remember, that the needle in the perspective must here be very sensible, as the wire in the crown cannot possibly have any great attractive force.

#### 2. The magnetic table.

UNDER the top of a common table place a magnet that turns on a pivot; and fix a board under it, that nothing may appear. There may also be a drawer under the table, which you pull out to show that there is nothing concealed. At one end of the table there must be a pin that communicates with the magnet, and by which it may be placed in different positions: this pin must be so placed as not to be visible to the spectators. Strew some steel filings or very small nails over that part of the table where the magnet is. Then ask any one to lend you a knife, or a key, which will then attract part of the nails or filings. Then placing your hand in a careless manner on the pin at the end of the table, you alter the position of the magnet; and giving the key to any person, you desire him to make the experiment, which he will then not be able to perform. You then give the key to another person; at the same time placing the magnet,

Entertain-  
ing Experi-  
ments.

by means of the pin, in the first position, when that person will immediately perform the experiment.

### 3. *The mysterious watch.*

You desire any person to lend you his watch, and ask him if he thinks it will or will not go when it is laid on the table. If he say it will, you place it over the end of the magnet, and it will presently stop (A). You then mark with chalk, or a pencil, the precise point where you placed the watch; and moving the position of the magnet, as in the last experiment, you give the watch to another person, and desire him to make the experiment; in which he not succeeding, you give it to a third person, at the same time replacing the magnet, and he will immediately perform the experiment.

### 4. *The magnetic dial.*

Provide a circle of wood or ivory, of about five or six inches diameter, as fig. 9. which must turn quite free on the stand B (fig. 10.) in the circular border A: on the circle must be placed the dial of pasteboard C (fig. 9.), whose circumference is to be divided into 12 equal parts, in which must be inscribed the numbers from 1 to 12, as on a common dial. There must be a small groove in the circular frame D, to receive the pasteboard circle: and observe, that the dial must be made to turn so free, that it may go round without moving the circular border in which it is placed. Between the pasteboard circle and the bottom of the frame, place a small artificial magnet E, (fig. 11.) that has a hole in its middle, or a small protuberance. On the outside of the frame place a small pin F, which serves to show where the magnetic needle I, that is placed on a pivot at the centre of the dial, is to stop. This needle must turn quite free on its pivot, and its two sides should be in exact equilibrium. Then provide a small bag, that has five or six divisions, like a lady's work-bag, but smaller. In one of these divisions put small square pieces of pasteboard, on which are wrote the numbers from 1 to 12, and if you please you may put several of each number. In each of the other divisions you must put 12 or more like pieces; observing, that all the pieces in each division must be marked with the same number. Now the needle being placed upon its pivot, and turned quickly about, it will necessarily stop at that point where the north end of the magnetic bar is placed, and which you previously know by the situation of the small pin in the circular border. You therefore present to any person that division of the bag which contains the several pieces on which is wrote the number opposite to the north end of the bar, and tell him to draw any one of them he pleases. Then placing the needle on the pivot, you turn it quickly about, and it will necessarily stop, as we have already said, at that particular number.

Another experiment may be made with the same dial, by desiring two persons to draw each of them one number out of two different divisions of the bag; and if their numbers, when added together, exceed 12, the needle or index will stop at the number they exceed it; but if they do not amount to 12, the index will stop at the sum of those two numbers. In order

to perform this experiment, you must place the pin against the number 5, if the two numbers to be drawn from the bag be 10 and 7; or against 9, if they be 7 and 2.—If this experiment be made immediately after the former, as it easily may, by dexterously moving the pin, it will appear the more extraordinary.

### 5. *The dexterous painter.*

Provide two small boxes, as M and N (fig. 12.), four inches wide, and four inches and a half long. Let the box M be half an inch deep, and N two-thirds of an inch. They must both open with hinges, and shut with a clasp. Have four small pieces of light wood, (fig. 13, 14, 15, 16.) of the same size with the inside of the box M (fig. 12.), and about one third of an inch thick. In each of these let there be a groove, as AB, EF, CD, GH: these grooves must be in the middle, and parallel to two of the sides. In each of these grooves place a strong artificial magnet, as fig. 17. The poles of these magnets must be properly disposed with regard to the figures that are to be painted on the boards; as is expressed in the plate. Cover the bars with paper, to prevent their being seen; but take care, in passing it on, not to wet the bars, as they will thereby rust, which will considerably impair their virtue. When you have painted such subjects as you choose, you may cover them with a very thin clear glass. At the centre of the box N, place a pivot (fig. 18.), on which a small circle of pasteboard OPQR (fig. 19.) is to turn quite free; under which is to be a touched needle S. Divide this circle into four parts, which are to be disposed with regard to the poles of the needle, as is expressed in the figure. In these four divisions you are to paint the like subjects as are on the four boards, but reduced to a smaller compass. Cover the inside of the top of this box with a paper M, (see fig. 12.), in which must be an opening D, at about half an inch from the centre of the box, that you may perceive, successfully, the four small pictures on the pasteboard circle just mentioned. This opening is to serve as the cloth on which the little painter is supposed to draw one of the pictures. You may cover the top of the box, if you please, with a thin glass. Then give the first box to any person, and tell him to place any one of the four pictures in it privately, and when he has closed it, to give it you. You then place the other box over it; when the moveable circle, with the needle, will turn till it comes in the same position with the bar in the first box. It will then appear that the little dexterous painter has already copied the picture that is inclosed in the first box.

### 6. *The cylindric oracle.*

Provide a hollow cylinder of about six inches high plate and three wide, as AB. Its cover CD must be made to fix on any way. On one side of this box or cylinder, let there be a groove, nearly of the same length with that side; in which place a small steel bar (fig. 2.) that is strongly impregnated, with the north pole next the bottom of the cylinder. On the upper side of the cover describe a circle; and divide it into ten equal parts, in which are to be wrote the numbers from 1 to 10, as is expressed in fig. 3. Place a pivot at the

(A) To perform this experiment, you must use a strong magnetic bar; and the balance of the watch must not be of b but steel.

Entertain-  
ing  
Experi-  
ments.

Entertain-  
ing  
Experi-  
ments.

the centre of this circle, and have ready a magnetic needle. You are then to provide a bag, in which there are several divisions, like that described in exper. 4. In each of these divisions put a number of papers, on which the same or similar questions are wrote. In the cylinder put several different answers to each question, and seal them up in the manner of small letters. On each of these letters or answers is to be wrote one of the numbers of the dial or circle at the top of the box. You are supposed to know the number of the answers to each question. You then offer one of the divisions of the bag, observing which division it is; to any person, and desire him to draw one of the papers. Next put the top on the cylinder, with that number which is wrote on the answer directly over the bar. Then placing the needle on the pivot, you turn it briskly about, and it will naturally stop at the number over the bar. You then desire the person who drew the question to observe the number at which the needle stands, and to search in the box for a paper with the same number, which he will find to contain the answer.—You may repeat the experiment by offering another division of the bag to the same or another person; and placing the number that corresponds to the answer over the magnetic bar, proceed as before.

It is easy to conceive of several answers to the same question. For example, suppose the question to be, Is it proper to marry?

Answer 1. While you are young not yet, when you are old not at all.

2. Marry in haste, and repent at leisure.

3. Yes, if you can get a good fortune; for something has some favour, but nothing has no favour.

4. No, if you are apt to be out of humour with yourself; for then you will have two persons to quarrel with.

5. Yes, if you are sure to get a good husband (wife); for that is the greatest blessing of life. But take care you are sure.

6. No, if the person you would marry is an angel; unless you will be content to live with a devil.

#### 7. The enchanted ewer.

Fix a common ewer, as A, (fig. 4.) of about 12 inches high, upon a square stand BC; in one side of which there must be a drawer D, of about four inches square and half an inch deep. In the ewer place a hollow tin cone, inverted, as AB, fig. 5. of about four inches and a half diameter at top, and two inches at bottom; and at the bottom of the ewer there must likewise be a hole of two inches diameter.

Upon the stand, at about an inch distance from the bottom of the ewer, and directly under the hole, place a small convex mirror H, of such convexity that a person's visage, when viewed in it, at about 15 inches distance, may not appear above two inches and a half long.

Upon the stand likewise, at the point I, fig. 2. place a pivot of half an inch high, on which must be fixed a touched needle RQ, inclosed in a circle of very thin pasteboard OS, fig. 6. of five inches diameter. Divide this pasteboard into four parts, in each of which draw a small circle; and in three of these circles paint a head as x, y, z, the dress of each of which is to be dif-

ferent, one, for example, having a turban, another a hat, and the other a woman's cap. Let that part which contains the face in each picture be cut out, and let the fourth circle be entirely cut out; as it is expressed in the figure. You must observe, that the poles of the needle are to be disposed in the same manner as in the plate.

You are next to provide four small frames of wood or pasteboard, n° 1. 2. 3. 4. each of the same size with the inside of the drawer. On these frames must be painted the same figures as on the circular pasteboards; with this difference, that there must be no part of them cut out. Behind each of these pictures place a magnetic bar, in the same direction as is expressed in the plate; and cover them over with paper, that they may not be visible. Matters being thus prepared, you first place in the drawer the frame n° 4. on which there is nothing painted. You then pour a small quantity of water into the ewer, and desire the company to look into it, asking them if they see their own figures as they are. Then you take out the frame n° 4. and give the three others to any one, desiring him to choose in which of those dresses he would appear. Then put the frame with the dress he has chose in the drawer; and a moment after, the person looking into the ewer will see his own face surrounded with the dress of that picture. For, the pasteboard circle (divided, as above described, into four parts, in three of which are painted the same figures as on three of the boards, and the fourth left blank) containing a magnetic needle, and the four boards having each a concealed magnet; therefore, when one of them is put in the drawer under the ewer, the circle will correspond to the position of that magnet, and consequently the person looking into the top of the ewer will see his own face surrounded with the head-dress of the figure in the drawer.—This experiment, well performed, is highly agreeable. As the pasteboard circle can contain only three heads, you may have several such circles, but you must then have several other frames; and the ewer must be made to take off from the stand.

#### 8. The box of metals.

Provide a wooden box, about thirteen inches long and seven wide, as ABCD (fig. 7.). The cover of this box should be as thin as possible. Have six small boxes or tablets, about an inch deep, all of the same size and form, as EFGHIK, that they may indiscriminately go into similar holes made in the bottom of the large box. In each of these tablets is to be placed a small magnetic ball, and their poles are to be disposed as expressed in the figure. Cover each of these tablets with a thin plate of one of the six following metals, viz. gold, silver, copper, iron, pewter, and lead. You must also have a magnetic perspective, at the end of which is to be two circles, one divided into six equal parts, and the other into four, as in fig. 8. from the centre of which there must be drawn an index N, whose point is to be placed to the north. Therefore, when you are on the side CD of the box, and hold your perspective over any one of the tablets that are placed on the holes E, F, G, so that the index drawn on the circle is perpendicular to the side AB, the needle in the perspective will have its south pole directed to the letter that denotes the metal contained in that

Plate  
CLXIV.

ing  
Experi-  
ments.

Plate  
CLXIV.

that tablet. When you hold the perspective over one of the boxes placed in the holes H, I, K, so that the index drawn on the circle is perpendicular to the side CD, the fourth pole of the needle will in like manner express the name of the metal inclosed. If the under-side of any one of the tablets be turned upward, the needle will be slower in its motion, on account of the greater distance of the bar. The gold and silver will still have the same direction; but the four other metals will be expressed by the letters on the interior circle. If any one of the metals be taken away, the needle will not then take any of the above directions, but naturally point to the north; and its motion will be much slower. You therefore give the box to any one, and leave him at liberty to dispose all the tablets in what manner and with what side upward he please, and even to take any one of them away. Then, by the aid of your perspective, you tell him immediately the name of the metal on each tablet, and of that he has taken away.

This box of metals will, on comparison, be found far to exceed that which has been publicly exhibited: for that, being composed of six tablets, of which two only differ in form, admits but of six different dispositions, whereas in this the tablets may be placed 720 different ways. In the other, you must also know the particular side of the box, which in this is not at all necessary. Nay, you may here distinguish each metal, though the box be completely covered with paper; for the effect of the needle will be always the same. The experiments with this box are therefore much more extraordinary, and its construction at the same time more simple.

#### 9. The magnetic planetarium.

CONSTRUCT a round box, ILMN, (fig. 9.), of eight or nine inches diameter, and half an inch deep. On its bottom fix a circle of pasteboard, on which draw the central circle A, and the seven circumjacent circles B, C, D, E, F, G, H. Divide the central circle into seven equal parts by the lines AB, AC, AD, AE, AF, AG, and AH, which must pass through the centres of the other circles, and divide each of them into two equal parts. Then divide the circumference of each of those circles into 14 equal parts, as in the figure. You are likewise to have another pasteboard of the same figure, and divided in the same manner, which must turn freely in the box, by means of an axis placed on a pivot; one end of which is to be fixed in the centre of the circle A. See fig. 10. On each of the seven smaller circles at the bottom of the box, place a magnetic bar, two inches long, in the same direction with the diameters of those circles, and their poles in the situations expressed in the figure. There must be an index O, like that of the hour-hand of a dial, which is to be fixed on the axis of the central circle, and by which the pasteboard circle in the box may be turned about. There must be also a needle P, which must turn freely on the axis, without moving the circular pasteboard.—In each of the seven divisions of the central circle write a different question; and in another circle, divided into 12 parts, you may write the names of the 12 months. In each of the seven circles write two answers to each question, observing that there must be but seven words in each an-

swer; in the following manner. In the first division of the circle G, which is opposite to the first question, write the first word of the first answer. In the second division of the next circle, write the second word; and so on to the last word, which will be in the seventh division of the seventh circle. In the eighth division of the first circle, write the first word of the second answer; in the ninth division of the second circle, write the second word of the same answer; and so on to the 14th division of the seventh circle, which must contain the last word of that answer. The same must be done for all the seven questions; and to each of them must be assigned two answers, the words of which are to be dispersed through the seven circles. At the center of each of these circles place a pivot; and have two magnetic needles, the pointed end of one of which must be north, and the other south, (QR). Now, the index of the central circle being directed to any one of the questions, if you place one of the two magnetic needles on each of the seven lesser circles, they will fix themselves according to the direction of the bars on the correspondent circles at the bottom of the box, and consequently point to the seven words that compose the answer. If you place one of the other needles on each circle, it will point to the words that are diametrically opposite to those of the first answer, the north pole being in the place of the fourth pole of the other.—You therefore present this planetarium to any person, and desire him to choose one of the questions there wrote; and you then set the index of the central circle to that question, and putting one of the needles on each of the seven circles, you turn it about; and when they all settle, they will point to the seven words that compose the answer. The two answers may be one favourable and the other unfavourable; and the different needles will serve to diversify the answers when you repeat the experiment.

There may be also a moveable needle to place against the names of the months; and when the party has fixed upon a question, you place that needle against the month in which he was born, which will give the business an air of more mystery. On the centre of the large circle may be the figure of the sun; and on each of the seven smaller circles one of the characters of the five planets, together with the earth and moon. This experiment, well executed, is one of the most entertaining that magnetism has produced.

#### 10. The sagacious swan.

PROVIDE a box XY, 18 inches long, nine wide, and two deep, the top of which is to slide on and off at the end Y. Toward the end X, describe a circle of six inches diameter, round which are to be fixed six small vials of wood or ivory, of one inch and a half high; and to each of them there must be a cover. At the end Y place an egg B, of ivory or other matter, of about three inches and a half high, with a cover that shuts by a hinge, and falls with a spring. It must be fixed on the stand C; through which, as well as the bottom of the egg, and the part of the box directly underneath, there must pass a hole of one-third of an inch in diameter. In this cavity place an ivory cylinder E, that can move freely, and rises or falls by means of the spring R. You must have a thin copper basin A, of six inches diameter, which is to be placed

on the centre of the circle at X, and consequently in the middle of the six vases. Let a proper workman construct the movement expressed by fig. 2. which is composed of a quadrant G, that has 16 teeth, and is moveable about an axis in the stand H, that has an elbow, by which it is screwed to the bottom of the box at L. To the quadrant there must be joined the straight piece K. The horizontal wheel M has 24 teeth; and is supported by the piece S, which is screwed to the end of the box next Y. On the axis of this wheel place a brass rod OP, five inches long; and at the part O place a large bar or horse-shoe, of a semi-circular form, and about two inches and a half diameter, strongly impregnated. The steel rod V, takes at one end the teeth of the quadrant G, by the pinion F, and at the other end the wheel M, by the perpendicular wheel N, of 30 teeth; the two ends of this rod are supported by the two stands that hold the other pieces. Under the piece K, that joins to the quadrant, must be placed the spring R, by which it is raised, and pushes up the cylinder that goes thro' the stand C into the egg. You must also have six small etwees or calcs, as Y, fig. 3. They must be of the same circumference with the cylinder in the stand, and round at their extremities: their length must be different, that, when they are placed in the egg, and the lower end enters the hole in which is the cylinder, they may thrust it down more or less, when the top of the egg, against which they press, is fastened down; and thereby lower the bar that is fixed to the end of the quadrant, and consequently, by means of the pinion (fig. 4.) and wheels N M (fig. 2.), turn the horse-shoe that is placed upon the axis of the last wheel. The exact length of these etwees can be determined by trials only; which trials, however, may be made with round pieces of wood. In each of these etwees place a different question, wrote on a slip of paper and rolled up, and in each of the vases put the answer to one of the questions; as you will know, by trials, where the magnetic bar or horse-shoe will stop. Lastly, provide a small figure of a swan, or what other you please, made of cork or enamel, in which you must fix a touched needle, of the largest size of those commonly used in sewing.

Being thus prepared, you offer a person the six etwees, and desire him to choose any one of them himself, and conceal the others, or give them to different persons. He is then to open his etwee, read the question it contains to himself, and return the etwee to you, after replacing the question. You then put the etwee in the egg, and, placing the swan upon the water in the basin, you tell the company she will presently discover in which of the vases the answer is con-

tained. The same experiment may be repeated with all the etwees.

# 11. The multifarious verse.

THE eight words that compose this Latin verse,  
*Tot sunt tibi doter, quot cali sidera, Virgo (A),*  
being privately placed in any one of the different combinations of which they are susceptible, and which are 40320 in number, to tell the order in which they are placed.

Provide a box that shuts with hinges, and is eight inches long, three wide, and half an inch deep. Have eight pieces of wood about one-third of an inch thick, two inches long, and one and a half wide, which will therefore, when placed close together, exactly fill the box. In each of these pieces or tablets place a magnetic bar, with their poles as is expressed in the figure. The bars being covered over, write on each of the tablets, in the order they then stand, one of the words of the foregoing Latin verse. On a very thin board of the same dimensions with the box, draw the eight circles, A, B, C, D, E, F, G, H, (fig. 12.) whose centres should be exactly over those of the eight tablets in the box when the board is placed upon it. Divide each of those circles into eight parts, as in the figure; and in each of those divisions write one of the words of the Latin verse, and in the precise order expressed in the plate; so that, when the board is placed over the box, the eight touched needles placed at the centre of the circles may be regulated by the poles of the bars in the box, and consequently the word that the needle points to in the circle be the same with that inscribed on the tablet. Cover the board with a glass, to prevent the needles from rising off their pivots, as is done in the sea-compass. Over the board place four plates of glass, I, L, M, N, fig. 13. which will give the machine the figure of a truncated pyramid, of eight inches high. Cover it with a glass, or rather a board in which are placed two lenses, O O, of eight inches focus, and distant from each other about half an inch. Line the four plates of glass that compose the sides with very thin paper, that will admit the light, and at the same time prevent the company from seeing the circles on the board.

These preparations being made, you give the box to any one; and tell him to place the tablets on which the words are wrote, privately, in what position he thinks proper, then to close the box, and, if he please, to wrap it up in paper, seal it, and give it you. Then placing the board with the pyramid upon it, you immediately tell him the order in which the tablets are placed, by reading the words to which the needles on the circles point.

pyandria class of plants.

*Species.* 1. The glauca or small magnolia is a native of Virginia, Carolina, and other parts of North America. In moist places it rises from seven or eight to 15 or 16 feet high, with a slender stem. The wood is white and spongy, the bark smooth and of a greenish white colour; the branches garnished with thick smooth leaves, like those of the bay; but of an oval shape, smooth on their edges, and white underneath.

Magnolia  
#  
Mahogany.

neath. The flowers are produced at the extremities of the branches; are white, composed of six concave petals, and have an agreeable scent. After the flowers are past, the fruit increases in size till it becomes as large as a walnut with its cover; but of a conical shape, having many cells round the outside, in each of which is a flat seed about the size of a small kidney-bean. When ripe, the fruit is of a brown colour, the seeds are discharged from their cells, and hang by a slender thread. 2. The grandiflora, or great magnolia, is a native of Florida and South Carolina. It rises to the height of 80 feet or more, with a straight trunk upwards of two feet diameter, having a regular head. The leaves resemble those of the laurel, but are larger, and continue green throughout the year. The flowers are produced at the ends of the branches, and are of a purplish white colour. 3. The tripetala, or umbrellatree, is a native of Carolina. It rises, with a slender trunk to the height of 16 or 20 feet; the wood is soft and spongy; the leaves remarkably large, and produced in horizontal circles, somewhat resembling an umbrella, from whence the inhabitants of those countries have given it this name. The flowers are composed of ten or eleven white petals, that hang down without any order. The leaves drop off at the beginning of winter. 4. The acuminata, with oval, spear-shaped, pointed leaves, is a native of the inland parts of North America. The leaves are near eight inches long, and five broad; ending in a point. The flowers come out early in the spring, and are composed of 12 white petals; the wood is of a fine grain, and an orange colour.

*Culture.* All these species are propagated by seeds, which must be procured from the places where they grow naturally. They should be put up in sand, and sent over as soon as possible; for if they are kept long out of the ground, they rarely grow.

MAGNUS (John), archbishop of Upsal, was born at Lincopping in 1488. Being made apostolical nuncio, he used his utmost endeavours to prevent Gustavus Vasa from becoming king of Sweden, and the introduction of Lutheranism into his dominions; and spared no means to attain these ends. He died at Rome in 1545. He wrote a history of Sweden, and a history of the archbishops and bishops of Upsal. He was succeeded by his brother Olaus Magnus.

MAGNUS CAMPUS, (anc. geog.), a tract lying towards Scythopolis, or Bethsan in Galilee, beyond which it extends into Samaria; Josephus placing the common boundary between these two districts, in the Campus Magnus. Called also *Ejærelon*, (Judith); 30 miles long, and 18 broad; having Samaria with mount Ephraim to the south, the lake Genesareth to the east, mount Carmel to the west, and Lebanon to the north.

MAGNUS PORTUS, (anc. geog.), a port of the Belgæ, in Britain, on the Channel. Now thought to be Portsmouth, in Hampshire, (Camden).—Another *Portus Magnus* of Bætica in Spain, (Ptolemy); a port to the east of Abdera.

MAGO, the name of several Carthaginian generals. See *CARTHAGE*.

MAGPY, in ornithology. See *CORYUS*.

MAHIE. See *BREAD-TREE*.

MAHO. See *HIBISCUS*.

MAHOGANY. See *CEDRUS*.

MAHOMET, or MOHAMMED, styled the *Impostor*, Mahomet. was born in the reign of Anushirwan the Just, emperor of Persia, about the end of the 6th century of the Christian era. He came into the world under some disadvantages. His father Abd'allah was a younger son of Abd'almotaleb; and dying very young, and in his father's lifetime, left his widow and infant-son in very mean circumstances, his whole substance consisting but of five camels and one Ethiopian slave. Abd'almotaleb was therefore obliged to take care of his grandchild Mahomet; which he not only did during his life, but at his death enjoined his eldest son Abu Taleb, who was brother to Abd'allah by the same mother, to provide for him for the future: which he very affectionately did, and instructed him in the business of a merchant, which he followed; and to that end he took him into Syria when he was but 13. He afterwards recommended him to Khadijah, a noble and rich widow, for her factor; in whose service he behaved himself so well, that by making him her husband she soon raised him to an equality with the richest in Mecca.

After he began by this advantageous match to live at his ease, it was, that he formed the scheme of establishing a new religion, or, as he expressed it, of replanting the only true and ancient one professed by Adam, Noah, Abraham, Moses, Jesus, and all the prophets, by destroying the gross idolatry into which the generality of his countrymen had fallen, and weeding out the corruptions and superstitions which the latter Jews and Christians had, as he thought, introduced into their religion, and reducing it to its original purity, which consisted chiefly in the worship of one only God.

Before he made any attempt abroad, he rightly judged that it was necessary for him to begin with the conversion of his own household. Having therefore retired with his family, as he had done several times before, to a cave in mount Hara, he there opened the secret of his mission to his wife Khadijah; and acquainted her, that the angel Gabriel had just before appeared to him, and told him that he was appointed the apostle of God: he also repeated to her a passage which he pretended had been revealed to him by the ministry of the angel, with those other circumstances of this first appearance, which are related by the Mahometan writers. Khadijah received the news with great joy; swearing by him in whose hands her soul was, that she trusted he would be the prophet of his nation; and immediately communicated what she had heard to her cousin Warakah Ebn Nawfal, who, being a Christian, could write in the Hebrew character, and was tolerably well versed in the scriptures; and he as readily came into her opinion, assuring her that the same angel who had formerly appeared unto Moses was now sent to Mahomet. The first overtture the prophet made was in the month of Ramadan, in the 40th year of his age, which is therefore usually called the year of his mission.

Encouraged by so good a beginning, he resolved to proceed, and try for some time what he could do by private persuasion, not daring to hazard the whole affair by exposing it too suddenly to the public. He soon made proselytes of those under his own roof, viz. his wife Khadijah, his servant Zeid Ebn Haretha (to whom

Mahomet. he gave his freedom on that occasion, (which afterwards became a rule to his followers) and his cousin and pupil Ali, the son of Abu Taleb, though then very young: but this last, making no account of the other two, used to style himself *the first of believers*. The next person Mahomet applied to was Abd'allah Ebn Abi Kohafa, surnamed *Abu Beer*, a man of great authority among the Koreish, and one whose interest he well knew would be of great service to him; as it soon appeared: for Abu Beer, being gained over, prevailed also on Othman Ebn Affan, Abd'alrahman Ebn Awf, Saad Ebn Abi Wakkas, al Zobeir Ebn al A-wam, and Telha Ebn Obeidallah, all principal men of Mecca, to follow his example. These men were the six chief companions, who, with a few more, were converted in the space of three years; at the end of which, Mahomet having, as he hoped, a sufficient interest to support him, made his mission no longer a secret, but gave out that God had commanded him to admonish his near relations; and in order to do it with more convenience and prospect of success, he directed Ali to prepare an entertainment, and invite the sons and descendants of Abd'almotaleb, intending then to open his mind to them. This was done, and about 40 of them came; but Abu Laheb, one of his uncles, making the company break up before Mahomet had an opportunity of speaking, obliged him to give them a second invitation the next day; and when they were come, he made them the following speech: "I know no man in all Arabia who can offer his kindred a more excellent thing than I now do you: I offer you happiness both in this life, and in that which is to come; God Almighty hath commanded me to call you unto him: Who, therefore, among you will be assiduous to me herein, and become my brother and my vicerger?" All of them hesitating, and declining the matter, Ali at length rose up, and declared that he would be his assiduous; and vehemently threatened those who should oppose him. Mahomet upon this embraced Ali with great demonstrations of affection, and desired all who were present to hearken to and obey him as his deputy; at which the company broke out into a great laughter, telling Abu Taleb that he must now pay obedience to his son.

This repulse, however, was so far from discouraging Mahomet, that he began to preach in public to the people; who heard him with some patience, till he came to upbraid them with the idolatry, obstinacy, and perverseness, of themselves and their fathers: which so highly provoked them, that they declared themselves his enemies; and would soon have procured his ruin, had he not been protected by Abu Taleb. The chief of the Koreish warmly solicited this person to desert his nephew, making frequent remonstrances against the innovations he was attempting; which proving ineffectual, they at length threatened him with an open rupture, if he did not prevail on Mahomet to desert. At this Abu Taleb was so far moved, that he earnestly dissuaded his nephew from pursuing the affair any farther, representing the great danger he and his friends must otherwise run. But Mahomet was not to be intimidated; telling his uncle plainly, *that if they set the sun against him on his right hand, and the moon on his left, he would not leave his enterprise*: and Abu Taleb, seeing him so firmly resolved to proceed, used no

further arguments, but promised to stand by him as Mahomet. gaint all his enemies.

The Koreish, finding they could prevail neither by fair words or menaces, tried what they could do by force and ill treatment; using Mahomet's followers so very injuriously, that it was not safe for them to continue at Mecca any longer: whereupon Mahomet gave leave to such of them as had not friends to protect them to seek for refuge elsewhere. And accordingly, in the fifth year of the prophet's mission, 16 of them, four of whom were women, fled into Ethiopia; and among them Othman Ebn Affan and his wife Rakiyah, Mahomet's daughter. This was the first flight; but afterwards several others followed them, retiring one after another, to the number of 83 men and 18 women, besides children. These refugees were kindly received by the Nadjah, or king of Ethiopia; who refused to deliver them up to those whom the Koreish sent to demand them, and, as the Arab writers unanimously attest, even professed the Mahometan religion.

In the sixth year of his mission, Mahomet had the pleasure of seeing his party strengthened by the conversion of his uncle Hamza, a man of great valour and merit; and of Omar Ebn al Kattab, a person highly esteemed, and once a violent opposer of the prophet. As persecution generally advances rather than obstructs the spreading of a religion, Islamism made so great a progress among the Arab tribes, that the Koreish, to suppress it effectually, if possible, in the seventh year of Mahomet's mission, made a solemn league or covenant against the Hashemites and the family of Abd'almotaleb, engaging themselves to contract no marriages with any of them, and to have no communication with them; and, to give it the greater sanction, reduced it into writing, and laid it up in the Caaba. Upon this the tribe became divided into two factions; and the family of Hashem all repaired to Abu Taleb, as their head; except only Abd'al Uzza, surnamed *Abu Laheb*, who, out of inveterate hatred to his nephew and his doctrine, went over to the opposite party, whose chief was Abu Sofian Ebn Harb, of the family of Ommeia.

The families continued thus at variance for three years; but, in the tenth year of his mission, Mahomet told his uncle Abu Taleb, that God had manifestly shewed his disapprobation of the league which the Koreish had made against them, by sending a worm to eat out every word of the instrument, except the name of God. Of this accident Mahomet had probably some private notice: for Abu Taleb went immediately to the Koreish, and acquainted them with it; offering, if it proved false, to deliver his nephew up to them; but, in case it were true, he insisted that they ought to lay aside their animosity, and annul the league they had made against the Hashemites. To this they acquiesced; and, going to inspect the writing, to their great astonishment found it to be as Abu Taleb had said; and the league was thereupon declared void.

In the same year Abu Taleb died, at the age of above fourscore; and it is the general opinion that he died an infidel: though others say, that when he was at the point of death he embraced Mahometanism; and produce some passages out of his poetical compositions to confirm their assertion. About a month, or, as some

write, three days after the death of this great benefactor and patron, Mahomet had the additional mortification to lose his wife Khadijah, who had so generously made his fortune. For which reason this year is called the *year of mourning*.

On the death of these two persons, the Koreish began to be more troublesome than ever to their prophet, and especially some who had formerly been his intimate friends; insomuch that he found himself obliged to seek for shelter elsewhere, and first pitched upon Tayef, about 60 miles east from Mecca, for the place of his retreat. Thither therefore he went, accompanied by his servant Zied, and applied himself to two of the chief of the tribe of Thakif who were the inhabitants of that place; but they received him very coldly. However, he staid there a month; and some of the more confidante and better sort of men treated him with a little respect: but the slaves and inferior people at length rose against him; and, bringing him to the wall of the city, obliged him to depart and return to Mecca, where he put himself under the protection of al Motaam Ebn Adi.

This repulse greatly discouraged his followers. However, Mahomet was not wanting to himself; but boldly continued to preach to the public assemblies at the pilgrimage, and gained several proselytes; and among them six of the inhabitants of Yathreb of the Jewish tribe of Khazraj, who, on their return home, failed not to speak much in commendation of their new religion, and exhorted their fellow-citizens to embrace the same.

In the 12th year of his mission it was that Mahomet gave out that he had made his night-journey from Mecca to Jerusalem, and thence to heaven, so much spoken of by all that write of him. Dr Prideaux thinks he invented it, either to answer the expectations of those who demanded some miracle as a proof of his mission; or else, by pretending to have conversed with God, to establish the authority of whatever he should think fit to leave behind by way of oral tradition, and make his sayings to serve the same purpose as the oral law of the Jews. But it does not appear that Mahomet himself ever expected so great a regard should be paid to his sayings, as his followers have since done; and seeing he all along disclaimed any power of performing miracles, it seems rather to have been a fetch of policy to raise his reputation, by pretending to have actually conversed with God in heaven, as Moses had heretofore done in the mount, and to have received several institutions immediately from him, whereas before he contented himself with persuading them that he had all by the ministry of Gabriel.

However, this story seemed to absurd and incredible, that several of his followers left him upon it; and had probably ruined the whole design, had not Abu Beer vouched for his veracity, and declared, that, if Mahomet affirmed it to be true, he verily believed the whole. Which happy incident not only retrieved the prophet's credit, but increased it to such a degree, that he was secure of being able to make his disciples swallow whatever he pleased to impose on them for the future. And this fiction, notwithstanding its extravagance, was one of the most artful contrivances Mahomet ever put in practice, and what chiefly contributed to the raising of his reputation to that great height to which

it afterwards arrived.

In this year, called by the Mahometans the *accepted year*, 12 men of Yathreb or Medina, of whom ten were of the tribe of Khazraj, and the other two of that of Aws, came to Mecca, and took an oath of fidelity to Mahomet at al Akaba, a hill on the north of that city. This oath was called the *women's oath*; not that any women were present at this time, but because a man was not thereby obliged to take up arms in defence of Mahomet or his religion; it being the same oath that was afterwards exacted of the women, the form of which we have in the Koran, and is to this effect: viz. That they should renounce all idolatry; and they should not steal, nor commit fornication, nor kill their children (as the Pagan Arabs used to do when they apprehended they should not be able to maintain them,) nor forge calumnies; and that they should obey the prophet in all things that were reasonable. When they had solemnly engaged to all this, Mahomet sent one of his disciples, named *Masab Ebn Omair*, home with them, to instruct them more fully in the grounds and ceremonies of his new religion.

Masab being arrived at Medina, by the assistance of those who had been formerly converted, gained several proselytes, particularly *Osaid Ebn Hodeira*, a chief man of the city, and *Asad Ebn Moadh*, prince of the tribe of Aws; Mahometanism spreading so fast, that there was scarce a house wherein there were not some who had embraced it.

The next year, being the 13th of Mahomet's mission, Masab returned to Mecca, accompanied by 73 men and two women of Medina who had professed Islamism, besides some others who were as yet unbelievers. On their arrival, they immediately sent to Mahomet, and offered him their assistance, of which he was now in great need; for his adversaries were by this time grown so powerful in Mecca, that he could not stay there much longer without imminent danger. Wherefore he accepted their proposal, and met them one night, by appointment, at al Akaba above-mentioned, attended by his uncle al Abbas; who, though he was not then a believer, wished his nephew well, and made a speech to those of Medina, wherein he told them, that as Mahomet was obliged to quit his native city, and seek an asylum elsewhere, and they had offered him their protection, they would do well not to deceive him; that if they were not firmly resolved to defend, and not betray him, they had better declare their minds, and let him provide for his safety in some other manner. Upon their protesting their sincerity, Mahomet swore to be faithful to them, on condition that they should protect him against all insults, as heartily as they would their own wives and families. They then asked him what recompence they were to expect if they should happen to be killed in his quarrel; he answered, Paradise. Whereupon they pledged their faith to him, and so returned home; after Mahomet had chosen 12 out of their number, who were to have the same authority among them as the 12 apostles of Christ had among his disciples.

Hitherto Mahomet had propagated his religion by fair means, so that the whole success of his enterprize, before his flight to Medina, must be attributed to persuasion only, and not to compulsion. For before this second oath of fealty or inauguration at al Akaba, he

**Mahomet.** had no permission to use any force at all; and in several places of the Koran, which he pretended were revealed during his stay at Mecca, he declares his business was only to preach and admonish; that he had no authority to compel any person to embrace his religion; and that, whether people believe or not, was none of his concern, but belonged solely unto God. And he was so far from allowing his followers to use force, that he exhorted them to bear patiently those injuries which were offered them on account of their faith; and, when persecuted himself, chose rather to quit the place of his birth and retire to Medina, than to make any resistance. But this great passiveness and moderation seem entirely owing to his want of power, and the great superiority of his opposers for the first 12 years of his mission; for no sooner was he enabled, by the assistance of those of Medina, to make head against his enemies, than he gave out, that God had allowed him and his followers to defend themselves against the infidels; and at length, as his forces increased, he pretended to have the divine leave even to attack them; and to destroy idolatry, and set up the true faith by the sword; finding, by experience, that his designs would otherwise proceed very slowly, if they were not utterly overthrown; and knowing, on the other hand, that innovators, when they depend solely on their own strength, and can compel, seldom run any risk; from whence, says Machiavel, it follows, that all the armed prophets have succeeded, and the unarmed ones have failed. Moses, Cyrus, Theseus, and Romulus, would not have been able to establish the observance of their institutions for any length of time, had they not been armed. The first passage of the Koran which gave Mahomet the permission of defending himself by arms, is said to have been that in the 22d chapter; after which a great number to the same purpose were revealed.

That Mahomet had a right to take up arms for his own defence against his unjust persecutors, may, perhaps, be allowed; but whether he ought afterwards to have made use of that means for the establishing of his religion, it is not so easy to determine. How far the secular power may or ought to interpose in affairs of this nature, mankind are not agreed. The method of converting by the sword gives no very favourable idea of the faith which is so propagated, and is disallowed by every body in those of another religion, though the same persons are willing to admit of it for the advancement of their own; supposing that, though a false religion ought not to be established by authority, yet a true one may; and accordingly force is almost as constantly employed in these cases by those who have the power in their hands, as it is constantly complained of by those who suffer the violence. It is certainly one of the most convincing proofs that Mahometism was no other than a human invention, that it owed its progress and establishment almost entirely to the sword; and it is one of the strongest demonstrations of the divine original of Christianity, that it prevailed against all the force and powers of the world by the mere dint of its own truth, after having stood the assaults of all manner of persecutions, as well as other oppositions, for 300 years together, and at length made the Roman emperors themselves submit thereto; after which time, indeed, this proof seems to fail, Christianity being then

established, and Paganism abolished, by public authority, which has had great influence in the propagation of the one and destruction of the other ever since. But to return.

Mahomet, having provided for the security of his companions as well as his own, by the league offensive and defensive which he had now concluded with those of Medina, directed them to repair thither, which they accordingly did; but himself with Abu Beer and Ali staid behind, having not yet received the divine permission, as he pretended, to leave Mecca. The Koreish, fearing the consequence of this new alliance, began to think it absolutely necessary to prevent Mahomet's escape to Medina; and having held a council thereon, after several milder expedients had been rejected, they came to a resolution that he should be killed; and agreed that a man should be chosen out of every tribe for the execution of this design; and that each man should have a blow at him with his sword, that the guilt of his blood might fall equally on all the tribes, to whose united power the Hahemites were much inferior, and therefore durst not attempt to revenge their kinsman's death.

This conspiracy was scarce formed, when, by some means or other, it came to Mahomet's knowledge; and he gave out that it was revealed to him by the angel Gabriel, who had now ordered him to retire to Medina. Whereupon, to amuse his enemies, he directed Ali to lie down in his place, and wrap himself up in his green cloak, which he did; and Mahomet escaped miraculously, as they pretend, to Abu Beer's house, unperceived by the conspirators, who had already assembled at the prophet's door. They, in the mean time, looking through the crevice, and seeing Ali, whom they took to be Mahomet himself, asleep, continued watching there till morning, when Ali awoke, and they found themselves deceived.

From Abu Beer's house Mahomet and he went to a cave in mount Thur, to the south-east of Mecca, accompanied only by Amer Ebn Fohairah, Abu Beer's servant, and Abd'allah Ebn Oreithah, an idolater whom they had hired for a guide. In this cave they lay hid three days, to avoid the search of their enemies; which they very narrowly escaped, and not without the assistance of more miracles than one: for some say that the Koreish were struck with blindness, so that they could not find the cave; others, that after Mahomet and his companions were got in, two pigeons laid their eggs at the entrance, and a spider covered the mouth of the cave with her web, which made them look no farther. Abu Beer, seeing the prophet in such imminent danger, became very sorrowful; whereupon Mahomet comforted him with these words, recorded in the Koran, *Be not grieved, for God is with us*. Their enemies being retired, they left the cave, and set out for Medina, by a by-road; and having fortunately, or, as the Mahometans tell us, miraculously escaped some who were sent to pursue them, arrived safely at that city; whither Ali followed them in three days, after he had settled some affairs at Mecca.

The first thing Mahomet did after his arrival at Medina, was to build a temple for his religious worship, and a house for himself, which he did on a parcel of ground which had before served to put camels

Mahomet, being securely settled at Medina, and able not only to defend himself against the insults of his enemies, but to attack them, began to send out small parties to make reprisals on the Koreish; the first party consisting of no more than nine men, who intercepted and plundered a caravan belonging to that tribe, and in the action took two prisoners. But what established his affairs very much, and was the foundation on which he built all his succeeding greatness, was the gaining of the battle of Bedr, which was fought in the second year of the Hejra, and is so famous in the Mahometan history. Some reckon no less than 27 expeditions wherein Mahomet was personally present, in nine of which he gave battle, besides several other expeditions in which he was not present. His forces he maintained partly by the contributions of his followers for this purpose, which he called by the name of *zaca*t or *alms*, and the paying of which he very artfully made one main article of his religion; and partly by ordering a fifth part of the plunder to be brought into the public treasury for that purpose, in which matter he likewise pretended to act by the divine direction.

In a few years, by the success of his arms (notwithstanding he sometimes came off by the worst) he considerably raised his credit and power. In the sixth year of the Hejra he set out with 1400 men to visit the temple of Mecca, not with any intent of committing hostilities, but in a peaceable manner. However, when he came to al Hodeibiya, which is situate partly within and partly without the sacred territory, the Koreish sent to let him know that they would not permit him to enter Mecca, unless he forced his way; whereupon he called his troops about him, and they all took a solemn oath of fealty or homage to him, and he resolved to attack the city; but those of Mecca sending Arwa Ebn Masud, prince of the tribe of Thakif, as their ambassador, to desire peace, a truce was concluded between them for ten years, by which any person was allowed to enter into league either with

Mahomet, or with the Koreish, as he thought fit. It may not be improper, to shew the inconceivable veneration and respect the Mahometans by this time had for their prophet, to mention the account which the above-mentioned ambassador gave the Koreish, at his return, of their behaviour. He said he had been at the courts both of the Roman emperor and of the king of Persia, and never saw any prince so highly respected by his subjects as Mahomet was by his companions: for, whenever he made the ablution, in order to say his prayers, they ran and caught the water that he had used; and, whenever he spit, they immediately licked it up, and gathered up every hair that fell from him with great superstition.

In the seventh year of the Hejra, Mahomet began to think of propagating his religion beyond the bounds of Arabia; and sent messengers to the neighbouring princes, with letters to invite them to Mahometism. Nor was this project without some success. Khofru Parviz, then king of Persia, received his letter with great disdain, and tore it in a passion, sending away the messenger very abruptly; which when Mahomet heard, he said *God shall tear his kingdom*. And soon after a messenger came to Mahomet from Badhan king of Yaman, who was a dependent on the Persians, to acquaint him that he had received orders to send him to Khofru. Mahomet put off his answer till the next morning, and then told the messenger it had been revealed to him that night that Khofru was slain by his son Shiruyeh; adding, that he was well assured his new religion and empire should rise to as great a height as that of Khofru; and therefore bid him advise his master to embrace Mahometism. The messenger being returned, Badhan in a few days received a letter from Shiruyeh, informing him of his father's death, and ordering him to give the prophet no further disturbance. Whereupon Badhan and the Persians with him turned Mahometans.

The emperor Heraclius, as the Arabian historians assure us, received Mahomet's letter with great respect, laying it on his pillow, and dismissed the bearer honourably. And some pretend that he would have professed this new faith, had he not been afraid of losing his crown.

Mahomet wrote to the same effect to the king of Ethiopia, though he had been converted before, according to the Arab writers; and to Mokawkas, governor of Egypt, who gave the messenger a very favourable reception, and sent several valuable presents to Mahomet, and among the rest two girls, one of which, named Mary, became a great favourite with him. He also sent letters of the like purport to several Arab princes: particularly one to al Hareth Ebn Abi Shamer king of Ghassan, who returning for answer that he would go to Mahomet himself, the prophet said, *May his kingdom perish*: another to Hawdha Ebn Ali, king of Yamama, who was a Christian, and, having some time before professed Islamism, had lately returned to his former faith; this prince sent back a very rough answer, upon which Mahomet curling him, he died soon after: and a third to al Mondar Ebn Sawa, king of Bahrein, who embraced Mahometism, and all the Arabs of that country followed his example.

The eighth year of the Hejra was a very fortunate

Mahomet. nate year to Mahomet. In the beginning of it, Khaled Ebn al Walid and Amru Ebn al As, both excellent soldiers, the first of whom afterwards conquered Syria and other countries, and the latter Egypt, became profelytes of Mahometism. And soon after the prophet sent 3000 men against the Grecian forces, to revenge the death of one of his ambassadors, who, being sent to the governor of Bosra on the same errand as those who went to the above-mentioned princes, were slain by an Arab, of the tribe of Ghassan, at Muta, a town in the territory of Balka in Syria, about three days journey eastward from Jerusalem, near which town they encountered. The Grecians being vastly superior in number, (for, including the auxiliary Arabs, they had an army of 100,000 men,) the Mahometans were repulsed in the first attack, and lost successively three of their generals, viz. Zeid Ebn Haretha Mahomet's freedman, Jaafar the son of Abu Taleb, and Abdallah Ebn Rawaha: but Khaled Ebn al Walid succeeding to the command, overthrew the Greeks with a great slaughter, and brought away abundance of rich spoil; on occasion of which action Mahomet gave him the title of *Seif min sayuf Allah*, "one of the swords of God."

In this year also Mahomet took the city of Mecca, the inhabitants whereof had broken the truce concluded on two years before. For the tribe of Bacr, who were confederates with the Koreithi, attacking those of Khozaah, who were allies of Mahomet, killed several of them, being supported in the action by a party of the Koreithi themselves. The consequence of this violation was soon apprehended; and Abu Sofian himself made a journey to Medina on purpose to heal the breach and renew the truce: but in vain; for Mahomet, glad of this opportunity, refused to see him: whereupon he applied to Abu Bacr and Ali; but they giving him no answer, he was obliged to return to Mecca as he came.

Mahomet immediately gave orders for preparations to be made, that he might surprize the Meccans while they were unprovided to receive him: in a little time he began his march thither; and by that time he came near the city, his forces were increased to 10,000 men. Those of Mecca, being not in a condition to defend themselves against so formidable an army, surrendered at discretion; and Abu Sofian saved his life by turning Mahometan. About 28 of the idolaters were killed by a party under the command of Khaled; but this happened contrary to Mahomet's orders, who, when he entered the town, pardoned all the Koreithi on their submission, except only six men and four women, who were more obnoxious than ordinary, (some of them having apostatized), and were solemnly proscribed by the prophet himself; but of these no more than three men and one woman were put to death, the rest obtaining pardon on their embracing Mahometism, and one of the women making her escape.

The remainder of this year Mahomet employed in destroying the idols in and round Mecca, sending several of his generals on expeditions for that purpose, and to invite the Arabs to Islamism; wherein it is no wonder if they now met with success.

The next year, being the ninth of the Hejra, the Mahometans call the year of embassies: for the Arabs

had been hitherto expecting the issue of the war between Mahomet and the Koreithi: but, so soon as that tribe, the principal of the whole nation, and the genuine descendants of Ishmael, whose prerogatives none offered to dispute, had submitted, they were satisfied that it was not in their power to oppose Mahomet; and therefore began to come in to him in great numbers, and to send embassies to make their submissions to him, both to Mecca, while he laid there, and also to Medina, whither he returned this year. Among the rest, five kings of the tribe of Hamyar professed Mahometism, and sent ambassadors to notify the same.

In the 10th year, Ali was sent into Yaman to propagate the Mahometan faith there; and, as it is said, converted the whole tribe of Hamdan in one day. Their example was quickly followed by all the inhabitants of that province, except only those of Najran, who, being Christians, chose rather to pay tribute.

Thus was Mahometism established, and idolatry rooted out, even in Mahomet's lifetime (for he died the next year,) throughout all Arabia, except only Yamama, where Moseilama, who set up also for a prophet as Mahomet's competitor, had a great party, and was not reduced till the khalifat of Abu Bacr: and the Arabs being then united in one faith, and under one prince, found themselves in a condition of making those conquests, which extended the Mahometan faith over so great a part of the world.

**MAHOMETANISM, or MAHOMETISM**, the system of religion broached by Mahomet, and still adhered to by his followers. See **MAHOMET**, and **ALCORAN**.

Mahometanism is professed by the Turks, Persians, and several nations among the Africans, and many among the East-Indians.

The Mahometans divide their religion into two general parts, faith and practice: of which the first is divided into six distinct branches; Belief in God, in his angels, in his scriptures, in his prophets, in the resurrection and final judgment, and in God's absolute decrees. The points relating to practice are, Prayer, with washings, &c. alms, fasting, pilgrimage to Mecca, and circumcision.

I. Of the Mahometan Faith. 1. That both Mahomet and those among his followers who are reckoned orthodox, had and continue to have just and true notions of God and his attributes, appears so plain from the Koran itself, and all the Mahometan divines, that it would be loss of time to refute those who suppose the God of Mahomet to be different from the true God, and only a fictitious deity or idol of his own creation.

2. The existence of angels, and their purity, are absolutely required to be believed in the Koran; and he is reckoned an infidel who denies there are such beings, or hates any of them, or asserts any distinction of sexes among them. They believe them to have pure and subtle bodies, created of fire; that they neither eat nor drink, nor propagate their species; that they have various forms and offices, some adoring God in different postures, others singing praises to him, or interceding for mankind. They hold, that some of them are employed in writing down the ac-

Mahomet,  
Mahome-  
tanism.

Mahometanism.

tions of men; others in carrying the throne of God, and other services.

The four angels, whom they look on as more eminently in God's favour, and often mention on account of the offices assigned them, are, Gabriel, to whom they give several titles, particularly those of the *holy spirit*, and the *angel of revelations*, supposing him to be honoured by God with a greater confidence than any other, and to be employed in writing down the divine decrees; Michael, the friend and protector of the Jews; Azrael, the *angel of death*, who separates mens souls from their bodies; and Israfil, whose office it will be to sound the trumpet at the resurrection. The Mahometans also believe, that two guardian angels attend on every man, to observe and write down his actions, being changed every day, and therefore called *al Moakkibat*, or "the angels who continually succeed one another."

The devil, whom Mahomet names *Eblis*, from his *despair*, was once one of those angels who are nearest to God's presence, called *Azazil*; and fell, according to the doctrine of the Koran, for refusing to pay homage to Adam at the command of God.

Besides angels and devils, the Mahometans are taught by the Koran to believe an intermediate order of creatures, which they call *jin* or *genii*, created also of fire, but of a grosser fabric than angels, since they eat and drink, and propagate their species, and are subject to death. Some of these are supposed to be good, and others bad, and capable of future salvation or damnation, as men are; whence Mahomet pretended to be sent for the conversion of *genii* as well as men.

3. As to the scriptures, the Mahometans are taught by the Koran, that God, in divers ages of the world, gave revelations of his will in writing to several prophets, the whole and every one of which it is absolutely necessary for a good Moslem to believe. The number of these sacred books were, according to them, 104. Of which 10 were given to Adam, 50 to Seth, 30 to Edris or Enoch, 10 to Abraham; and the other four, being the Pentateuch, the Psalms, the Gospel, and the Koran, were successively delivered to Moses, David, Jesus, and Mahomet; which last being the seal of the prophets, those revelations are now closed, and no more are to be expected. All these divine books, except the four last, they agree to be now entirely lost, and their contents unknown; though the Sabians have several books which they attribute to some of the antediluvian prophets. And of those four, the Pentateuch, Psalms, and Gospel, they say, have undergone so many alterations and corruptions, that, though there may possibly be some part of the true word of God therein, yet no credit is to be given to the present copies in the hands of the Jews and Christians. The Mahometans have also a gospel in Arabic, attributed to St Barnabas; wherein the history of Jesus Christ is related in a manner very different from what we find in the true gospels, and correspondent to those traditions which Mahomet has followed in his Koran. Of this gospel the Moriscos in Africa have a translation in Spanish; and there is, in the library of prince Eugene of Savoy, a manuscript of some antiquity, containing an Italian translation of the same gospel; made, it is to be supposed, for the use of re-

Mahometanism.

negades. This book appears to be no original forgery of the Mahometans; though they have, no doubt, interpolated and altered it since, the better to serve their purpose; and in particular, instead of the *Paraclete*, or *Comforter*, they have in this apocryphal gospel inserted the word *Periclyte*, that is, the "famous," or "illustrious;" by which they pretend their prophet was foretold by name, that being the signification of *Mohammed* in Arabic: and this they say to justify that passage of the Koran, where Jesus Christ is formally asserted to have foretold his coming, under his other name of *Ahmed*, which is derived from the same root as *Mohammed*, and of the same import. From these, or some other forgeries of the same stamp, it is that the Mahometans quote several passages, of which there are not the least footsteps in the New Testament.

4. The number of the prophets, which have been from time to time sent by God into the world, amounts to no less than 224,000, according to one Mahometan tradition; or to 124,000, according to another: among whom 313 were apostles, sent with special commissions to reclaim mankind from infidelity and superstition; and six of them brought new laws or dispensations, which successively abrogated the preceding: these were Adam, Noah, Abraham, Moses, Jesus, and Mahomet. All the prophets in general, the Mahometans believe to have been free from great sins and errors of consequence, and professors of one and the same religion, that is, Islam, notwithstanding the different laws and institutions which they observed. They allow of degrees among them, and hold some of them to be more excellent and honourable than others. The first place they give to the revealers and establishers of new dispensations, and the next to the apostles.

In this great number of prophets, they not only reckon divers patriarchs and persons named in scripture, but not recorded to have been prophets, (wherein the Jewish and Christian writers have sometimes led the way,) as Adam, Seth, Lot, Ishmael, Nun, Joshua, &c. and introduce some of them under different names, as *Enoch*, *Heber*, and *Jethro*, who are called, in the Koran, *Edris*, *Hud*, and *Shoaib*; but several others whose very names do not appear in scripture (though they endeavour to find some persons there to fix them on), as Saleh, Khedr, Dhul'kehl, &c.

5. The belief of a general resurrection and a future judgment.

When a corpse is laid in the grave, they say he is received by an angel, who gives him notice of the coming of the two examiners; who are two black livid angels, of a terrible appearance, named *Monker* and *Nakir*. These order the dead person to sit upright; and examine him concerning his faith, as to the unity of God, and the mission of Mahomet: if he answer rightly, they suffer the body to rest in peace, and it is refreshed by the air of paradise; but, if not, they beat him on the temples with iron maces, till he roars out for anguish so loud, that he is heard by all from east to west, except men and *genii*. They then press the earth on the corpse, which is gnawed and stung till the resurrection by 99 dragons, with seven heads each; or, as others say, their sins will become veno-

mous

Mahometanifu.

mous beasts, the grievous ones stinging like dragons, the smaller like scorpions, and the other like serpents: circumstances which some understand in a figurative sense.

As to the soul, they hold, that, when it is separated from the body by the angel of death, who performs his office with ease and gentleness towards the good, and with violence towards the wicked, it enters into that which they call *al berzakh*, or the interval between death and the resurrection. If the departed person was a believer, they say two angels meet it, who convey it to heaven, that its place there may be assigned, according to its merit and degree. For they distinguish the souls of the faithful into three classes: the first of prophets, whose souls are admitted into paradise immediately; the second of martyrs, whose spirits, according to a tradition of Mahomet, rest in the crops of green birds, which eat of the fruits and drink of the rivers of paradise; and the third of other believers, concerning the state of whose souls before the resurrection there are various opinions.

Though some among the Mahometans have thought that the resurrection will be merely spiritual, and no more than the returning of the soul to the place whence it first came (an opinion defended by Ebn Sina, and called by some the *opinion of the philosophers*;) and others, who allow man to consist of body only, that it will be merely corporeal; the received opinion is, that both body and soul will be raised: and their doctors argue strenuously for the possibility of the resurrection of the body, and dispute with great subtilty concerning the manner of it. But Mahomet has taken care to preserve one part of the body, whatever becomes of the rest, to serve for a basis of the future edifice, or rather a haven for the souls which is to be joined to it. For he taught, that a man's body was entirely consumed by the earth, except only the bone called *al ajib*, which we name the *os coccygis*, or rump-bone; and that, as it was the first formed in the human body, it will also remain uncorrupted till the last day, as a seed from whence the whole is to be renewed; and this, he said, would be effected by a forty-days rain, which God should send, and which would cover the earth to the height of 12 cubits, and cause the bodies to sprout forth like plants. Herein, also, is Mahomet beholden to the Jews; who say the same things of the bone Luz, excepting that what he attributes to a great rain, will be effected, according to them, by a dew, impregnating the dust of the earth.

The time of the resurrection the Mahometans allow to be a perfect secret to all but God alone; the angel Gabriel himself acknowledging his ignorance in this point, when Mahomet asked him about it. However, they say, the approach of that day may be known from certain signs which are to precede it. These signs they distinguish into two sorts, the lesser, and the greater.

The lesser signs are, 1. The decay of faith among men. 2. The advancing of the meanest persons to eminent dignity. 3. That a maid-servant shall become the mother of her mistress (or master;) by which is meant, either that towards the end of the world men shall be much given to sensuality, or that the Mahometans shall then take many captives. 4. Tumults and seditions. 5. A war with the Turks. 6. Great

distress in the world, so that a man, when he passes by another's grave, shall say, Would to God I were in his place. 7. That the provinces of Irak and Syria shall refuse to pay their tribute. And, 8. That the buildings of Median shall reach to Ahab, or Yahab.

The greater signs are, 1. The sun's rising in the west; which some have imagined it originally did. 2. The appearance of the beast, which shall rise out of the earth, in the temple of Mecca, or on mount Safa, or in the territory of Tayef, or some other place. This beast, they say, is to be sixty cubits high; though others, not satisfied with so small a size, will have her reach to the clouds and to heaven, when her head only is out; and that she will appear for three days, but shew only a third part of her body. They describe this monster, as to her form, to be a compound of various species; having the head of a bull, the eyes of a hog, the ears of an elephant, the horns of a stag, the neck of an ostrich, the breast of a lion, the colour of a tiger, the back of a cat, the tail of a ram, the legs of a camel, and the voice of an ass. Some say this beast is to appear three times in several places, and that she will bring with her the rod of Moses and the seal of Solomon; and, being so swift that none can overtake or escape her, will with the first strike all the believers on the face, and mark them with the word *mumen*, i. e. believers; and with the latter will mark the unbelievers on the face likewise, with the word *Casfer*, i. e. infidel, that every person may be known for what he really is. They add, that the same beast is to demonstrate the vanity of all religions except Islam, and to speak Arabic. All this stuff seems to be the result of a confused idea of the beast in the Revelations. 3. War with the Greeks, and the taking Constantinople by 70,000 of the posterity of Isaac, who shall not win that city by force of arms, but the walls shall fall down while they cry out, *There is no God but God, God is most great!* As they are dividing the spoil, news will come to them of the appearance of Antichrist; whereupon they shall leave all, and return back. 4. The coming of Antichrist, whom the Mahometans call *Masib al Dajjal*, i. e. the false or lying Christ, and simply *al Dajjal*. He is to be one-eyed, and marked on the forehead with the letters C. F. R. signifying *Casfer*, or infidel. They say that the Jews give him the name of Messiah Ben David; and pretend he is to come in the last days, and to be lord both of land and sea, and that he will restore the kingdom to them. 5. The descent of Jesus on earth. They pretend that he is to descend near the white tower to the east of Damascus, when the people are returned from the taking of Constantinople: that he is to embrace the Mahometan religion, marry a wife, get children, kill Antichrist; and at length die after 40 years, or, according to others, 24 years continuance on earth. Under him, they say, there will be great security and plenty in the world, all hatred and malice being laid aside; when lions and camels, bears and sheep, shall live in peace, and a child shall play with serpents unhurt. 6. War with the Jews; of whom the Mahometans are to make a prodigious slaughter, the very trees and stones discovering such of them as hide themselves, except only the tree called *gharkad*, which is the tree of the Jews. 7. The eruption of Gog and Magog, or, as they are called in the east, *Tajuj* and *Majuj*;

Mahometanifm.

*Majui*; of whom many things are related in the Koran and the traditions of Mahomet. These barbarians, they tell us, having paffed the lake of Tiberias, which the vanguard of their vast army will drink dry, will come to Jerufalm, and there greatly diftrefs Jefus and his companions; till, at his request, God will destroy them, and fill the earth with their carcafes, which, after fome time, God will fend birds to carry away, at the prayers of Jefus and his followers. Their bows, arrows, and quivers, the Moflems will burn for feven years together; and at laft, God will fend a rain to cleanse the earth and to make it fertile. 8. A fmoke, which fhall fill the whole earth. 9. An eclipse of the moon. Mahomet is reported to have faid, that there would be three eclipses before the laft hour; one to be feen in the east, another in the weft, and the third in Arabia. 10. The returning of the Arabs to the worfhip of Allat and al Uzza, and the ref of their ancient idols, after the deceafe of every one in whose heart there was faith equal to a grain of muftard-feed, none but the very worst of men being left alive. For God, they fay, will fend a cold odoriferous wind, blowing from Syria Damafcena, which fhall fweep away the fouls of all the faithful, and the Koran itfelf, fo that men will remain in the groffeft ignorance for 100 years. 11. The difcovery of a vast heap of gold and filver by the retreating of the Euphrates, which will be the destruction of many. 12. The demolition of the Caaba, or temple of Mecca, by the Ethiopians. 13. The fpeaking of beafts and inanimate things. 14. The breaking out of fire in the province of Hejaz; or, according to others, in Yamaa. 15. The appearance of a man of the descendants of Kahtan, who fhall drive men before him with his staff. 16. The coming of the Mohdi, or director; concerning whom Mahomet prophefied, that the world fhould not have an end till one of his own family fhould govern the Arabians, whose name fhould be the fame with his own name, and whose father's name fhould alfo be the fame with his father's name; and who fhould fill the earth with righteoufnefs. This perfon the Shiites believe to be now alive, and concealed in fome fecret place till the time of his manifeftation; for they fuppofe him no other than the laft of the twelve Imams, named Mahomet Abu'lkafem, as their prophet was; and the fon of Haffan al Afkeri, the eleventh of that fucceffion. He was born at Sernamrai, in the 257th year of the Hgira. From this tradition, it is to be prefumed, an opinion pretty current among the Chriftians took its rife, that the Mahometans are in expectation of their prophet's return. 17. A wind which fhall fweep away the fouls of all who have but a grain of faith in their hearts, as has been mentioned under the tenth fign.

These are the greater figns, which, according to their doctrine, are to precede the refurrektion, but ftill leave the hour of it uncertain; for the immediate fign of its being come will be the firft blaft of the trumpet, which they believe will be founded three times. The firft they call the *blaft of confternation*; at the hearing of which all creatures in heaven and earth fhall be ftruck with terror, except thofe whom God fhall pleafe to exempt from it. The effects attributed to this firft found of the trumpet are very wonderful: for they fay, the earth will be fhaken, and not only all buildings,

Mahometanifm.

but the very mountains levelled; that the heavens fhall melt, the fun be darkened, the ftars fall, on the death of the angels, who, as fome imagine, hold them fufpended between heaven and earth; and the fea fhall be troubled and dried up, or, according to others, turned into flames, the fun, moon, and ftars being thrown into it: the Koran, to exprefs the greatnefs of the terror of that day, adds, that women who give fuck fhall abandon the care of their infants, and even the camels which have gone ten months with young (a moft valuable part of the fubftance of that nation) fhall be utterly neglected. A farther effect of this blaft will be that concourfe of beafts mentioned in the Koran, though fome doubt whether it be to precede the refurrektion or not. They who fuppofe it will precede, think that all kinds of animals, forgetting their refpective natural ferencels and timidity, will run together into one place, being terrified by the found of the trumpet and the fudden fhock of nature.

The Mahometans believe that this firft blaft will be followed by a fecond, which they call the *blaft of examination*; by which all creatures both in heaven and earth fhall die or be annihilated, except thofe which God fhall pleafe to exempt from the common fate; and this, they fay, fhall happen in the twinkling of an eye, nay in an instant; nothing furviving except God alone, with paradife and hell, and the inhabitants of thofe two places, and the throne of glory. The laft who fhall die will be the angel of death.

Forty years after this will be heard the *blaft of refurrektion*, when the trumpet fhall be founded the third time by Ifrafil, who, together with Gabriel and Michael will be previoufly reftored to life, and, ftanding on the rock of the temple of Jerufalem, fhall, at God's command, call together all the dry and rotten bones, and other difperfed parts of the bodies, and the very hairs, to judgment. This angel, having, by the divine order, fet the trumpet to his mouth, and called together all the fouls from all parts, will throw them into his trumpet, from whence, on his giving the laft found, at the command of God, they will fly forth like bees, and fill the whole fpace between heaven and earth, and then repair to their refpective bodies, which the opening earth will fuffer to arife; and the firft who fhall fo arife, according to a tradition of Mahomet, will be himfelf. For this birth the earth will be prepared by the rain above-mentioned, which is to fall continually for 40 years, and will refemble the feed of a man, and be fupplied from the water under the throne of God, which is called *living water*; by the efficacy and virtue of which the dead bodies fhall fpring forth from their graves, as they did in their mother's womb, or as corn fprouts forth by common rain, till they become perfect; after which breath will be breathed into them, and they will fleep in their fepulchres till they are raifed to life at the laft trumpet.

When thofe who have rifen fhall have waited the limited time, the Mahometans believe God will at length appear to judge them; Mahomet undertaking the office of interceffor, after it fhall have been declined by Adam, Noah, Abraham, and Jefus, who fhall beg deliverance only for their own fouls. They fay, that on this folemn occafion God will come in the clouds furred by angels, and will produce the books where, in the actions of every perfon are recorded by their guardias

Mahome-  
tanisin.

guardian angels, and will command the prophets to bear witness against those to whom they have been respectively sent. Then every one will be examined concerning all his words and actions uttered and done by him in this life; not as if God needed any information in these respects, but to oblige the person to make public confession and acknowledgment of God's justice. The particulars of which they shall give an account, as Mahomet himself enumerated them, are, of their time, how they spent it; of their wealth, by what means they acquired it, and how they employed it; of their bodies, wherein they exercised them; of their knowledge and learning, what use they made of them. To the questions we have mentioned each person shall answer, and make his defence in the best manner he can, endeavouring to excuse himself by casting the blame of his evil deeds on others; so that a dispute shall arise even between the foul and the body, to which of them their guilt ought to be imputed: the soul saying, *O Lord, my body I received from thee; for thou createdst me without a hand to lay hold with, a foot to walk with, an eye to see with, or an understanding to apprehend with, till I came and entered into this body; therefore punish it eternally, but deliver me.* The body, on the other side, will make this apology: *O Lord, thou createdst me like a flock of wood, having neither hand that I could lay hold with, nor foot that I could walk with, till this soul, like a ray of light, entered into me, and my tongue began to speak, my eye to see, and my foot to walk; therefore punish it eternally, but deliver me.* But God will propound to them the following parable of the blind man and the lame man, which, as well as the preceding dispute, was borrowed by the Mahometans from the Jews. A certain king, having a pleasant garden, in which were ripe fruits, set two persons to keep it, one of whom was blind, and the other lame; the former not being able to see the fruit, nor the latter to gather it: the lame man, however, seeing the fruit, persuaded the blind man to take him upon his shoulders, and by that means he easily gathered the fruit; which they divided between them. The lord of the garden coming some time after, and inquiring after his fruit, each began to excuse himself: the blind man said he had no eyes to see with; and the lame man, that he had no feet to approach the trees. But the king, ordering the lame man to be set on the blind, passed sentence on and punished them both. And in the same manner will God deal with the body and the soul. As these apologies will not avail on that day, so it will be in vain for any one to deny his evil actions; since men and angels, and his own members, nay, the very earth itself, will be ready to bear witness against him.

At this examination, they also believe, that each person will have the book wherein all the actions of his life are written delivered to him: which books the righteous will receive into their right hand, and read with great pleasure and satisfaction; but the ungodly will be obliged to take them, against their wills, in their left, which will be bound behind their backs, and their right hand being tied up to their necks.

To show the exact justice which will be observed on this great day of trial, the next thing they describe is the balance, wherein all things shall be weighed. They say it will be held by Gabriel; and that it is of so vast

Mahome-  
tanisin.

a size, that its two scales, one of which hangs over paradise, and the other over hell, are capacious enough to contain both heaven and hell. Though some are willing to understand what is said in the Koran concerning this balance allegorically, and only as a figurative representation of God's equity; yet the more ancient and orthodox opinion is, that they are to be taken literally; and since words and actions, being mere accidents, are not capable of being themselves weighed, they say that the books wherein they are written will be thrown into the scales, and according as those wherein the good or evil actions are recorded shall preponderate, sentence will be given: those whose balances laden with good works shall be heavy, will be saved; but those whose balances are light, will be condemned. Nor will any one have cause to complain that God suffers any good action to pass unrewarded, because the wicked for the good they do have their reward in this life, and therefore can expect no favour in the next.

This examination being past, and every one's works weighed in a just balance, that mutual retaliation will follow, according to which every creature will take vengeance one of another, or have satisfaction made them for the injuries which they have suffered. And, since there will then be no other way of returning like for like, the manner of giving this satisfaction will be by taking away a proportional part of the good works of him who offered the injury, and adding it to those of him who suffered it. Which being done, if the angels (by whose ministry this is to be performed) say, *Lord, we have given to every one his dues, and there remaineth of this person's good works so much as equalleth the weight of an ant,* God will, of his mercy, cause it to be doubled unto him, that he may be admitted into paradise; but if, on the contrary, his good works be exhausted, and there remain evil works only, and there be any who have not yet received satisfaction from him, God will order that an equal weight of their sins be added unto his, that he may be punished for them in their stead, and he will be sent to hell laden with both. This will be the method of God's dealing with mankind. As to brutes, after they shall have likewise taken vengeance of one another, he will command them to be changed into dust; wicked men being reserved to more grievous punishment, so that they shall cry out, on hearing this sentence passed on the brutes, *Would to God that we were dust also.* As to the geni, many Mahometans are of opinion, that such of them as are true believers, will undergo the same fate as the irrational animals, and have no other reward than the favour of being converted into dust; and for this they quote the authority of their prophet.

The trials being over, and the assembly dissolved, the Mahometans hold, that those who are to be admitted into paradise will take the right-hand way, and those who are destined to hell fire will take the left; but both of them must first pass the bridge called in Arabic *al Sirat*, which they say is laid over the midst of hell, and describe to be finer than a hair, and sharper than the edge of a sword; so that it seems very difficult to conceive how any one shall be able to stand upon it: for which reason, most of the sect of the Motazalites reject it as a fable; though the orthodox think it a sufficient proof of the truth of this article, that it was seriously affirmed by him who never asserted a falsehood,

M. home-  
tanifin.

meaning their prophet : who, to add to the difficulty of the passage, has likewise declared, that this bridge is beset on each side with briars and hooked thorns : which will however be no impediment to the good; for they shall pass with wonderful ease and swiftness, like lightning, or the wind, Mahomet and his Moslems leading the way; whereas the wicked, what with the slipperiness and extreme narrowness of the path, the intermingling of the thorns, and the extinction of the light which directed the former to paradise, will soon miss their footing, and fall down headlong into hell, which is gaping beneath them.

As to the punishment of the wicked, the Mahometans are taught, that hell is divided into seven stories or apartments, one below another, designed for the reception of as many distinct classes of the damned. The first, which they call *Jehennam*, they say, will be the receptacle of those who acknowledged one God, that is, the wicked Mahometans; who, after having there been punished according to their demerits, will at length be released. The second, named *Ladha*, they assign to the Jews; the third, named *al Hotama*, to the Christians; the fourth, named *al Sair*, to the Sabians; the fifth, named *Sakar*, to the Magians; the sixth, named *al Jabim*, to the idolaters; and the seventh, which is the lowest and worst of all, and is called *al Hawyat*, to the hypocrites, or those who outwardly professed some religion, but in their hearts were of none. Over each of these apartments they believe there will be set a guard of angels, 19 in number; to whom the damned will confess the just judgment of God, and beg them to intercede with him for some alleviation of their pain, or that they may be delivered by being annihilated.

Mahomet has, in his Koran and traditions, been very exact in describing the various torments of hell, which, according to him, the wicked will suffer both from intense heat and excessive cold. We shall, however, enter into no detail of them here; but only observe, that the degrees of these pains will also vary in proportion to the crimes of the sufferers, and the apartment he is condemned to; and that he who is punished the most lightly of all will be shod with shoes of fire, the fervour of which will cause his skull to boil like a cauldron. The condition of these unhappy wretches, as the same prophet teaches, cannot be properly called either *life* or *death*; and their misery will be greatly increased by their despair of being ever delivered from that place, since, according to that frequent expression in the Koran, they *must remain therein for ever*. It must be remarked, however, that the infidels alone will be liable to eternity of damnation; for the Moslems, or those who have embraced the true religion, and have been guilty of heinous sins, will be delivered thence after they shall have expiated their crimes by their sufferings. The time which these believers shall be detained there, according to a tradition handed down from their prophet, will not be less than 900 years, nor more than 7000. And, as to the manner of their delivery, they say that they shall be distinguished by the marks of prostration on those parts of their bodies with which they used to touch the ground in prayer, and over which the fire will therefore have no power; and that, being known by this characteristic, they will be released by the mercy

of God, at the intercession of Mahomet and the blessed: whereupon those who shall have been dead, will be restored to life, as has been said; and those whose bodies shall have contracted any foulness or filth from the flames and smoke of hell, will be immersed in one of the rivers of paradise, called the *river of life*, which will wash them whiter than pearls.

The righteous, as the Mahometans are taught to believe, having surmounted the difficulties, and passed the sharp bridge abovementioned, before they enter paradise, will be refreshed by drinking at the *pond* of their prophet, who describes it to be an exact square of a month's journey in compass; its water, which is supplied by two pipes from *al Cawthar*, one of the rivers of paradise, being whiter than milk or silver, and more odorous than musk, with as many cups set around it as there are stars in the firmament; of which water whoever drinks will thirst no more for ever. This is the first taste which the blessed will have of their future and now near-approaching felicity.

Though paradise be so very frequently mentioned in the Koran, yet it is a dispute among the Mahometans whether it be already created, or to be created hereafter; the Motazalites and some other sectaries asserting, that there is not at present any such place in nature, and that the paradise which the righteous will inhabit in the next life will be different from that from which Adam was expelled. However, the orthodox profess the contrary, maintaining that it was created even before the world, and describe it, from their prophet's traditions, in the following manner.

They say it is situated above the seven heavens (or in the seventh heaven), and next under the throne of God; and, to express the amenity of the place, tell us, that the earth of it is of the finest wheat-flour, or of the purest musk, or, as others will have it, of saffron: that its stones are pearls and jacinths, the walls of its buildings enriched with gold and silver, and that the trunks of all its trees are of gold: among which the most remarkable is the tree called *Tuba*, or the tree of happiness. Concerning this tree, they fable, that it stands in the palace of Mahomet, though a branch of it will reach to the house of every true believer; that it will be laden with pomegranates, grapes, dates, and other fruit, of surprising bigness, and of tastes unknown to mortals. So that, if a man desire to eat of any particular kind of fruit, it will immediately be presented him; or, if he choose flesh, birds ready dressed will be set before him, according to his wish. They add, that the boughs of this tree will spontaneously bend down to the hand of the person who would gather of its fruits, and that it will supply the blessed not only with food, but also with silken garments, and beasts to ride on ready saddled and bridled, and adorned with rich trappings, which will burst forth from its fruits; and that this tree is so large, that a person, mounted on the fleetest horse, would not be able to gallop from one end of its shade to the other in 100 years.

As plenty of water is one of the greatest additions to the pleasantness of any place, the Koran often speaks of the rivers of paradise as a principal ornament thereof: some of these rivers, they say, flow with water,

M. l'ome-  
tanifin.

some

some with milk, some with wine, and others with honey; all taking their rife from the root of the tree Tuba.

But all these glories will be eclipsed by the resplendent and ravishing girls of paradise, called, from their large black eyes, *Hur al ayan*, the enjoyment of whose company will be a principal felicity of the faithful. These, they say, are created, not of clay, as mortal women are, but of pure milk; being, as their prophet often affirms in his Koran, free from all natural impurities, defects, and inconveniences incident to the sex, of the strictest modesty, and secluded from public view in pavilions of hollow pearls, so large, that as some traditions have it, one of them will be no less than four parasangs (or, as others say, 60 miles) long, and as many broad.

The name which the Mahometans usually give to this happy mansion, is *al Jannat*, or the garden; and sometimes they call it, with an addition, *Jannat al Ferdous*, "the garden of paradise;" *Jannat Eden*, "the garden of Eden," (tho' they generally interpret the word *Eden*, not according to its acceptation in Hebrew, but according to its meaning in their own tongue, wherein it signifies a *settled or perpetual habitation*;) *Jannat al Mawa*, "the garden of abode;" *Jannat al Naim*, "the garden of pleasure;" and the like: by which several appellations, some understand so many different gardens, or at least places of different degrees of felicity, (for they reckon no less than 100 such in all,) the very meanest whereof will afford its inhabitants so many pleasures and delights, that one would conclude they must even sink under them, had not Mahomet declared, that, in order to qualify the blessed for a full enjoyment of them, God will give to every one the abilities of 100 men.

6. God's absolute decree and predestination both of good and evil. The orthodox doctrine is, that whatever hath or shall come to pass in this world, whether it be good, or whether it be bad, proceedeth entirely from the divine will, and is irrevocably fixed and recorded from all eternity in the preserved table. God having secretly predetermined not only the adverse and prosperous fortune of every person in this world, in the most minute particulars, but also his faith or infidelity, his obedience or disobedience, and consequently his everlasting happiness or misery after death; which fate or predestination it is not possible by any foresight or wisdom, to avoid.

Of this doctrine Mahomet makes great use in his Koran for the advancement of his designs; encouraging his followers to fight without fear, and even desperately, for the propagation of their faith, by representing to them, that all their caution could not avert their inevitable destiny, or prolong their lives for a moment; and deterring them from disobeying or rejecting him as an impostor, by setting before them the danger they might thereby incur of being, by the just judgment of God, abandoned to seduction, hardness of heart, and a reprobate mind, as a punishment for their obduracy.

II. *Religious practice.* 1. The first point is *prayer*, under which are also comprehended those legal washings or purifications which are necessary preparations thereto.

Of these purifications there are two degrees, one

called *ghoss*, being a total immersion or bathing of the body in water; and the other called *wudu*, (by the Persians, *abdest*), which is the washing of their faces, hands, and feet, after a certain manner. The first is required in some extraordinary cases only, as after having lain with a woman, or been polluted by emission of seed, or by approaching a dead body; women also being obliged to it after their courses or childbirth. The latter is the ordinary ablution in common cases, and before prayer, and must necessarily be used by every person before he can enter upon that duty. It is performed with certain formal ceremonies, which have been described by some writers, but much easier apprehended by seeing them done, than by the best description.

That his followers might be more punctual in this duty, Mahomet is said to have declared, that *the practice of religion is founded on cleanliness*, which is the *one half of the faith*, and the *key of prayer*, without which it will not be heard by God. That these expressions may be the better understood, *al Ghazali* reckons four degrees of purification; of which the first is the cleansing of the body from all pollution, filth, and excrements; the second, the cleansing of the members of the body from all wickedness and unjust actions; the third, the cleansing the heart from all blameable inclinations and odious vices; and the fourth, the purging a man's secret thoughts from all affections which may divert their attendance on God; adding, that the body is but as the outward shell, in respect to the heart, which is as the kernel.

Circumcision, though it be not so much as once mentioned in the Koran, is yet held, by the Mahometans, to be an ancient divine institution, confirmed by the religion of Islam, and, though not so absolutely necessary but that it may be dispensed with in some cases, yet highly proper and expedient. The Arabs used this rite for many ages before Mahomet, having probably learned it from Ishmael, tho' not only his descendants, but the Hamyarites and other tribes practised the same. The Ishmaelites, we are told, used to circumcise their children, not on the eighth day, as is the custom of the Jews, but when about 12 or 13 years old, at which age their father underwent that operation; and the Mahometans imitate them so far as not to circumcise children before they may be able at least distinctly to pronounce that profession of their faith, *There is no God but God, Mahomet is the apostle of God*; but pitch on what age they please for the purpose, between 6 and 16, or thereabouts.

Prayer was by Mahomet thought so necessary a duty, that he used to call it *the pillar of religion*, and *the key of paradise*; and when the Thakhties, who dwelt at Tayef, lending, in the ninth year of the Hegira, to make their submission to the prophet, after the keeping of their favourite idol had been denied them, begged at least, that they might be dispensed with as to their saying of their appointed prayers, he answered, *That there could be no god in that religion wherein was no prayer*.

That so important a duty, therefore, might not be neglected, Mahomet obliged his followers to pray five times every 24 hours, at certain stated times; viz.

1. In the morning before sun-rise: 2. When noon is past,

paſt, and the ſun begins to decline from the meridian : 3. In the afternoon, before ſun-ſet : 4. In the evening, after ſun-ſet, and before day be ſhut in; and, 5. After the day is ſhut in, and before the firſt watch of the night. For this inſtitution he pretended to have received the divine command from the throne of God himſelf, when he took his night-journey to heaven; and the obſerving of the ſtated times of prayer is frequently inſisted on in the Koran, though they be not particularly preſcribed therein. Accordingly, at the aforeſaid times, of which public notice is given by the Mueddhins, or Criers, from the ſteeple of their mosques, (for they uſe no bells,) every conſcientious Moſlem prepares himſelf for prayer, which he performs either in the mosque or any other place, provided it be clean, after a preſcribed form, and with a certain number of praiſes or ejaculations, (which the more ſcrupulous count by a ſtring of beads) and uſing certain poſtures of worſhip; all which have been particularly ſet down and deſcribed, tho' with ſome few miſtakes, by other writers, and ought not to be a-bridged, unleſs in ſome preſent caſes, as on a journey, on preparing for battle, &c.

For the regular performance of the duty of prayer among the Mahometans, beſides the particulars above-mentioned, it is alſo requiſite that they turn their faces, while they pray, towards the temple of Mecca; the quarter where the ſame is ſituated, being, for that reaſon, pointed out within their mosques by a nich, which they call *al Mehrah*; and without, by the ſituation of the doors opening into the galleries of the ſteeple: there are, alſo, tables calculated for the ready finding out their Kebab, or part towards which they ought to pray, in places where they have no other direction.

2. *Alms* are of two ſorts, *legal* and *voluntary*. The *legal alms* are of indiſpenſable obligation, being commanded by the law, which directs and determines both the portion which is to be given, and of what things it ought to be given; but the *voluntary alms* are left to every one's liberty, to give more or leſs, as he ſhall ſee fit. The former kind of alms ſome think to be properly called *zaca*t, and the latter *ſadaka*; tho' this name be alſo frequently given to the legal alms. They are called *zaca*t, either becauſe they *increate* a man's ſtore by drawing down a bleſſing thereon, and produce in his ſoul the virtue of liberality; or becauſe they *purify* the remaining part of one's ſubſtance from pollution, and the ſoul from the filth of avarice; and *ſadaka*t, becauſe they are a proof of a man's ſincerity in the worſhip of God. Some writers have called the legal alms *tithe*s, but improperly, ſince in ſome caſes they fall ſhort, and in others exceed that proportion.

3. *Faſting* is a duty of ſo great moment, that Mahomet uſed to ſay it was the *gate of religion*, and that the *odour of the mouth of him who faſteth is more grateful to God than that of muſk*; and al Ghazali reckons *faſting one fourth part of the faith*. According to the Mahometan divines, there are three degrees of faſting: 1. The reſtraining the belly and other parts of the body from ſatisfying their luſts; 2. The reſtraining the ears, eyes, tongue, hands, feet, and other members, from ſin; and, 3. The ſubduing the heart from worldly cares, and reſtraining the thoughts from every thing beſides God.

The Mahometans are obliged, by the expreſs command of the Koran, to faſt the whole month of Ramadan, from the time the new-moon firſt appears, till the appearance of the next new moon; during which time they muſt abſtain from eating, drinking, and women, from day-break till night or ſun-ſet. And this injunction they obſerve ſo ſtrictly, that, while they faſt, they ſuffer nothing to enter their mouths, or other parts of their body, ſeeming the faſt broken and null, if they ſmell perfumes, take a clyſter or injection, bathe, or even purpoſely ſwallow their ſpittle; ſome being ſo cautious, that they will not open their mouths to ſpeak, leſt they ſhould breathe the air too freely: the faſt is alſo deemed void, if a man kifs or touch a woman, or if he vomit deſignedly. But after ſun-ſet they are allowed to reſreſh themſelves, and to eat and drink, and enjoy the company of their wives till day-break; though the more rigid begin the faſt again at midnight. This faſt is extremely rigorous and mortifying when the month of Ramadan happens to fall in ſummer, (for the Arabian year being lunar, each month runs thro' all the different ſeaſons in the courſe of 33 years) the length and heat of the days making the obſervance of it much more difficult and uneaſy than in winter.

The reaſon given why the month of Ramadan was pitched on for this purpoſe is, that on that month the Koran was ſent down from heaven. Some pretend, that Abraham, Moſes, and Jeſus, received their reſpective revelations in the ſame month.

4. The pilgrimage to Mecca is ſo neceſſary a point of practice, that, according to a tradition of Mahomet, he who dies without performing it may as well die a Jew or a Chriſtian; and the ſame is expreſsly commanded in the Koran.

The temple of Mecca ſtands in the midſt of the city, and is honoured with the title of *Majdad al Aaram*, i. e. the *ſacred or inviolable temple*. What is principally revered in this place, and gives ſanctity to the whole, is a ſquare ſtone building, called the *CAABA*; (ſee that article).

To this temple every Mahometan, who has health and means ſufficient, ought, once at leaſt in his life, to go on pilgrimage; nor are women excuſed from the performance of this duty. The pilgrims meet at diſſerent places near Mecca, according to the different parts from whence they come, during the months of Shawal and Dhu'lkaada; being obliged to be there by the beginning of Dhu'lhajja; which month, as its name imports, is peculiarly ſet apart for the celebration of this ſolemnity.

At the place above-mentioned the pilgrims properly commence ſuch; when the men put on the Iſram or ſacred habit, which conſiſts only of two woollen wrappers, one wrapped about their middle to cover their privities, and the other thrown over their ſhoulders, having their heads bare, and a kind of ſlippers which cover neither the heel nor the inſtep, and ſo enter the ſacred territory in their way to Mecca. While they have this habit on, they muſt neither hunt nor fowl, (though they are allowed to fiſh;) which precept is ſo punctually obſerved, that they will not kill even a louſe or flea if they find them on their bodies: there are ſome noxious animals, however, which they have permiſſion to kill during the pilgrimage, as kites,

ravens,

ravens, scorpions, mice, and dogs given to bite. During the pilgrimage, it behoves a man to have a constant guard over his words and actions; to avoid all quarrelling or ill-language, all converse with women, and all obscene discourse; and to apply his whole attention to the good work he is engaged in.

The pilgrims, being arrived at Mecca, immediately visit the temple; and then enter on the performance of the prescribed ceremonies, which consist chiefly in going in procession round the Caaba, in running between the mounts Safa and Merwa, in making the station on mount Arafat, and slaying the victims, and shaving their heads in the valley of Mina.

In compassing the Caaba, which they do seven times, beginning at the corner where the black stone is fixed, they use a short quick pace the three first times they go round it, and a grave ordinary pace the four last; which, it is said, was ordered by Mahomet, that his followers might shew themselves strong and active to cut off the hopes of the infidels, who gave out that the immoderate heats of Medina had rendered them weak. But the aforesaid quick pace they are not obliged to use every time they perform this piece of devotion, but only at some particular times. So often as they pass by the black stone, they either kiss it, or touch it with their hand and kiss that.

The running between Safa and Merwa is also performed seven times, partly with a slow pace, and partly running: for they walk gravely till they come to a place between two pillars; and there they run, and afterwards walk again; sometimes looking back, and sometimes stopping, like one who had lost something, to represent Hagar seeking water for her son; for the ceremony is said to be as ancient as her time.

On the ninth of Dhu'l-hajja, after morning-prayer, the pilgrims leave the valley of Mina, whither they come the day before; and proceed in a tumultuous and rushing manner to mount Arafat, where they stay to perform their devotions till sun-set: then they go to Mozdalifa, an oratory between Arafat and Mina; and there spend the night in prayer and reading the Koran. The next morning by day-break they visit *al Massher al Karam*, or "the sacred monument;" and, departing thence before sun-rise, haste by Batn Mohafser to the valley of Mina, where they throw seven stones at three marks or pillars, in imitation of Abraham, who, meeting the devil in that place, and being by him disturbed in his devotions, or tempted to disobedience when he was going to sacrifice his son, was commanded by God to drive him away by throwing stones at him; though others pretend this rite to be as old as Adam, who also put the devil to flight in the same place and by the same means.

This ceremony being over, on the same day, the tenth of Dhu'l-hajja, the pilgrims slay their victims in the said valley of Mina; of which they and their friends eat part, and the rest is given to the poor. These victims must be either sheep, goats, kine, or camels; males, if of either of the two former kinds; and females, if of either of the latter; and of a fit age. The sacrifices being over, they shave their heads and cut their nails, burying them in the same place; after which the pilgrimage is looked on as completed: though they again visit the Caaba, to take their leave of that sacred building.

MAHOMETANS, those who believe in the religion and divine mission of Mahomet. See MAHOMET, MAHOMETANISM, and ALKORAN.

MAIDEN, an instrument for beheading criminals.

Of the use and form of this instrument Mr Pennant gives the following account. "It seems to have been confined to the limits of the forest of Hardwick, or the 18 towns and hamlets within its precincts. The time when this custom took place is unknown; whether Earl Warren, lord of this forest, might have established it among the sanguinary laws then in use against the invaders of the hunting rights, or whether it might not take place after the woollen manufactures at Halifax began to gain strength, is uncertain. The last is very probable; for the wild country around the town was inhabited by a lawless set, whose depredations on the cloth-tenters might soon rouse the efforts of infant industry. For the protection of trade, and for the greater terror of offenders by speedy execution, this custom seems to have been established, so as at last to receive the force of law, which was, 'That if a felon be taken within the liberty of the forest of Hardwick, with goods stolen out, or within the said precincts, either hand-haband, back-berand, or confession'd, to the value of thirteen-pence halfpenny, he shall, after three market-days or meeting-days within the town of Halifax, next after such his apprehension, and being condemned, be taken to the gibbet, and there have his head cut from its body.'

"The offender had always a fair trial; for as soon as he was taken, he was brought to the lord's bailiff at Halifax: he was then exposed on the three markets (which here were held thrice in a week), placed in a stocks, with the goods stolen on his back, or, if the theft was of the cattle kind, they were placed by him; and this was done both to strike terror into others, and to produce new informations against him. The bailiff then summoned four freeholders of each town within the forest to form a jury. The felon and prosecutors were brought face to face; the goods, the cow, or horse, or whatsoever was stolen, produced. If he was found guilty, he was remanded to prison, had a week's time allowed for preparation, and then was conveyed to this spot, where his head was struck off by this machine. I should have premised, that if the criminal, either after apprehension, or in the way to execution, could escape out of the limits of the forest (part being close to the town), the bailiff had no farther power over him; but if he should be caught within the precincts at any time after, he was immediately executed on his former sentence.

"This privilege was very freely used during the reign of Elizabeth: the records before that time were lost. Twenty-five suffered in her reign, and at least twelve from 1623 to 1650; after which I believe the privilege was no more exerted.

"This machine of death is now destroyed; but I saw one of the same kind in a room under the parliament-house at Edinburgh, where it was introduced by the Regent Morton, who took a model of it as he passed through Halifax, and at length suffered by it himself. It is in form of a painter's easel, and about ten feet high: at four feet from the bottom is a cross bar, on which the felon lays his head, which is kept down by another

Mailstone  
&  
Mail.

another placed above. In the inner edges of the frame are grooves; in these is placed a sharp ax, with a vast weight of lead, supported at the very summit with a peg; to that peg is fastened a cord, which the executioner cutting, the ax falls, and does the affair effectually, without suffering the unhappy criminal to undergo a repetition of strokes, as has been the case in the common method. I must add, that if the sufferer is condemned for stealing a horse, or a cow, the string is tied to the beast, which, on being whipped, pulls out the peg, and becomes the executioner."

**MAIDSTONE**, a town of Kent, in England, seated on the river Medway, a branch of which runs through it. It is a large, populous, and agreeable place; and the assizes for the county are held here. It is a corporation, has a free school, and sends two members to parliament. E. Long. O. 37. N. Lat. 51. 20.

**MAIENNE**, a considerable, handsome, and populous town in France, with the title of a duchy; seated on a river of the same name, in W. Long. O. 35. N. Lat. 48. 18.

**MAIGNAN** (Emanuel), a religious minim, and one of the greatest philosophers of his age, was born of an ancient and noble family at Thoulouse in 1601. Like the famous Pascal, he became a complete mathematician without the assistance of a teacher; and filled the professor's chair at Rome in 1636, where, at the expense of Cardinal Spada, he published his book *De Perspectiva Horaria*. He returned to Thoulouse in 1650, and was created provincial: the king, who in 1660 entertained himself with the machines and curiosities in his cell, made him offers by Cardinal Mazarine, to draw him to Paris; but he humbly desired to spend the remainder of his days in a cloyster. He published a course of philosophy, 4 vols 8vo, at Thoulouse; to the second edition of which he added two treatises, one against the vortices of Descartes, and the other on the speaking trumpet invented by Sir Samuel Morland. He is said to have studied even in his sleep, his very dreams being employed in theorems, the demonstrations of which would awaken him with joy. He died in 1676.

**MAJESTY**, a title given to kings, which frequently serves as a term of distinction.—Thus, the emperor is called *Sacred Majesty*, *Imperial Majesty*, and *Cæsarian Majesty*: The king of France is called *His Most Christian Majesty*; and when he treats with the emperor, the word *sacred* is added: And the king of Spain is termed *His Most Catholic Majesty*. With respect to other kings, the name of the kingdom is added; as *His Britannic Majesty*, *His Polish Majesty*, &c. Formerly princes were more sparing in giving titles, and more modest in claiming them: before the reign of Charles V. the king of Spain had only the title of *Highness*; and before that of Henry VIII. the kings of England were only addressed under the titles of *Grace* and *Highness*.

**MAIL INDUCTION**, an ancient custom for the priest and people of country-villages to go in procession to some adjoining wood on a May-day morning; and return in a kind of triumph, with a May-pole, boughs, flowers, garlands, and other tokens of the spring. This *May-game*, or rejoicing at the coming of the spring, was for a long time observed, and still

is in some parts of England; but there was thought to be too much heathen vanity in it, that it was condemned and prohibited within the diocese of Lincoln, by the good old bishop Grotthead.

**MAIL** (*MACULA*), a coat of mail, so called from the French *maille*, which signifies a square figure, or the hole of a net: so *maille de houbereaux* was a coat of mail, because the links or joints in it resemble the squares of a net.

**MAIL** is likewise used for the leather bag wherein letters are carried by the post.

*Action of Mails and Duties*, in Scots law. See *LAW*, p. (90), § 7. and p. (102), § 20.

**MAIM**, *MAIHEM*, or *Mayhem*, in law, a wound by which a person loses the use of a member that might have been a defence to him; as when a bone is broken, a foot, hand, or other member cut off, or an eye put out; though the cutting off an ear or nose, or breaking the hinder-teeth, was formerly held to be no maim. A maim by castration was anciently punished with death, and other maims with loss of member for member; but afterwards they were only punished by fine and imprisonment. It is now enacted by the statute 22 & 23 Car. II. that if any person, from malice, aforethought, shall disable any limb or member of any of the king's subjects with an intent to disfigure him, the offender, with his aiders and abettors, shall be guilty of felony without benefit of clergy; though no such attainer shall corrupt the blood, or occasion forfeiture of lands, &c.

**MAIMBOURG** (Louis), born at Nanci in 1610, became a Jesuit in 1626; and acquired reputation as a teacher, but yet more by the many histories which he published. The Jansenists criticised his history of Arianism, and that of the *Iconoclasts*; and his history of Calvinism, published in 1681, stirred up a violent paper-war against him, the operations whereof he left entirely to his enemies, without giving himself any trouble offensively or defensively. He was degraded by the general of the Jesuits, on account of his having declared too boldly in favour of the Gallican church against the Ultramontains. He retired into the abbey of St Victor, where he died in 1686.

He ought not to be confounded with *Theodore Mainbourg* his cousin; who embraced Calvinism, afterwards returned to the Romish church, returned back to the reformed religion, embraced Socinianism, and died at London about the year 1693, after having published some works.

**MAIMONIDES** (Moses), or **MOSES THE SON OF MAIMON**, a celebrated rabbi, called by the Jews *the eagle of the doctors*, was born of an illustrious family at Cordova in Spain, in 1131. He is commonly named *Moses Egyptian*, because he settled in Egypt, where he spent his whole life in quality of physician to the sultan. Here he opened a school, which was soon filled with pupils from all parts; from Alexandria and Damascus especially, whose proficiency under him spread his fame all over the world. He was no less eminent in philosophy, mathematics, and divinity, than in medicine. Casanbon affirms it may be truly said of him, as Pliny of old said of Diodorus Siculus, that "he was the first of his tribe who ceased to be a trifler." It would be tedious to enumerate all the works of Maimonides; some

Mail  
||  
Maimonides.

some were written originally in Arabic, but are now extant only in Hebrew translations. "Thofe (fays Collier,) who defire to learn the doctrine and the canon law contained in the Talmud, may read Maimonides's compendium of it in good Hebrew, in his book intitled *Iad*; wherein they will find great part of the fables and impertinences in the Talmud entirely difcarded. But the *More Nevochim* is the moft valued of all his works; defigned to explain the obfcure words, phrafes, metaphors, &c. in Scripture, which, when literally interpreted, have either no meaning or appear abfurd.

MAIN, an epithet ufually applied by failors to whatever is principal, as oppofed to whatever is inferior or fecondary. Thus the main land is ufed in contradiftinction to an ifland or peninfula; and the main-maft, the main-wale, the main-keel, and the main-hatchway, are in like manner diftinguifhed from the fore and mizen mafts, the channel-wales, the falfe keel, and the fore and after hatchways, &c.

MAINOUR, MANOUR, or MEINOUR, (from the French *manier*, i. e. *manu tradere*), in a legal fenfe denotes the thing that a thief taketh away or ftealeth: As to be taken with the *mainour*, (*Pl. Cor. fol. 179.*) is to be taken with the thing ftolen about him: And again (*fol. 194.*) it was prefented, that a thief was delivered to the fheriff or vifcount, together with the *mainour*: And again, (*fol. 186.*) if a man be indicted, that he feloniously ftole the goods of another, where, in truth, they are his own goods, and the goods he brought into the court as the *mainour*; and if it be demanded of him, what he faith to the goods, and he difclaim them; though he be acquitted of the felony, he fhall lofe the goods: And again, (*fol. 149.*) if the defendant were taken with the *manour*, and the *manour* be carried to the court, they, in ancient times would arraign him upon the *manour*, without any appeal or indictment. *Covel. See Blackft. Comment. Vol. III. 71. Vol. IV. 303.*

MAINPRIZE. *See Falfc IMPRISONNENT.*

The writ of mainprize, *manu capio*, is a writ directed to the fheriff, (either generally, when any man is imprifoned for a bailable offence, and bail hath been refufed; or fpecially, when the offence or caufe of commitment is not properly bailable below), commanding him to take fureties for the prifoner's appearance, ufually called *mainpernors*, and to fet him at large. Mainpernors differ from bail, in that a man's bail may imprifon, or furrender him up before the ftipulated day of appearance; mainpernors can do neither, but are barely fureties for his appearance at the day: bail are only fureties that the parties be anfwerable for the fpecial matter for which they ftipulate, mainpernors are bound to produce him to anfwer all charges whatever. *See HABEAS CORPUS.*

MAINTENANCE, in law, bears a near relation to BARRETRY; being an officious intermeddling in a fuit that no way belongs to one, by maintaining or affifting either party with money or otherwife, to profecute or defend it: a practice that was greatly encouraged by the firft introduction of ufes. This is an offence againft public juftice, as it keeps alive ftrengh and contention, and perverts the remedial procefs of the law into an engine of oppreffion. And therefore, by the Roman law, it was a fpecies of the *crimen falſi*,

to enter into any confederacy, or do any aft to fupport another's law-fuit, by money, witneffes, or patronage. A man may, however, maintain the fuit of his near kinfman, fervant, or poor neighbour, out of charity and compaffion, with impunity. Otherwife the punifhment by common law is fine and imprifonment; and by the ftatute 32 Hen. VIII. c. 9. a forfeiture of 101.

MAINTENON (Madame de), a French lady of extraordinary fortune, defended from an ancient family, and whofe proper name was *Frances Daubigne*, was born in 1635. Her parents by miffortunes being ill able to fupport her, ſhe fell to the care of her mother's relations; to efcape which ftate of dependence, ſhe was induced to marry that famous old buffoon the abbe Scarron, who fubfifted himſelf only on a penſion allowed him by the court for his wit and parts. She lived with him many years, which Voltaire makes no ſcruple to call the happieft years of her life; but when he died in 1660, ſhe found herſelf as indigent as ſhe was before her marriage. Her friends indeed endeavoured to get her husband's penſion continued to her, and prefented fo many petitions to the king about it, all beginning with "The widow Scarron moft humbly prays your majeſty's, &c." that he was quite weary of them, and has been heard to exclaim, "Muſt I always be pelted with the widow Scarron?" At laſt, however, through the recommendation of Madame de Montſpan, he fettled a much larger penſion on her, with a genteel apology for making her wait fo long; and afterward made choice of her to take care of the education of the young duke of Maine, his fon by Madame de Montſpan. The letters ſhe wrote on this occaſion charmed the king, and were the origin of her advancement; her perſonal merit effected all the reſt. He bought her the lands of Maintenon, the only eſtate ſhe ever had; and finding her pleaſed with the acquiſition, called her publicly *Madam de Maintenon*; which was of great ſervice to her in her good fortune, by releaſing her from the ridicule attending that of Scarron. Her elevation was to her only a retreat; the king came to her apartment every day after dinner, before and after ſupper, and continued there till midnight: here he did buſineſs with his miniſters, while Madame de Maintenon, employed in reading or needle-work, never ſhewed any deſire to talk of ſtate-affairs, and carefully avoided all appearance of cabal or intrigue; ſhe did not even make uſe of her power to dignify her own relations. About the latter end of the year 1685, Lewis XIV. married her, he being then in his 48th and ſhe in her 50th year; and that piety with which ſhe inſpired the king to make her a wife inſtead of a miſtreſs, became by degrees a fettled diſpoſition of mind. She prevailed on Lewis to found a religious community at St Cyr, for the education of 300 young ladies of quality; and here ſhe frequently retired from that melancholy of which the complaints ſo pathetically in one of her letters, and which few ladies will ſuppoſe ſhe ſhould be liable to in ſuch an elevated ſituation. But, as M. Voltaire ſays, if any thing could ſhew the vanity of ambition, it would certainly be this letter. Madame de Maintenon could have no other unſelfneſs than the uniformity of her manner of living with a great king; and this made her once ſay to the count Daubigné her brother, "I can hold it no lon-

Major. ger; I wish I was dead." The answer he made to her was, "You have then a promise to marry the Almighty?" Lewis, however, died before her in 1715; when she retired wholly to St Cyr, and spent the rest of her days in acts of devotion; and what is most surprising is, that her husband left no certain provision for her, recommending her only to the duke of Orleans. She would accept no more than a pension of 80,000 livres, which was punctually paid till she died in 1719. A collection of her letters has been published, and translated into English; from which familiar intercourse her character will be better known than from description.

MAJOR, in the art of war, the name of several officers of very different ranks and functions.

Major of a *regiment of Foot*, the next officer to the lieutenant-colonel, generally promoted from the eldest captain: he is to take care that the regiment be well exercised, to see it march in good order, and to rally it in case of being broke in action: he is the only officer among the infantry that is allowed to be on horseback in time of action, that he may the more readily execute the colonel's orders.

Major of a *regiment of Horse*, as well as foot, ought to be a man of honour, integrity, understanding, courage, activity, experience, and address: he should be master of arithmetic, and keep a detail of the regiment in every particular: he should be skilled in horsemanship, and ever attentive to his business: one of his principal functions is, to keep an exact roster of the officers for duty: he should have a perfect knowledge in all the military evolutions, as he is obliged by his post to instruct others, &c.

*Town-Major*, the third officer in order in a garrison, and next to the deputy-governor. He should understand fortification, and has a particular charge of the guards, rounds, patrols, and sentinels.

*Brigade-Major*, is a particular officer appointed for that purpose only in camp: he goes every day to head-quarters to receive orders from the adjutant-general: there they write exactly whatever is dictated to them: from thence they go and give the orders, at the place appointed for that purpose, to the different majors or adjutants of the regiments which compose that brigade, and regulate with them the number of officers and men which each are to furnish for the duty of the army: taking care to keep an exact roster, that one may not give more than another, and that each march in their tour: in short, the major of brigade is charged with the particular detail in his own brigade, in much the same way as the adjutant-general is charged with the general detail of the duty of the army. He sends every morning to the adjutant-general an exact return, by battalion and company, of the men of his brigade missing at the retreat, or a report expressing that none are absent: he also mentions the officers absent with or without leave.

As all orders pass through the hands of the majors of brigade, they have infinite occasions of making known their talents and exactness.

Major of *Artillery*, is also the next officer to the lieutenant-colonel. His post is very laborious, as the whole detail of the corps particularly rests with him; and for this reason all the non-commissioned officers are subordinate him, as his title of *serjeant-major* im-

ports: in this quality they must render him an exact account of every thing which comes to their knowledge, either regarding the duty or wants of the artillery and fildiers. He should possess a perfect knowledge of the power of artillery, together with all its evolutions. In the field he goes daily to receive orders from the brigade-major, and communicates them with the parole to his superiors, and then dictates them to the adjutant. He should be a very good mathematician, and be well acquainted with every thing belonging to the train of artillery, &c.

MAJOR of *Engineers*, commonly with us called *sub-director*, should be very well skilled in military architecture, fortification, gunnery, and mining. He should know how to fortify in the field, to attack and defend all sorts of posts, and to conduct the works in a siege, &c. See *ENGINEER*.

*Aid-Major*, is on sundry occasions appointed to act as major, who has a pre-eminence above others of the same denomination. Our horse and foot-guards have their guidons, or second and third majors.

*Serjeant-Major*, is a non-commissioned officer, of great merit and capacity, subordinate to the adjutant, as he is to the major. See *SERGEANT*.

*Drum-Major*, is not only the first drummer in the regiment, but has the same authority over his drummers as the corporal has over his squad. He instructs them in their different beats; is daily at orders with the serjeants, to know the number of drummers for duty. He marches at their head when they beat in a body. In the day of battle, or at exercise, he must be very attentive to the orders given him, that he may regulate his beats according to the movements ordered.

*Fife-Major*, is he that plays the belt on that instrument, and has the same authority over the fifers as the drum-major has over the drummers. He teaches them their duty, and appoints them for guards, &c.

MAJOR, in law, a person who is of age to manage his own affairs. By the civil law a man is not a major till the age of 25 years; in England, he is a major at 21, as in Normandy at 20.

MAJOR, in logic, is understood of the first proposition of a regular syllogism. It is called *major*, because it has a more extensive sense than the minor proposition, as containing the principal term. See *LOGIC*.

MAJOR and *Minor*, in music, are applied to concords which differ from each other by a semi-tone. See *CONCORD*.

Major tone is the difference between the fifth and fourth; and major semi-tone the difference between the major fourth and the third. The major tone surpasses the minor by a comma.

MAJOR-Demo, an appellation formerly given to the steward or master of the king's household.

MAJOR (John), a scholastic divine and historian, was born at Haddington, in the province of East Lothian in Scotland. It appears from some passages in his writings, that he resided a while both at Oxford and Cambridge. He went to Paris in 1493, and studied in the college of St Barbe, under the famous John Bonlac. Thence he removed to that of Montacute, where he began to study divinity under the celebrated Standouk. In the year 1498, he was entered of the college of Navarre. In 1505, he was created doctor divinity; returned to Scotland in 1519, and taught theology

Major,  
Majorca.

theology during several years in the university of St Andrews. But at length, being disgusted with the quarrels of his countrymen, he went back to Paris, and resumed his lectures in the college of Montacute, where he had several pupils, who afterwards became men of great eminence. About the year 1530, he returned once more to Scotland, and was chosen professor of theology at St Andrew's, of which he afterwards became provost; and there died in 1547, aged 78. His logical treatises form one immense folio; his commentary on Aristotle's physics makes another; and his theological works amount to several volumes of the same size. The masses of crude and useless disquisition, were the admiration of his contemporaries. A work, less prized in his own age, was to make him known to posterity. His book *De Gestis Scotorum*, was first published at Paris by Badius Ascensius, in the year 1521. He rejects in it some of the fictions of former historians; and would have had greater merit if he had rejected more. He intermingles the history of England with that of Scotland; and has incurred the censure of some partial writers, for giving an authority to the authors of the former nation, which he refuses to those of his own. Bede, Caxton, and Froissard, were exceedingly useful to him. What does the greatest honour to this author is, the freedom with which he has censured the rapacity and indolence of ecclesiastics, and the train of ridicule with which he treats the pope's supremacy. The style in which he wrote does not deserve commendation. Bishop Spotiswood calls it *Sorbonnic and barbarous*.

MAJORCA, an island of the Mediterranean, lying between Yvica on the west and Minorca on the east. These three islands were anciently called *Baleares*, supposed to be from the skill of their inhabitants in slinging, for which they were very remarkable. Originally they belonged to the Carthaginians; but during the wars of that people with the Romans, they seem to have regained their liberty. In 122 B. C. they were subdued by Metellus the Roman consul, who treated the inhabitants with such cruelty, that out of 30,000 he scarce left 1000 alive. He then built two cities on Majorca; one called *Palma*, now *Majorca*, to the east; the other to the west, named *Pollentia*, now no longer in being. The island continued subject to the Romans, and to the nations who over-ran the western part of the empire, for many ages. At last it was subdued by the Moors about the year 800. By them the island was put in a much better condition than it ever was before or since. The Moors being very industrious, and also populous, surrounded the whole coast with fortifications, that is, with a kind of towers and lines between them; cultivated every spot in the island that was not either rock or sand; and had no fewer than 15 great towns, whereas now there are not above three. Neither was it at all difficult for the Moorish monarch to bring into the field an army much superior in number to the inhabitants that are now upon it, taking in all ranks, sexes, and ages. In 1229, the island was subdued by the king of Arragon, who established in it a new kingdom feudatory to that of Arragon, which was again destroyed in 1341 by the same monarchs; and ever since, the island hath been subject to Spain, and hath entirely lost its importance. It is about 60 miles long, and 45 broad. The air is clear

and temperate, and, by its situation, the heat in summer is so qualified by the breezes, that it is by far the most pleasant of all the islands in the Mediterranean. There are some mountains; but the country is generally flat, and of such an excellent soil, that it produces great quantities of corn as good in its kind as any in Europe. Oil, wine, and salt, are very plentiful, as also black cattle and sheep; but deer, rabbits, and wild-fowl, abound so much, that they alone are sufficient for the subsistence of the inhabitants. There are no rivers, but a great many springs and wells, as well as several good harbours. The inhabitants are robust, active, and good seamen.

MAJORCA, a handsome, large, rich, and strong town, in the island of the same name, with a bishop's see. It contains about 6000 houses, and 22 churches, besides the cathedral. The squares, the cathedral, and the royal palace, are magnificent structures. A captain-general resides there, who commands the whole island; and there is a garrison against the incursion of the Moors. It was taken by the English in 1706; but was retaken in 1715, since which time it has been in the hands of the Spaniards. It is seated on the south-west part of the island, where there is a good harbour, 70 miles north-east of Yvica, 120 south-east of Barcelona, 140 east of Valencia, and 300 from Madrid. E. Long 2. 55. N. Lat. 39. 36.

MAIRE (Streights le), a passage to Cape Horn, situated between Terra del Fuego and Staten Island; which, being discovered by Le Maire, obtained his name. It is now, however, less made use of than formerly, ships going round Staten Island as well as Terra del Fuego.

MAITLAND (John), Lord Thyrlestone, chancellor of Scotland, was the son of Richard Maitland of Lethingtoun, and brother to secretary Lethingtoun. He was born in the year 1545, educated in Scotland, and was afterwards sent to France to study the law. On his return to his native country, he commenced advocate; in which profession his abilities became so eminently conspicuous, that in the year 1584, he was made secretary of state to king James VI. and, on the death of the earl of Arran, the year following, created lord high chancellor of Scotland.

The chancellor's power and influence created him many enemies among the Scots nobility, who made several attempts to destroy him, but without success. In 1589, he attended the king on his voyage to Norway, where his bride, the princess of Denmark, was detained by contrary wind. The marriage was immediately consummated, and they returned with the queen to Copenhagen, where they spent the ensuing winter. During their residence in Denmark, the chancellor became intimately acquainted with the celebrated Tycho Brahe.

Towards the end of the year 1592, the chancellor incurred the queen's displeasure, for refusing to relinquish his lordship of Musselburgh, which he claimed as being a part of Dumfermline. He absented himself for some time from court; but was at length restored to favour, and died of a lingering illness in the year 1595, much regretted by the king. Spotiswood and Johnston give him the character of a man of great learning and political abilities. His epigrams are printed in *Del. Poet. Scot.* vol. ii.

Majorca  
Maitland.

MAIZE, or INDIAN CORN. See ZEA.

MAKI. See LEMUR.

MALABAR, the name given to a great part of the west coast of the peninsula, on this side of the Ganges, from the kingdom of Baglala to Cape Comorin, or only from the north extremity of the kingdom of Canara as far as Cape Comorin. It is bounded by the mountains of Balligate on the east; by Decan on the north; and on the west and south is washed by the Indian sea.

MALACCA, the most southerly part of the great peninsula beyond the Ganges, is about 600 miles in length, and contains a kingdom of the same name. It is bounded by the kingdom of Siam on the north; by the bay of Siam and the Indian ocean, on the east; and by the freights of Malacca, which separate it from the island of Sumatra, on the south-west. This country is more to the south than any other in the East Indies; and comprehends the towns and kingdoms of Patan, Pahan, Igohor, Pera, Queda, Borkelon, Ligor; and to the north the town and kingdom of Tanassery, where the Portuguese formerly carried on a great trade. This last either does or did belong to the king of Siam. The people of Malacca are in general subject to the Dutch, who possess all the strong places on the coast, and compel them to trade on their own terms, excluding all other nations of Europe from having any commerce with the natives.

The Malays are governed by feudal laws. A chief, who has the title of *king* or *sultan*, issues his commands to his great vassals, who have other vassals in subjection to them in a similar manner. A small part of the nation live independent, under the title of *oranicai* or *noble*, and sell their services to those who pay them best; while the body of the nation is composed of slaves, and live in perpetual servitude.

The generality of these people are restless, fond of navigation, war, plunder, emigrations, colonies, desperate enterprizes, adventures, and gallantry. They talk incessantly of their honour, and their bravery; whilst they are universally considered by those with whom they have intercourse, as the most treacherous, ferocious people on earth. This ferocity, which the Malays qualify under the name of *courage*, is so well known to the European companies who have settlements in the Indies, that they have universally agreed in prohibiting the captains of their ships who may put into the Malay islands, from taking on board any seamen from that nation, except in the greatest distress, and then on no account to exceed two or three. It is not in the least uncommon for an handful of these horrid savages suddenly to embark, attack a vessel by surprise, massacre the people, and make themselves master of her. Malay bateaux, with 24 or 30 men, have been known to board European ships of 30 or 40 guns, in order to take possession of them, and murder with their poignards great part of the crew. Those, who are not slaves, go always armed: they would think themselves disgraced if they went abroad without their poignards, which they call *crit*. As their lives are a perpetual round of agitation and tumult, they cannot endure the long flowing garments in use among the other Asiatics. Their habits are exactly adapted to their shapes, and loaded with a multitude

of buttons, which fasten them close to their bodies.

The country possessed by the Malays is in general very fertile. It abounds with odoriferous woods, such as the aloes, the sandal, and the cassia. The ground is covered with flowers of the greatest fragrance, of which there is a perpetual succession throughout the year. There are abundance of mines of the most precious metals, said to be richer even than those of Brazil or Peru, and in some places are mines of diamonds. The sea also abounds with excellent fish, together with ambergrease, pearls, and those delicate birds-nests so much in request in China, formed in the rocks with the spawn of fishes, and the foam of the sea, by a species of small-sized swallow peculiar to those seas. These are of such an exquisite flavour, that the Chinese for a long time purchased them for their weight in gold, and still buy them at an excessive price. See BIRDS-NESTS.

Notwithstanding all this plenty, however, the Malays are miserable. The culture of the lands, abandoned to slaves, is fallen into contempt. These wretched labourers, dragged incessantly from their rustic employments by their restless masters, who delight in war and maritime enterprizes, have never time or resolution to give the necessary attention to the labouring of their grounds; of consequence the lands for the most part are uncultivated, and produce no kind of grain for the subsistence of the inhabitants. The fago tree indeed supplies in part the defect of grain. It is a species of the palm-tree, which grows naturally in the woods to the height of about 20 or 30 feet; its circumference being sometimes from five to six. Its ligneous bark is about an inch in thickness, and covers a multitude of long fibres, which being interwoven one with another envelope a mass of a gummy kind of meal. As soon as this tree is ripe, a whitish dunt, which transpires thro' the pores of the leaves, and adheres to their extremities, indicates that the trees are in a state of maturity. The Malays then cut them down near the root, divide them into several sections, which they split into quarters: they then scoop out the mass of mealy substance, which is enveloped by and adheres to the fibres; they dilute it in pure water, and then pass it through a straining bag of fine cloth, in order to separate it from the fibres. When this paste has lost part of its moisture by evaporation, the Malays throw it into a kind of earthen vessel of different shapes, where they allow it to dry and harden. Their paste is wholesome nourishing food, and preserves for many years.

MALACCA, the capital of the country of the same name, is situated in a flat country close to the sea. The walls and fortifications are founded on a solid rock, and are carried up to a great height; the lower part of them is washed by the sea at every tide, and on the land-side is a wide canal or ditch, cut from the sea to the river, which makes it an island. In 1641 it was taken from the Portuguese by the Dutch, since which time it has continued in their possession. In this city there are a great many broad streets; but they are very badly paved. The houses are tolerably well built, and some of them have gardens behind or on one side. The inhabitants consist of a few Dutch, many Malaysians, Moors, Chinese, and other Indians, who are kept in awe by a fortress, which is separated from

Malachi  
Maldonat.

from the city by a river, and by good walls and bastions, as well as by strong gates, and a draw-bridge that is on the eastern side. The city is well situated for trade and navigation. E. Long. 102. 2. N. Lat. 2. 12.

**MALACHI**, or the prophecy of **MALACHI**, a canonical book of the Old Testament, and the last of the 12 lesser prophets. Malachi prophesied about 300 years before Christ, reproving the Jews for their wickedness after their return from Babylon, charging them with rebellion, sacrilege, adultery, profaneness, and infidelity; and condemning the priests for being scandalously careless in their ministry: at the same time not forgetting to encourage the pious few, who, in that corrupt age, maintained their integrity. This prophet distinctly points at the Messiah, who was suddenly to come to his temple, and to be introduced by Elijah the prophet, that is, by John the Baptist, who came in the spirit and power of Elias, or Elijah.

**MALACIA**, in medicine, is a languishing disorder incident to pregnant women, in which they long sometimes for one kind of food and sometimes for another, and eat it with extraordinary greediness.

**MALACOPTERYGEOUS**, among ichthyologists, an appellation given to such fishes as have the rays of their fins bony, but not pointed or sharp at the extremities like those of *ancanthopterygeous* fishes.

**MALACOSTOMOUS** FISHES, those destitute of teeth in the jaws, called in English *leather-mouthed*, as the tench, carp, bream, &c.

**MALAGA**, an ancient, rich, and strong town of Spain, in the kingdom of Grenada, with two castles, a bishop's see, and a good harbour, which renders it a trading place. It is frequented by the English and Dutch, who bring their vessels there to load them with fruits and wine. It is seated on the Mediterranean sea, at the foot of a craggy mountain. E. Long. 4. 56. N. Lat. 36. 51.

**MALAGMA**, a cataplasm. See **CATAPLASM**.

**MALDIVIA** ISLANDS, a cluster of small islands in the Indian ocean, 500 miles south-west of the continent of the island of Ceylon. They are about 1000 in number, and are very small; extending from the second degree of south latitude to the seventh degree north latitude. They are generally black low lands, surrounded by rocks and sands. The natives are of the same complexion with the Arabians, profess the Mahometan religion, and are subject to one sovereign. The channels between the islands are very narrow, and some of them are fordable. They produce neither rice, corn, nor herbage; but the natives live upon coconuts, and other fruits, roots, and fish. They have little or nothing to barter with, unless the shells called *cowry*, or *blackmore's teeth*, with which they abound; and these serve instead of small coin in many parts of India.

**MALDONAT** (John), a Spanish Jesuit born in 1534, was accused of heresy, and of procuring a fraudulent will in seducing the president de St Andre at Paris to bequeath his estate to the Jesuits. Peter Condi acquitted him of the first charge, and the parliament of Paris of the other. He retired after these troubles to Bourges, but went to Rome by order of pope Gregory XIII. to take care of the publication of the Septuagint; and there, finishing his commen-

tary on the gospels in 1582, he died in the beginning of the following year. He wrote, besides, Commentaries on Jeremish, Baruch, Ezekiel, and Daniel; a treatise on the sacraments, on grace, on original sin; and several other pieces printed at Paris in 1677, in folio. His style is clear, lively, and easy. He does not fervently follow the scholastic divines; but is pretty free, and sometimes singular, in his sentiments.

**MALE**, among zoologists, that sex of animals which has the parts of generation situated externally. See **SEX** and **GENERATION**.

The term *male* has also, from some similitude to that sex in animals, been applied to several inanimate things; thus we say, a male flower, a male screw, &c. See *Mas Planta*, *MASCULUS Flor*, and *SCREW*; also *FEMALE* and *FLOS*.

**MALEBRANCHE** (Nicholas), an eminent French metaphysician, the son of Nicholas Malebranche, secretary to the French king, was born in 1638, and admitted into the congregation of the oratory in 1660. He at first applied himself to the study of languages and history: but afterwards meeting with Des Cartes's *Treatise of Man*, he gave himself up entirely to the study of philosophy. In 1699, he was admitted an honorary member of the Royal Academy of Sciences at Paris. Notwithstanding he was of a delicate constitution, he enjoyed a pretty good state of health till his death, which happened in 1715, at the age of 77. Father Malebranche read little, but thought a great deal. He despised that kind of philosophy which consists only in knowing the opinions of other men, since a person may know the history of other men's thoughts without thinking himself. He could never read ten verses together without disgust. He meditated with his windows shut, in order to keep out the light, which he found to be a disturbance to him. His conversation turned upon the same subjects as his books; but was mixed with so much modesty and deference to the judgment of others, that it was extremely and universally desired. His books are famous; particularly his *Recherche de la Verite*, i. e. Search after truth: his design in which is, to point to us the errors in which we are daily led by our senses, imagination, and passions; and to prescribe a method for discovering the truth, which he does, by starting the notion of seeing all things in God. And hence he is led to think and speak merely of human knowledge, either as it lies in written books, or in the book of nature, compared with that light which displays itself from the ideal world; and by attending to which, with pure and defecated minds, he supposes knowledge to be most easily had. The fineness of this author's sentiments, together with his fine manner of expressing them, made every body admire his genius and abilities; but he has generally passed for a visionary philosopher. Mr Locke, in his examination of Malebranche's opinion of seeing all things in God, styles him an acute and ingenious author; and tells us, that there are "a great many very fine thoughts, judicious reasonings, and uncommon reflections, in his *Recherche*." But Mr Locke, in that piece, endeavours to refute the chief principles of his system. He wrote many other pieces besides what we have mentioned, all tending some way or other to confirm his main system, established in the

Male,  
Malebranche.

Malherbe

Mallet.

*Recherche*, and to clear it from the objections which were brought against it, or from the consequence which were deduced from it: and if he has not attained what he aimed at in these several productions, he has certainly shown great abilities, and a vast force of genius.

MALHERBE (Francis de), the best French poet of his time, was born at Caen about the year 1556, of a noble and ancient family. He quitted Normandy at 17 years of age; and went into Provence, where he attached himself to the family of Henry Angouleme, the natural son of king Henry II. and was in the service of that prince till he was killed by Altoviti in 1586. At length cardinal de Perron, being informed of his merit and abilities, introduced him to Hen. IV. who took him into his service. After that monarch's death, queen Mary de Medicis settled a pension of 500 crowns upon our poet, who died at Paris in 1628. The best and most complete edition of his poetical works is that of 1666, with Menage's remarks. Malherbe so far excelled all the French poets who preceded him, that Boileau considers him as the father of French poetry: but he composed with great difficulty, and put his mind on the rack, in correcting what he wrote. He was a man of a singular humour, blunt in his behaviour, and without religion. When the poor used to promise him, that he would pray to God for him, he answered them, that "he did not believe they could have any great interest in heaven, since they were left in such a bad condition upon earth; and that he should be better pleased if the duke de Luynes, or some other favourite, had made him the same promise." He would often say that "the religion of gentlemen was that of their price." During his last sickness he had much ado to resolve to confess to a priest; for which he gave this facetious reason, that "he never used to confess but at Easter." And some few moments before his death, when he had been in a lethargy two hours, he awaked on a sudden to reprove his landlady, who waited on him, for using a word that was not good French; saying to his confessor who reprimanded him for it, that "he could not help it, and he would defend the purity of the French language to the last moment of his life."

MALIGNANT, among physicians, a term applied to diseases of a very dangerous nature, and generally infectious; such are the dysentery, hospital-fever, &c. in their worst stages.

Malignity among physicians signifies much the same with contagion. See CONTAGION.

MALL, SEA-MALL, or *Sea-mew*, in ornithology. See LARUS.

MALLARD, in ornithology. See ANAS.

MALLEABLE, a property of metals whereby they are capable of being extended under the hammer.

MALLENDERS, in farrery. See there, § xxxiii.

MALLETT, (David, Esq;) a North-Briton, was tutor to the duke of Montrose, and to his brother lord George Graham; and became secretary to the late prince of Wales. He married a lady of very considerable fortune, and was made keeper of the book of entries for ships in the port of London. He died in 1765.

He was the editor of a new and complete edition

of lord Bacon's works, to which he prefixed a life of that great man; and published the philosophical works of the late lord Bolinbroke, agreeable to his lordship's last will and testament. His dramatic pieces are, 1. *Eurydice*, a tragedy. 2. *Mutapha*, a tragedy. 3. *Alfred*, a masque; written in conjunction with Mr James Thomson, author of the *Seasons*. *Britannia*, a masque, 1775. 5. *Elvira*, a tragedy, altered from La Motte; who founded this play on the famous story of Agnes de Castro, which Camoens has so beautifully introduced in his *Lusiad*.—Mr Mallet's tragedy was acted with moderate applause at Drury-Lane play-house in January 1763. The indifferent success it met with may, in part, be ascribed to the unlucky juncture in which it appeared; at a time when party-prejudice ran high against the Scottish nation, on account of the unpopular administration of the earl of Bute, to whom *Elvira* was dedicated.

Mr Mallet's other works are collected in 3 vols 12mo; among which the most considerable are, 1. *That sweet ballad intitled William and Margaret*. 2. *The Excursion*, a poem in two cantos. 3. *Amyntor and Theodora*, or the *Hermit*.—This last piece was originally intended for the stage, but the author chose afterwards to alter his plan. There was likewise an additional collection of poems by the author, published in 1762, in a thin volume octavo, consisting of small pieces on several occasions.

MALLEVILLE (Claude de), a French poet, born at Paris, was one of the first members of the French academy, and gained a prize from Voiture and other ingenious men. He became secretary to M. de Bassompierre, to whom he performed important services while he was in prison; and with the rewards he received for them he purchased the place of secretary to the king. He was likewise secretary to the French academy, and died in 1647. He wrote sonnets, stanzas, elegies, epigrams, songs, madrigals, and a paraphrase on some of the *Psalms*. His sonnets are most esteemed.

MALLICOLLO, one of the new Hebrides islands in the south-sea, and the most considerable of them all next to *Espiritu Santo*. It is 18 leagues long from south-east to north-west; its greatest breadth, which is at the south-east end, is eight leagues; the north-west end is two-thirds its breadth, and narrower in the middle one-third. This contraction is occasioned by a wide and deep bay on the south-west side. It appears to be very fertile, and well inhabited; the land on the sea-coast is rather low, and lies with a greater slope from the hills which are in the middle of the island: latitude 16 deg. 28 min. south; 167 deg. 56 min. east. On inquiring of the natives the name of this island, they were answered that it was Mallicollo, which has a near resemblance to Manicollo, the name which Quiros received for it 160 years before. He did not indeed visit the island, but had his intelligence from the natives.

The south coast, which was most attentively examined by captain Cook, is luxuriantly clothed with wood and other vegetables, from the sea-shore to the very summits of the hills. To the north-west, the country is less woody, but more agreeably intersected by lawns, some of which appeared to be cultivated. The vegetable productions of this country seemed to be

Mallet

Mallicollo.

Mallicollo. be in great variety; cocoa-nuts, bread-fruit, bananas, sugar-canes, yams, eddoes and turmeric: but captain Cook thought the fruits here not so good as at the Society and Friendly Isles. Hogs, and common poultry, are their domestic animals; and as the frequent squeaking of pigs was heard in the woods, it was concluded that the former are in considerable numbers here. A brace of Tahitian puppies was given them, with a view to stock the country with that species of animal: these they received with strong signs of satisfaction. The woods appeared to be inhabited by many species of birds. Here was caught a shark, which measured nine feet in length, on which the ship's company feasted with great relish: this shark, when cut open, was found to have the bony point of an arrow sticking in its head, having been shot quite through the skull. The wound was healed so perfectly, that not the smallest vestige of it appeared on the outside: a piece of the wood still remained sticking to the bony point, as well as a few fibres with which it had been tied on; but both the wood and the fibres were so rotted, as to crumble into dust at the touch. Two large reddish fish of the sea-bream kind were likewise caught, on which most of the officers and some of the petty officers dined the next day. The night following every one who had eaten of them was seized with violent pains in the head and bones, attended with a scorching heat all over the skin, and numbness in the joints; even such hogs and dogs as had partaken of these fish, gave strong symptoms of being poisoned: one hog, who had eaten of the garbage, swelled to a great size, and died at night: several dogs were affected in the same manner; they groaned most piteously, had violent twitchings, and could hardly drag their limbs along. These fish were supposed to have been of the same sort with those which Quiros mentions to have produced similar effects on board his ship, and which he calls *pargos*, which is the Spanish name for the sea-bream. Perhaps these fish are not always poisonous; but, like many species in the West and East-Indies, may acquire that quality by feeding on poisonous vegetables: which conclusion is supported by the circumstance of the intestines have been found to be more poisonous than the rest. The effects of this poison on the officers continued for near a fortnight, during which time their pains returned every night, their teeth were loose, and their gums and palate excoriated.

The natives of Mallicollo are described as the most ugly, ill-proportioned people imaginable, and in every respect different from the other islanders in the South-Sea: they are of a very dark colour, and diminutive size; with long heads, flat faces, and monkey countenances; their hair, in general, black or brown, short and curly, but not quite so soft and woolly as that of a negro. Their beards are very strong, crisp, and bushy, and generally black and short. But what serves greatly to increase their natural deformity is, a custom which they have of wearing a belt, or cord, round their waist: this rope is as thick as a man's finger; and is tied so tight round their belly, that it would be fatal to a person unaccustomed from infancy to such an unnatural ligature; for it cuts such a deep notch across the navel, that the belly seems in a manner divided, one part being above and the other below the rope. The

men go quite naked, except a piece of cloth, or leaf, Mallicollo. used as a wrapper. Most other nations invent some kind of covering from motives of shame; but here a roll of cloth, continually fastened to the belt, rather displays than conceals, and is the opposite of modesty. Besides having the flat broad nose and projecting cheek-bones of a negro, and a very short forehead, many increased their natural ugliness, by painting their faces and breasts with a black colour. Some few had a small cap on the head made of matted-work. They wear bracelets of white and black shells, which press the upper arm so closely, that they have been put on when the wearer was very young: this tends, as well as the belt, to reduce the Mallicollese to that slender shape which characterises them. The depression of their foreheads is supposed to be artificial, as the heads of infants may be squeezed into any kind of form.

The first natives that were seen carried clubs in their hands, and waded into the water, carrying green boughs, the universal sign of peace. In a day's time they ventured to come within a few yards of the ship's boat, which was sent out; when they dipped their hands to the sea, and gathering some water in their palms, poured it on their heads. The officers in the boat, in compliance with their example, did the same, with which the Indians appeared to be much pleased. They repeated the word *tomarr*, or *tomarro*, continually; which seemed to be an expression among them equivalent to *ayo* among the Society-Islands. The greater part were now armed with bows and arrows, and a few with spears. At length they ventured near the ship, and received a few presents of Tahitian cloth, which they eagerly accepted, and handed up their arrows in exchange, some of which were pointed with wood, and some with bone, and daubed with a black gummy stuff which was supposed to be poisoned; but its effects were tried on a dog, without producing any dangerous symptoms. They continued about the ship, talking with great vociferation, but at the same time in such a good-humoured manner as was very entertaining. On looking steadfastly at one of them, he began to chatter with great fluency, and "grinned horribly a ghastly smile." Some continued about the ship till midnight; finding, however, at length, that they were but little noticed, for the captain wanted to get rid of them, they returned on shore, where the sound of singing and beating their drums was heard all night. Mr Forster supposes there may be 50,000 inhabitants on this extensive island, which contains more than 600 square miles. "We ought (says he) to figure to ourselves this country as one extensive forest; they have only begun to clear and plant a few insulated spots, which are lost in it like small islands in the Pacific Ocean." Perhaps, if we could ever penetrate through the darkness which involves the history of this nation, we might find that they have arrived in the South-Sea much later than the natives of the Friendly and Society-Islands: so much at least is certain, that the latter appear to be a race totally distinct from the former; their form, their language, and their manners, strongly mark this difference. The natives, on some parts of New-Guinea and Papua, seem to correspond, in many particulars, with what has been observed of the Mallicollese. They differ likewise very widely from the light-coloured inhabitants of the South-Sea, by keep-

ing their bodies entirely free of punctures. Whatever these people saw, they coveted; but they never repined at a refusal. The looking-glasses which were given them were highly esteemed, and they took great pleasure in viewing themselves; so that these ugly people seemed to have more conceit than the beautiful nation at O-Taheitee and the Society Islands. Early the next morning the natives came off to the ship in their canoes, and four or five of them went on board without any arms. They soon became familiar, and, with the greatest ease, climbed up the shrouds to the mast-head; when they came down, the captain took them into his cabin, and gave them medals, ribbons, nails, and pieces of red-baize. They appeared the most intelligent of any nation that had been seen in the South-Sea: they readily understood the meaning conveyed by signs and gestures; and in a few minutes taught the gentlemen of the ship several words in their language, which appeared to be wholly distinct from that general language of which so many dialects are spoken at the Society-Islands, the Marquesas, Friendly-Isles, Easter-Island, and New-Zeeland. Their language was not difficult to pronounce, but contained more consonants than any of them. Mr Forster, and some of the gentlemen from the ship, went on shore, and conversed with the natives, who with great goodwill sat down on the stump of a tree to teach them their language. They were surprised at the readiness of their guests to remember, and seemed to spend some time in pondering how it was possible to preserve the sound by such means as pencils and paper. They were not only assiduous in teaching; but had curiosity enough to learn the language of the strangers, which they pronounced with such accuracy as led their instructors to admire their extensive faculties and quick apprehension. Observing their organs of speech to be so flexible, they tried the most difficult sounds in the European languages, and had recourse to the compound Russian *stsch*, all of which they pronounced at the first hearing, without the least difficulty. They presently learned the English numerals, which they repeated rapidly on their fingers; so that what they wanted in personal beauty was amply compensated to them in acuteness of understanding. They express their admiration by hissing like a goose.

Their music is not remarkable either for harmony or variety, but seemed to be of a more lively turn than that at the Friendly-Islands. Their behaviour to their visitors was, in general, harmless, but cautious: they gave them no invitation to stay among them; for they seemed not to relish the proximity of such powerful people, being probably accustom'd to acts of violence and outrage from their neighbours. "In some of their countenances," (says Mr Forster), we thought we could trace a mischievous, ill-natured disposition; but we might mistake jealousy for hatred."

Very few women were seen, but those few were no less ugly than the men: they were of small stature, and their heads, faces, and shoulders, were painted red. Those who were grown up, and probably married, had short pieces of a kind of cloth, or rather matting, round their waists, reaching nearly to their knees; the rest had only a string round the middle, with a wisp of straw; and the younger ones, from infancy to the age of ten years, went stark naked, like the boys

of the same age. The women were not observed to have any finery in their ears or round their necks and arms, it being fashionable in this island for the men only to adorn themselves; and wherever this custom prevails, the other sex is commonly oppressed, despised, and in a state of servility. Here the women were seen with bundles on their backs, which contained their children; the men seemed to have no kind of regard for them. None of them came off to the ship, and they generally kept at a distance when any party landed from the boat. They perforate the cartilage of the nose between the nostrils; and thrust therein a piece of white stone about an inch and a half long, which is bent like the curvature of a bow. The houses here are, like those of the other isles, rather low, and covered with a palm-thatch. Some were inclosed or walled round with boards, and the entrance to these was by a square hole at one end.

Their weapons are bows and arrows, and a club about two feet and a half in length, made of the cauarina wood, commonly knobbed at one end, and well polished. This weapon they hang on their right shoulder, from a thick rope made of a kind of grass. It appeared to be preserved for close engagements, after having emptied the quiver. On the left wrist they wear a circular wooden plate, neatly covered, and joined with straw, about five inches in diameter, upon which they break the violence of the recoiling bow-string, and preserve their arm unhurt. Their arrows are made of a sort of reed; and are sometimes armed with a long sharp point made of the red wood, and sometimes with a very hard point made of bone: and these points are all covered with a substance which was supposed to be poisoned. Indeed the people themselves confirmed these suppositions, by making signs to the gentlemen of the ship not to touch the point, and giving them to understand that if they were pricked by them they would die: they are very careful of them themselves, and keep them always wrapt up in a quiver. Some of these arrows are armed with two or three points each, with small prickles on the edge to prevent the arrow being drawn out of the wound. Repeated and effectual trials of the virulence of this poison were made upon dogs, but they gave no signs of being hurt by it.

Their food seems to be principally vegetables, since they apply themselves to husbandry. As hogs and fowls are bred here, the natives, doubtless, feast sometimes on pork and poultry; and as they have canoes, it may be supposed that they draw a part of their subsistence from the ocean. The greatest number of canoes that were seen along-side the ship at one time did not exceed 10, or, according to Mr Forster, 14, and no more than four or five people in each: they were small, not exceeding two feet in length, of indifferent workmanship, and without ornament; but provided with an outrigger.

After some slight indications of a hostile intention on the part of the natives, which they had shewn in their canoes whilst about the ship, captain Cook, with a party of marines in two boats, landed in the face of 400 or 500 Indians who were assembled on the shore. Tho' they were all armed with bows and arrows, clubs and spears, they made not the least opposition; on the contrary, seeing the captain advance alone, unarmed, with only a green branch in his hand, one of them,

who

**MALMESBURY** who seemed to be a chief, giving his bow and arrows to another, met him in the water, bearing also a green branch. When they met, the branches were exchanged; and the chief led the captain by the hand up to the crowd, to whom he immediately distributed presents: in the mean time the marines were landed, and drawn up upon the beach. The captain then made signs that he wanted wood, and they by signs gave him permission to cut down the trees. A small pig was presently brought, and presented to the captain, who in return gave the bearer a piece of cloth. It was expected, from this instance, that an exchange of provisions for various articles of merchandize would take place; but these expectations proved fallacious; no more pigs were procured, and only about half a dozen cocoa-nuts, and a small quantity of fresh water. As these islanders were possessed of hogs as well as fowls, their backwardness to part with either might be owing to the little estimation in which they held such articles as were tendered in barter; for they set no value on any nails, or any other kind of iron-tools, and held all the gew-gaws of finery equally cheap. They would now and then exchange an arrow for a piece of cloth, but very seldom would part with a bow. After sending on board what wood had been cut, the party all embarked, and the natives dispersed. When the ship was about to leave this island, captain Cook gives the following relation: "When the natives saw us under sail, they came off in canoes, making exchanges with more confidence than before, and giving such extraordinary proofs of their honesty as surprised us. As the ship at first had fresh way thro' the water, several of the canoes dropped astern after they had received goods, and before they had time to deliver theirs in return: instead of taking advantage of this, as our friends at the Society-islands would have done, they used their utmost efforts to get up with us, and deliver what they had already been paid for. One man in particular followed us a considerable time, and did not reach us till it was calm, and the thing was forgotten. As soon as he came along-side, he held up the article, which several on board were ready to buy: but he refused to part with it till he saw the person to whom he had before sold it; and to him he gave it. The person not knowing the man again, offered him something in return, which he refused; and showing him what had been given before, at length made him sensible of the nice sense of honour which had actuated this Indian."

**MALMSBURY**, a town of Wiltshire in England, pleasantly seated on a hill and on the river Avon, which almost surrounds it, and over which it has six bridges. W. Long. 2. 7. N. Lat. 51. 34.

*William of MALMSBURY.* See WILLIAM.

**MALO** (St.), a sea-port town of France, in Bretagne, with a bishop's see. It has a large well frequented harbour, but difficult of access, on account of the rocks that surround it; it is a rich, trading place, of great importance, and defended by a strong castle. It was bombarded by the English in 1693, but without success. However, in June 1758, they landed men in Cancalle Bay, who went to the harbour by land, and burnt above 100 ships, great and small; and then retired without loss. It is seated on an island united to the main land by a causeway; is chiefly inhabited by seafaring men, who in time of war fit out a great many

privateers to cruise upon the English. W. Long. 1. Malapight 57. N. Lat. 48. 39.

**MALPIGHI** (Marcellus), an eminent Italian physician and anatomist in the 17th century. He studied under Massari and Mariano. The duke of Tuscany invited him to Pisa, to be professor of physic there. In this city he contracted an intimate acquaintance with Borelli, to whom he ascribed all the discoveries he had made. He went back to Bologna, the air of Pisa not agreeing with him. Cardinal Antonio Pignatelli, who had known him while he was leuate at Bologna, being chosen pope in 1691, under the name of *Innocent XII.* immediately sent for him to Rome, and appointed him his physician. But this did not hinder him from pursuing his studies, and perfecting his works, which have immortalized his memory. He died in 1694; and his works, with his life written by himself prefixed, were first collected and printed at London in folio in 1697.

**MALPIGHIA**, **BARBADOES CHERRY**; a genus of the triandria order, belonging to the decandria class of plants. There are eight or ten species, all of them shrubby evergreens of the warm parts of America, rising with branchy stems from 8 or 10 to 15 or 20 feet high, ornamented with oval and lanceolate entire leaves, and large pentapetalous flowers, succeeded by red, cherry-shaped, eatable berries; of an acid and palatable flavour; and which, in the West Indies, where they grow naturally, are used instead of cherries. Three of the species are reared in our gardens, and make a fine variety in the stove. They retain their leaves all the year round; and begin to flower about the end of autumn, continuing in constant succession till the spring; after which they frequently produce and ripen their fruit, which commonly equals the size of a small cherry. The flowers are of a pale-red or purple colour. These plants are propagated by seed, which must be sown in spring, in pots of rich earth: then plunge them in a hot-bed; and when the plants are three or four inches high, prick them in separate small pots, give water, and plunge them in the bark-bed of the stove; where, after they have remained a year or two, they may be placed in any part of it. They may even be placed in the open air during a month or two of the hottest weather in summer; but must be carefully supplied with water during the whole year.

**MALPLAQUET**, a village of the Netherlands, in Hainault, famous for a most bloody battle fought here on the 11th of September 1709, between the French under old marshal Villars, and the allies commanded by prince Eugene and the duke of Marlborough. The French army amounted to 120,000 men; and were posted behind the woods of La Marte and Taniers, in the neighbourhood of Malplaquet. They had fortified their situation in such a manner with lines, hedges, and trees laid across, that they seemed to be quite inaccessible. In this situation they expected certain victory; and even the common soldiers were so eager to engage, that they flung away the bread which had been just given them, though they had taken no sustenance for a whole day before. The allied army began the attack early in the morning, being favoured by a thick fog. The chief fury of their impression was made upon the left of the enemy; and with such success,

Male,  
Malta.

cefs, that, notwithstanding their lines and barricadoes, the French were in lefs than an hour driven from their entrenchments. But on the enemy's right the combat was fultained with much greater oblatinity. The Dutch, who carried on the attack, drove them from their firft line; but were repulled from the fecond with great slaughter. The prince of Orange, who headed that attack, perfifted in his efforts with incredible perfeverance and intrepidity, tho' two horfes had been killed under him, and the greater part of his officers flain and difabled. At laft, however, the French were obliged to yield up the field of battle; but not till after having fold a dear-bought victory. Villars being dangerously wounded, they made an excellent retreat under the conduct of Boufflers, and took poft near Guefnoy and Valenciennes. The conquerors took poffeffion of the field of battle, on which above 20,000 of their beft troops lay dead. The lofs of the French, it is faid, did not exceed 8000; and marfhal Villars confidently afferted, that, if he had not been difabled, he would have gained an undoubted victory.

MALT. See BREWING.

MALT-Tax, is the fum of 750,000*l.* raifed every year by parliament fince 1697, by a duty of 6*d.* on the buhel of malt, and a proportionable fum on certain liquors, fuch as cyder and perry, which might otherwife prevent the confumption of malt. This is under the management of the commissioners of the excife; and is indeed itfelf no other than the annual excife. In 1760, an additional perpetual excife of 3*d.* per buhel was laid upon malt; and in 1763, a proportional excife was laid upon cyder and perry, but new-modelled in 1766. See EXCISE.

MALTA, a celebrated ifland of the Mediterranean, fituated between the 15th and 16th degrees of eaft longitude, and between the 35th and 36th degrees of north latitude. It is about 19 or 20 leagues in length, nine or ten in breadth, and 60 in circumference. Anciently it was called *Melita*; and is fuppofed by Cluverius, from its fituation, and other particulars, to be the *Hipieria* mentioned by Homer, whence the Phœacians were afterwards driven by the Phœnicians, and retired into Scheria and the ifland of Corfu; which is the more probable, as the ancient poet places the mountain *Melita* in that ifland. He hath likewife brought fome very probable arguments to prove, that *Melita* or *Malta* is the ancient *Ogygia*; in which the famed nymph *Calypfo*, daughter of the Ocean and Thetis, received the fhipwrecked Ulyffes, and detained him feven years.

The moft ancient poffeffors of Malta of whom we have any certain account, were the Carthaginians; from whom it was taken by the Romans; and yet during the whole time that it continued under the power of thefe polite nations, it was almoft entirely barren. The foil was partly fandy and partly rocky, having fcarcely any depth of earth; and withal fo ftony, that it was hardly capable of producing corn or any other grain except cummin, and fome feeds of a fimilar nature. Its chief products were figs, melons, honey, cotton, and fome few other fruits and commodities which the inhabitants exchanged for corn; and in this barren ftate it feems to have continued till it came into the poffeffion of the Maltefe knights. It laboured alfo under great fcarcity of water and fuel: upon all

which accounts it was till that time but thinly inhabited, there being only about 30 or 40 boroughs or other villages fattered about, and no city except the capital, called alfo *Malta*, and the town and fort of *St Angelo*, which defended the harbour: fo that the whole number of its inhabitants did not exceed 12,000, including women and children; the greateft part of which were very indigent.

According to an ancient tradition, Malta was firft poffeffed by an African prince named *Battus*, an enemy to queen *Dido*; from whom it was taken by the Carthaginians, as may be juftly inferred from feveral Punic infcriptions to be feen on ftone-pillars, and other monuments yet ftanding. From the Carthaginians it paffed to the Romans, who made themfelves mafters of it at the fame time that they fubdued the ifland of Sicily. Thefe were driven out by the Arabs in the year 828; who were driven out of it in their turn by Roger the Norman, earl of Sicily, who took poffeffion of it in 1190: from which time it continued under the dominion of the Sicilian princes till the time of Char. V. when it fell under his power, along with Naples and Sicily. To cover the ifland of Sicily from the Turks, Charles gave the ifland to the knights of *Rhodes*, fince that time called *knights of Malta*.

The origin and hiftory of thefe knights is given under the article *Knights of MALTA and RHODES*. Here it is fufficient to obferve, that in 1530, the knights of *Rhodes* having been expelled from that ifland by Soliman the Turkifh fultan, and deftitute of an habitation, accepted, tho' not without fome reluctance on account of its barrennefs, the offer made them by Charles V. of the ifland of Malta. The grand mafter having caufed his two large carracks, the galleys of the order, and a good number of other transport-fhips laden with great quantities of arms, ammunition, and troops, to be got ready, he and his knights embarked in the former, with all the effects, records, and treafure belonging to the order, and the reft in the latter. In their paffage they fuffered very much by a violent ftorm; in which one of their galleys fplit upon a rock, and one of the carracks was run aground by the violence of the waves, after having broke her three anchors. She ftuck fo faft, that they expected every moment to fee her fplit in pieces; when providentially a contrary wind difengaged her without damage. This event was counted as a lucky omen, and on the 26th of October that year, all the company were fafely landed.

At the firft landing of the Maltefe knights, they found themfelves obliged to lodge in a very poor town or borough at the foot of the hill on which ftands the caftle of *St Angelo*, and where their only habitations were fifhermen huts. The grand mafter, with the principal knights, took poffeffion of the caftle, where the accommodations were fomewhat better; tho' thefe too were very mean, and out of repair. Three days after, he took poffeffion of the city, which was formerly called *Malta*, but fince that time hath taken the name of the *Notable City*; and after that, of the whole ifland of Malta, and the neighbouring one of *Gofa*.

The firft care of the knights, after having fettled their authority thro' the two iflands, was to provide fome better accommodation for the prefent, and to chofe a proper place where to fix their habitation.

Malta.

But as the island had no other defence than the old castle of St Angelo, and was so much exposed on all sides, that it would have required greater sums than their exhausted treasury could spare, to put it in a proper state of defence; the grand-master was obliged to content himself with surrounding the borough abovementioned, wherein he had ordered new buildings to be reared for the present habitation of his knights, with a stout wall, to prevent its being surprised by the Turkish and Barbary corsairs. His design indeed, at this time, was not to have fixed the abode of the knights in the bare and defenceless island of Malta, but to stay in it only till he had got a sufficient force to attempt the conquest of *Modon*, a town of the Morea, and which was not only a populous and opulent place, but lay very convenient for making an attempt on the island of Rhodes, their ancient habitation, and to which they were naturally attached. This, however, did not hinder his taking all proper measures for securing Malta as well as Gosa, and laying out a proper plan for securing them from attacks, in case the design on Modon should fail.

In the mean time, as superstition was then universally prevalent, the grand-master, among other precious relics which he had brought from Rhodes, caused the arm of St Catharine to be carried in procession to the cathedral. Whilst they were on their march, one of the centinels gave them notice, that a large Turkish merchantman was wrecked on their coast. The grand-master immediately dispatched some of his knights and soldiers thither; who finding Isaac the patron of the ship, a native of Modon, and one Maurithafa Nocher, an excellent engineer, they were retained in the service of the order, and the latter was immediately employed in fortifying the island.

The knights were hardly settled in Malta, when the emperor, and other European potentates, endeavoured to engage them in a war with the inhabitants of Barbary, as the city of Tripoli, then held by Charles, was in great danger of falling into the hands of the infidels. The attempt on Modon, however, was first made; but it proved unsuccessful through the base advice of the Maltese forces: for they having been admitted into the city, during the night began to murder and plunder the inhabitants, without waiting for the arrival of the galleys which were coming to their assistance. The consequence was, that the inhabitants armed, and a desperate battle began; in which the Maltese, notwithstanding the utmost efforts, were obliged to retire, but not till they had loaded themselves with plunder; and carried away 800 women captives.

The grand-master, looking upon this disappointment as a sign that Providence had ordained Malta to be the residence of the knights, did not renew his attempts upon Modon; but, in 1532, joined with the emperor against the Turks, and sent a great number of his galleys to join the confederate fleet under the celebrated Andrew Doria. In consequence of this aid, the undertaking proved successful; and in all probability the conquest of Modon would have been accomplished, had not the soldiery, discouraged by the bad success of the last attempt, openly refused to proceed, and obliged the emperor to proceed to Coron, another town belonging to the Turks. Through the valour of the

Maltese knights, this place was soon obliged to capitulate; and in a second expedition, in 1533, the knights again distinguished themselves in a most eminent manner. They were quickly recalled, however, by the grand-master to the defence of the island, which was now threatened with an invasion by Barbarossa the celebrated Turkish corsair, who scoured those seas at the head of above fourcore galleys. This invasion, however, did not take place; and in 1534, the grand-master Villiers de L'Isle Adam died, and was succeeded by Perino de Ponte, a native of the town of Ast in Italy.

The new grand-master, who received intelligence of his election at St Euphemia in Calabria, very soon after received another express, giving an account of the wars which at that time reigned in Tunis, and the danger that Tripoli as well as Malta was in from Barbarossa, who was by this time become master both of Algiers and Tunis; upon which he made all the haste he could to his new government. His first care was to send a strong reinforcement to Italy; after which, he dispatched an embassy to the emperor, intreating him to equip a powerful fleet against Barbarossa, without which it would be impossible for Tripoli to hold out much longer.

By this embassy from De Ponte, and another to the same purpose from Muley Hassan, the deposed king of Tunis, Charles was easily prevailed on to carry his arms into Africa; in which he was assisted by a great

number of the bravest knights, together with 18 brigantines of different sizes, four of the best Maltese galleys, and their vessel called the *great carrack*, of itself almost equivalent to a Squadron. In this expedition the knights distinguished themselves in a most eminent manner. At the siege of Goletta, one of the knights,

an excellent engineer, by means of a *barcalonga*, got almost close to the great tower, which he furiously battered with large cannon, while the great carrack, which was behind all the rest of the vessels, and by reason of its height could fire over them, did prodigious execution. A breach was soon made; and hardly was it wide enough to be scaled, when the Maltese knights jumped out of the galleys into their long-boats, and thence into the sea, with their swords in their hands, and waded through the water above their girdles, it being too shallow for boats to approach the shore. The standard-bearer of the order was the first that jumped into the water, and led the rest to the attack; they claiming every where the post of honour. They marched with the greatest resolution through the most terrible firing, and showers of all kinds of missile weapons; and, having gained the shore, quickly ascended the breach, on the top of which they planted their great standard. A great number lost their lives, and scarce one came off un wounded; but the emperor did them the justice to own, that the taking the place was chiefly owing to the valour of the Maltese knights.

The city of Tunis was soon taken after the fortress of Goletta; on the surrender of which, the emperor, designing to return into Europe, took his last dinner on board the great carrack; where he was magnificently entertained, and bestowed on the surviving knights the greatest encomiums, and marks of his esteem and gratitude to the owner. These he accom-

Malta. 7. Privileges conferred upon them by the emperor. panied with considerable presents and with two new grants. By the first, they were allowed to import corn and other provisions from Sicily, without paying duty; and by the second, the emperor engaged, that none of the order should enjoy any of the estates or revenues, unless they were lawfully authorized by the grand-master and his council; or till the originals had been examined and registered by himself, or such ministers as he should appoint for that purpose. The fleet then set sail for Malta; where, on their arrival, they received the news of the grand-master's death, who was succeeded by Didier de Tolon de St Jalle, a native of Provence, and then grand prior of Tholouse, where he resided at the time of his election.

8. The Turks make an unsuccessful attempt on Tripoli. The present grand-master was a man of great conduct and bravery, which he had formerly shown at the siege of Rhodes; and the situation of affairs at this time required a person of experience. The Turkish corsairs, quite tired out with the dreadful havoc made among them by Botigella, grand prior of Pisa, who seldom quitted the sea, and never failed out without sinking some of them, or making considerable prizes, had agreed to enter into a strong confederacy, either to surprise the city of Tripoli where his retreat was, or, if that failed, to lay siege to it by sea and land; in either of which attempts, they were sure of all the assistance of Barbarossa and Hayradin, then lord of Tajoria. This last had undertaken the command and conduct of the whole enterprise; but the governor being informed of the design, prepared to give him a warm reception. Hayradin came thither with his whole force in the dead of the night, and began to scale the walls in those places where he reckoned them to be most defenceless. They no sooner appeared at the foot of them, than the garrison, which had been kept up in arms, poured down such streams of wildfire, boiling oil, melted lead, &c. and threw such volleys of stones, while the great and small guns so annoyed those that stood farthest off, that great numbers of them were destroyed. They persisted in the attack, however, with great fury and vigour, till Hayradin, who was foremost in one of the escalades, was knocked down by a musket-shot from the top of his ladder. He fell into the ditch, and was taken up almost dead; upon which his troops instantly dispersed themselves, and abandoned the enterprise. The governor of Tripoli, however, judging that this would not be the last visit of the kind which in all probability he would receive, immediately dispatched an express to Malta, with proposals for fortifying the city, and demolishing a strong tower on that coast named *Alcaid*, which was held by a Turkish corsair. His advice being approved of, the commander Botigella, now general of the galleys, was immediately dispatched with a sufficient force; who, having landed his men at Tripoli, immediately marched, with them and a body of Arab mercenaries, towards Alcaid; and without staying to open the trenches, or any other covering than his gabions, levelled his artillery against it. Hayradin being informed of this, came with his Turks to its defence; but was intercepted by a strong detachment of Maltese knights at the head of the hired Arabs, and repulsed with loss; so that all he could do was to convey about 50 or 60 Turks into the place, and to annoy the Christians with

some slight skirmishes. Botigella, perceiving that his cannon did not make such quick dispatch as he wished, sent some of his galleys; under the shelter of which he quickly sprung a mine, which brought down part of the wall, and buried most of the corsairs under it; upon which the rest, seeing the Maltese knights mount the breach sword-in-hand, immediately threw down their arms. The tower was then razed to the ground; after which Botigella marched to a town called *Adabur*, whence he drove Hayradin who had intrenched himself in it, and gave the plunder to the Arabs. In his return he attacked and took a large Turkish galley, the cargo of which was valued at 160,000 crowns, and had on board 200 persons; so that he landed in triumph, and was received with the loud acclamations of the whole order, who came to meet him on his arrival. Soon after the grand-master fell sick and died, and was succeeded by John de Homedes.

The Maltese still continued to behave with their usual valour against the Turks; but, through the negligence of Charles V. almost all the places held by the Christians on the African coast were reduced by the infidels, and the valour exerted by the Maltese served only to destroy great numbers of them. At last the emperor's affairs in Africa were totally ruined by his unsuccessful expedition against ALGIERS, an account of which was given under that article, n<sup>o</sup> 14-20. Here indeed it is thought that the emperor himself could not have escaped, had not the Maltese knights repulsed the Turks, who had attacked even the imperial quarters. They pursued them even to the gates of the city, and were in hopes of entering it with them; but the governor having caused the gates to be shut before the Turks had all got in, the knights were disappointed. When the Spanish troops reembarked, the Maltese were also of great service in repulsing the enemy; and indeed behaved on both occasions with so much valour and intrepidity, that the rest of the allies could not sufficiently admire them. The misfortune, however, was, that the loss they suffered, both of men and ships, especially by some of their best commanders, more than counterbalanced the glory they had gained. The emperor, before they parted, gave them the most ample testimony of his satisfaction and gratitude, as far as words and encomiums could go; after which, the Maltese commander set sail, with the small remains of his knights, in three shattered vessels, and arrived safely at the port of Malta about the end of November 1548.

While the Maltese were employed in this unfortunate expedition, the island was so terribly annoyed by the Turkish and other corsairs, that the port was in some measure blocked up by them; whilst the coasts, both here and of Gofa, lay exposed to frequent insults and depredations, and often to the loss of their inhabitants. This obliged the Maltese admiral Simconi to refit his galleys with all possible expedition, and again put to sea in quest of these enemies. In this enterprise he succeeded so well, that he sent home a great number of the corsair captains in chains. Being obliged to put in at the port of Tripoli, the governor informed him, that he had just received an express from the king of Tunis, acquainting him that Barbarossa was making the most pressing complaints to the Porte against the Maltese knights, whilst his lieutenant Morat Haga was making great preparations at Tachora for the

sigae

Malta.

siege of Tripoli, which he doubted not would be followed by that of Tunis; the king having become odious to the Turks and Moors, on account of his alliance with the emperor; after whose late disaster a great number of towns in that kingdom had revolted from him, and a much greater number of his subjects had put themselves under the protection of the Algerine monarch, who was expected shortly from Constantinople at the head of a powerful fleet.

On the receipt of these unwelcome news, an embassy was sent to the emperor, in order to persuade him to cause the fortifications of Tripoli be repaired; but without success. All that could be obtained was fair words and promises; the consequence of which was, that the Maltese made most violent and almost incredible exertions against their enemies, till at last Soliman resolved to expell the knights from Malta, as he had before done from Rhodes. To this he was chiefly instigated by Dragut, an old experienced corsair, who had obtained the command of his fleet after the death of Barbarossa. The siege was accordingly commenced in 1551; but, by a stratagem, the Turkish commander was induced to depart. However, he reduced the castle of Gofa and the city of Tripoli. Nothing happened of great consequence from that time till the year 1564, when fresh complaints being made to Soliman, he proposed, in a grand council, where most of his officers attended, to extirpate the knights altogether. This design was strenuously opposed by Hali, one of Dragut's most experienced captains, who offered the most solid reasons against it; but being overruled by the rest, an expedition against Malta was resolved upon. One of the sultan's first cares was to send some spies, in the disguise of fishermen, to take a full view of the island, who found means to bring him an exact plan of it, with all its fortifications, havens, strength, and the number of its inhabitants, &c. whilst he was hastening his armaments against it. By this time, as the Maltese had very little reason to doubt that the Turkish armaments were designed against their island, the viceroy of Sicily, Don Garcia, was ordered by his master to take it in his way to the castle of Goletta, in order to consult with the grand-master about the necessary means for opposing such a formidable power. The grand-master acquainted him, that, in case of an attack upon Malta, he should want both men and corn: upon which the viceroy engaged to supply him with both, on his return to Sicily; in pledge of which he left one of his sons with him, who was afterwards admitted into the order. He was no sooner departed, than the grand-master summoned all the knights of the order, dispersed through several parts of Europe, to repair to him. Those that were in Italy raised a body of 2000 foot, to which the viceroy of Sicily added two companies of Spanish forces. All the galleys of the order were employed in transporting these troops, together with all manner of provisions and ammunition, into the island; and the knights that were in it, in distributing, disciplining, and exercising their new levies, as well as the Maltese militia, against the siege. Thus the grand-master saw himself strengthened by the arrival of 600 knights, all of whom brought with them retinues of stout good servants, fit to assist in the defence of the island; whilst those, who by reason of age, sickness, or other impediments, could

not repair to him, sold their most valuable effects in order to assist him with their purses. The pope, on his part, contented himself with sending a supply of 10,000 crowns; and the king of Spain ordered his viceroy Don Garcia to raise an army of 20,000 men, to be ready to fail thither as soon as called for. The grand-master employed the remainder of his time in visiting all the forts, magazines, arsenals, &c. and assigning to each tongue their several posts, and making all necessary preparations, till the Ottoman fleet appeared in sight on the 18th of May 1565. It consisted of 159 large galleys and galleons, carrying on board 30,000 forces, janizaries and spahis, besides the slaves at the oar, accompanied by a considerable number of other vessels, laden with artillery, ammunition, and other necessaries for a siege. The whole armament was commanded by Miltapha Basha, an old experienced officer, aged about 85 years, and an old favourite and confidant of the sultan; of an haughty cruel temper, who made it a merit to violate his word, and to use all manner of violence against the Christians, especially against the Maltese. This formidable army landed at some distance from Il Borgo, and soon afterwards spread themselves over the country; setting fire to the villages, putting the peasants to the sword, and carrying off such of the cattle as, notwithstanding the orders of the grand-master, had not been secured within the forts and towns.

While the Turks were thus employed, La Valette (the grand-master) sent out De Copier, marshal of the order, with 200 horse and 600 foot, to watch their motions. De Copier, an officer of great experience, executed his commission with so much prudence and vigour, that, by falling unexpectedly on detached parties, he cut off 1500 Turks, with the loss only of 80 men.

The Turkish general held a council of war as soon as all his troops were landed, to assist him in resolving where he should begin his attack. Piali, the Turkish admiral, agreeably to what he understood to have been the sultan's instructions, was of opinion that they ought not to enter upon action till Dragut should arrive. But Miltapha having received information of the king of Spain's preparations, thought something ought to be done instantly for the safety of the fleet; which lay at present in a creek, where it was exposed to the violence of the east wind, and might be attacked with great advantage by the Spaniards. On this account he was of opinion, that they should immediately lay siege to a fort called *St Elmo*, which stood on a neck of land near Il Borgo, having the principal harbour on one side of it, and on the other another harbour large enough to contain the whole fleet in safety. This proposal was approved by a majority of the council, and Miltapha proceeded without delay to carry it into execution.

La Valette did not expect that a place which was neither strong nor large enough to admit a numerous defence of garrison, could be defended long against so great a force as was employed to reduce it; but he thought it necessary that the siege of this fort should be prolonged as much as possible, in order to give the viceroy of Sicily time to come to his relief. With this view, he resolved to throw himself into *St Elmo* with a select body of troops; and he was preparing to set out, when the whole body of knights remonstrated with

such

The Turks take Tripoli, and resolve to expell the knights from Malta.

such earnest importunity against his leaving the fort, that he at last consented to suffer the reinforcement, which he had prepared, to be conducted to the fort by a knight called *De Medran*, upon whose conduct and intrepidity he could rely with the most assured confidence.

Not long after *De Medran's* arrival in the fort, the garrison made a vigorous sally, in which they drove the enemy from their entrenchments, and put a number of them to the sword. But the rest soon recovered from their surprise; and having returned to the charge, they compelled the Christians to retire. In this encounter, the vigorous efforts of the Janisaries were favoured by the wind, which blew the smoke of the guns upon the fort, and covered the besieged with a thick cloud, through which it was impossible to discern the operations of the enemy. This incident the Turks had the presence of mind to improve to very great advantage. They seized, unperceived, upon the counterescarp; made a lodgement there with beams, woollacks, and gabions; and raised a battery upon it with incredible expedition. After the smoke was dispersed, the besieged beheld what had been done with much astonishment; and they were the more disquieted, as the fortification which the Turks had raised upon the counterescarp overtopped a ravelin which lay near it, in which the besieged could no longer appear with safety. They resolved, however, to defend this ravelin as long as possible, whatever it should cost them.

In the mean time *Dragut*, and another noted Corsair named *Uluchiali*, arrived with 20 galleys; having, besides slaves and seamen, 2500 troops on board. This reinforcement, and the presence of *Draguet*, added fresh vigour to the operations of the siege. This gallant Corsair exposed himself, on all occasions, with the utmost intrepidity; spent whole days in the trenches; and as, besides his other extraordinary talents, he was particularly skilful in the management of artillery, he caused some new batteries to be raised in more advantageous situations than had hitherto been made choice of; and kept up a continual fire both on the ravelin above-mentioned and a cavalier that covered the fort, and was one of its principal defences.

This cavalier soon became the only defence which could prevent the besiegers from coming up to the very foot of the wall. Some Turkish engineers having approached the ravelin at day-break, to observe the effects of their artillery, they perceived a gun-port so low, that one of them, when mounted on the shoulders of another, looked into it, and saw the Christian soldiers lying on the ground asleep. Of this they gave immediate information to the troops; who, advancing as quickly and silently as possible, and clapping ladders to the gun-hole, got up into the ravelin, and cut most of the Christians to pieces.

Between this ravelin and the cavalier lay the ditch, over which the besieged had thrown a temporary bridge of planks, leading up to the cavalier. The Turks, perceiving this, leaped instantly upon the bridge, and attempted to make themselves masters of the cavalier, as they already were of the ravelin. But the garrison was now alarmed; the bravest of the knights halted from different quarters to the post of danger; and, after an oblique engagement, they com-

pelled the Turks to retire into the ravelin. There, observing another way of reaching the cavalier by a path from the bottom of the ditch, they threw themselves down without dread or hesitation; and having ascended by this path to the other side, they renewed their attack with greater fury than ever. The combat lasted from sun-rise till noon, when the knights at last proved victorious. About 200 knights and 100 soldiers were killed; and near 3000 of the enemy.

As the ravelin was open on the side towards the fort, the besieged pointed some cannon against it, and made great havoc among the infidels. But *Multapha*, sensible of the value of the acquisition he had made, poured in fresh soldiers without number, and the pioneers coming forward with woollacks, planks, and gabions, put the troops at length in safety, and made a lodgement in the ravelin, of which the garrison were never afterwards able to dispossess them.

The grand-master's concern on account of this disaster was greatly augmented, by considering, that it could not have happened so soon without some negligence on the part of the garrison. He sent them, however, an immediate reinforcement; and both the siege and the defence were carried on with the same vigour as before.

But the situation of the besieged was now become much more dangerous than formerly. The Turks applied with unremitting diligence to heighten the ravelin till it overtopped the wall of the fort; and after this the garrison could no longer appear upon the parapet with safety. Many were killed by the enemy's artillery, several breaches were made in the wall, and the hearts of the bravest knights began to fail within them.

They agreed therefore, though with much reluctance, to apply to the grand master for liberty to quit the fort; and they made choice of the chevalier *de Medran* for their messenger. He represented, that the fort was in reality no longer tenible; and that, to continue in it, though only for a few days, would infallibly occasion the destruction of the garrison. <sup>13</sup> The knights desire permission to leave the fort, but continue in it, though only for a few days, would infallibly occasion the destruction of the garrison.

Most of the knights in council thought that this request of the garrison ought to be immediately granted. But *la Valette* was of a contrary opinion.— This he represented to the chevalier *de Medran*; and sent him back with instructions to remind the knights of the vows which they took, at their entrance into the order, of sacrificing their lives for its defence. He likewise bad him assure them, in his name, that he would not fail to send them such reinforcements as they should stand in need of; and was determined, as soon as it should be necessary, to come himself to their assistance, with a fixed unalterable purpose to lay down his life, sooner than deliver the fort into the hands of the infidels.

This answer had the desired effect on several of the knights, and particularly on those whose principles of honour and attachment to the order were confirmed by years. But the greater part of them were much dissatisfied. They thought the grand-master's treatment of them harsh and cruel; and wrote him a letter, subscribed by 53, in which, after repeating their former request, they informed him, that if he did not, on the next night, send boats to carry them to the town,

Malta. town, they were determined to fall out into the Turkish camp, where they might fall honourably by the sword, instead of suffering such an ignominious death as they had reason to expect if the fort was taken by storm.

To this letter la Valette replied, "That they were much mistaken if they expected to satisfy their honour by throwing away their lives; since it was no less their duty to submit to his authority, than to sacrifice their lives in defence of the order: that the preservation of the whole depended on their present obedience to his commands: that no aid was to be expected from Spain, if the fort were given up. And that if he should yield to their request, and bring them to the town, the town itself would then be immediately invested; and they, as well as the rest, soon afterwards reduced to a situation more desperate than that from which they were so solicitous to escape, by deserting an important post which they had undertaken to defend." Besides this letter, he sent three commissioners to examine the state of the fortifications; intending by this measure, either to gain time, or to prevent the garrison from sinking into despair.

These commissioners differed very widely in the accounts which they delivered at their return. Two of them thought it impossible to defend the fort much longer. But the third, named Constantine Caltriot, a Greek prince, descended from the famous Albanian hero Scanderbeg, whether from ignorance, or a consciousness of greater resources in his native courage than the other two possessed, maintained that the garrison was far from being reduced to the last extremity; and to give proof how firmly he was persuaded of the truth of what he said, he offered to enter the fort himself, and to undertake the defence of it with such troops as should be willing to accompany him.

The grand-master, strongly impressed with a sense of the necessity of protracting the siege, immediately accepted this offer, and bestowed the highest encomiums on Caltriot's zeal and resolution. Nor did Caltriot find any difficulty in persuading a sufficient number to attend him, who were no less zealous and resolute than himself. The soldiers crowded to his standard, and were emulous to have their names enrolled for that dangerous service in which he had engaged.

When la Valette saw the spirit by which these men were animated, and had no longer any doubt of being able, by their means, to prolong the siege of the fort; he sent a letter to the knights, acquainting them, that he was now willing to give them their discharge; and would immediately send another garrison, into whose hands, he desired, they should be ready to deliver up the fort, and come themselves to the town in the boats in which their successors were to be transported.

The contents and style of this letter affected the knights in the most sensible manner, and roused within them that delicate sense of honour by which the order had been so long and so eminently distinguished. — They resolved without hesitation to remain in the fort till every man should perish, rather than either deliver it to the new garrison, or abandon it to the enemy. And they went in a body to the governor, and intreated him to inform the grand-master of their

repentance, and to join with them in praying that they might be suffered to wipe out the remembrance of their fault by their future conduct.

The grand-master suffered himself at last to be overcome; and henceforth the garrison, dismissing all thoughts of their own safety, were intent on nothing but how to prolong the defence.

The grand-master sent them every night fresh troops, to supply the place of the killed and wounded; and kept them well furnished with provisions, ammunition, and fire-works. Of these last he had invented a particular kind, which consisted of hoops of wood, covered with wool, and steeped in boiling oil and other inflammable liquors, mixed with nitre and gunpowder. To these machines they set fire, and threw them flaming in the midst of the enemy when they were crowded together at an assault. It happened often, that two or three of the Turks were hooked together and scorched to death; and the utmost confusion was produced wherever they were thrown.

The besieged stood much in need of this, and every other instrument of mischief that could be devised, for their defence. In spite of the most vigorous opposition, the Turks had cast a bridge over the ditch, and begun to sap and undermine the wall. From the 17th of June to the 14th of July, not a single day passed without some encounter; and Mustapha had frequently attempted to scale the wall of the fort, but had been as often repulsed with the loss of some of the bravest of his troops.

Alarmed at having been detained so long before a place of such inconsiderable strength, he resolved to make one great decisive effort; and to bring to the assault as many of his forces as the situation of the place would permit him to employ. He had already made several breaches; but in order to secure the success of the assault which he now intended, he kept his batteries playing all the 15th without intermission, till the wall on that side where he designed his attack was almost level with the rock. On the 16th, the fleet was drawn up, before sun-rise, as near the fort as the depth of the water would allow. Four thousand musketeers and archers were stationed in the trenches; and the rest of the troops, upon a signal given, advanced to the breach. The garrison was prepared to receive them; the breach was lined with several ranks of soldiers, having the knights interpersed among them at certain distances. The Turks attempted often to break through this determined band, and to overpower them with their numbers; but their numbers served only to augment the loss which they sustained. Every shot from the fort did execution. The artillery made dreadful havoc among them; and the burning hoops were employed with astonishing success. The novelty of these machines, and the shrieks of those who were caught in them, added greatly to the terror which they inspired; and made it impossible for the Turkish officers to keep their men firm and steady in pursuing the advantages which, had they preserved their ranks, their numbers must have infallibly acquired.

At length Mustapha, after having continued the assault for more than six hours, without gaining a single inch of ground on the besieged, gave orders for sounding a retreat. In this attack the garrison lost

hoops.

about

Malta.

about 20 knights, and 300 soldiers; but this loss was immediately supplied by a reinforcement from the town: and Multapha was at last convinced, that, unless the communication between the fort and the town were cut off, it would be impossible to bring the siege of the former to a period, while any troops remained in the other parts of the island. By the advice of Dragut, he resolved to extend his trenches and batteries on the side next the town, till they should reach to that part of the sea, or great harbour, where those supplies were landed which the grand-master daily sent to the garrison. This undertaking he knew must be attended with the utmost difficulty, because all the space between his intrenchments, and the point to which it was necessary to extend them, lay exposed to the artillery both of fort St Elmo and St Angelo. In viewing the ground, a Sangiac, in whom he put confidence, was killed by his side; and, which was still a more irreparable loss, Dragut received a mortal wound, of which he died in a few days. This did not, however, discourage Multapha from pursuing his design. By employing his troops and pioneers at the work day and night, without intermission, he at length carried it into execution. Then having planted batteries along the shore, and filled his trenches with musketeers, it was impossible for any boat to pass from the town to the fort, without the most imminent danger of either being sunk or intercepted.

After this precaution, he resumed with fresh vigour his attempts to take the fort by storm. On the 21st, he made four different assaults: all of which the garrison withstood; and, in repulsing so many thousand brave and well-disciplined troops, displayed a degree of prowess and fortitude which almost exceeds belief, and is beyond the power of description. But this heroic garrison was now exceedingly reduced in number; and there was the strongest reason to apprehend, that, in one assault more, they must inevitably be overpowered, unless a reinforcement were sent them from the town. Of their desperate situation they gave intelligence to the grand-master, by one who swam across the harbour in the night. The boats were instantly filled with knights and other soldiers, who generously resolved to devote themselves to certain destruction for the general safety, and the preservation of the fort. They set off from the town with as much alacrity as if they had entertained the most sanguine hopes of victory; but they found the Turks everywhere so much upon their guard, and the lines so strongly defended, that, after several fruitless attempts to land, they were at last obliged to return, depressed with sorrow for the fate of their brave companions.

The garrison, now despairing of relief, gave themselves up for lost; but instead of either capitulating or attempting to escape, they prepared for death, and passed the night in prayer and in receiving the sacrament; after which they embraced one another tenderly, and then repaired to their respective posts; while such of the wounded as had been disabled from walking, were, at their own earnest desire, carried to the side of the breach, where they waited, without dismay, for the approach of the Turkish army.

Early in the morning of the 23d of July, the

Turks advanced to the assault with loud shouts, as to certain victory, which they believed to small a handful of men as now remained in the fort would not dare to dispute with them. In this expectation they were disappointed. The garrison being resolved on death, and despising danger, were more than men; and exerted a degree of prowess and valour that filled their enemies with amazement. The combat lasted upwards of four hours, till not only every knight, but every soldier had fallen, except two or three who saved themselves by swimming. The Turkish colours were then planted on the ramparts; and the fleet entered the harbour, which the fort commanded, in a kind of triumph. When Multapha took a view of the fort, and examined its size and fortifications, he could not refrain from saying, "What will not the father cost us, (meaning the town,) when the son, who is so small, has cost so many thousands of our bravest troops?" But this reflection, far from exciting his admiration of that heroic fortitude which he had found so difficult to overcome, served only to inspire him with a brutal fury. He ordered all such of the garrison as were found lying on the breach alive to be ripped open, and their hearts torn out: and, as an insult on the knights and their religion, he caused their dead bodies to be searched for, and large gashes to be made in them, in the form of a cross; after which he tied them on planks, and threw them into the sea, to be carried by the wind and tide to the town or fort St Angelo.

The grand-master was at first melted into tears at this shocking spectacle; but his grief was soon converted into indignation and revenge: and these passions betrayed him into an action unworthy of the exalted character which he bore. In order to teach the basia, as he pretended, to make war with less barbarity, he caused all the Turks whom he had taken prisoners to be massacred; and then putting their heads into his largest cannon, he shot them into the Turkish camp.

In the siege which has been related, the order lost about 1500 men, including 130 of the bravest knights.

Multapha vainly imagined, that, being intimidated by the fate of their companions, they would be now inclined to listen to terms of capitulation: and in this hope, he sent an officer with a white flag to one of the gates, attended by a Christian slave designed to serve for his interpreter. The Turk was not allowed to enter within the town; but the Christian was admitted, and was led through several ranks of soldiers under arms by an officer, who, after shewing him all the fortifications of the place, desired him to take particular notice of the depth and breadth of the ditch, and said to him, "See there, the only spot we can afford your general; and there we hope soon to bury him and all his Janizaries."

This insulting speech being reported by the slave, excited in the fiery mind of the basia the highest degree of wrath and indignation, and made him resolve to exert himself to the utmost in the prosecution of the siege. His troops, though greatly diminished, were still sufficient to invest at once both the town and the fort of St Michael. He kept a constant fire on both; but he intended first to apply to the reduction

tion of the latter, which he proposed to attack both by land and water, at the extremity of the peninsula on which it stands. In order to accomplish this design, it was necessary he should have some shipping introduced into the harbour for transporting his forces. But the mouth of the harbour having been rendered inaccessible by a great iron chain and the cannon of St Angelo, his design must have been relinquished, if Piali had not suggested an expedient against which the grand-master had not provided. This was, to make the Christian slaves and the crews of the ships draw a number of boats, by the strength of their arms, over the neck of land on which stood fort St Elmo. Of this proposal, which Mustapha immediately adopted, information was carried to the grand-master by a Turkish officer; who, being by birth a Greek, was touched suddenly with remorse, and deserted to the Christians. In consequence of this intelligence, La Valette set a great number of hands to work in framing a facade along that part of the promontory where the Turks intended their attack; and at another part, where the depth of the water, or the hardness of the bottom, would not admit the facade, he caused strong intrenchments to be made upon the beach. Mustapha, in the mean time, fired incessantly upon the fort, while the slaves and crews were employed in transporting the boats over land into the harbour. At length the basha, judging that the number of boats which he had transported would be sufficient, and that the breaches which his artillery had made were practicable, resolved, without further delay, to make an attack both by sea and land. He was the more confident of success, as, since the taking of St Elmo, he had received a considerable reinforcement, by the arrival of Hascem, son of Barbarossa, with 2500 select soldiers, commonly called the *Braves of Algiers*. Hascem, who possessed a considerable share of his father's fire, and was ambitious to distinguish himself in the sultan's service, begged of Mustapha to intrust him with the assault of fort St Michael; and vaunted, with his natural arrogance, that he would soon make himself master of it sword-in-hand. The basha, whether from an opinion of his valour, or an intention to make him learn at his own expence the folly of his presumption, readily complied with his request; and, having added 6000 men to his Algerines, he promised to support him with the rest of his army.

Hascem divided his forces with Candellissa, an old corsair, his lieutenant; to whom he committed the attack by sea, whilst he reserved that on the land side to himself.

Candellissa having put his troops on board the boats, set out with drums beating, and hautboys and other musical instruments playing, preceded by a boat filled with Mahometan priests, some of whom were employed in offering prayers to heaven for his success, or in singing hymns; while others had books in their hands, out of which they read imprecations against the Christians. Candellissa attempted first to break down the facade which had been formed to obstruct his landing; but finding it much stronger than he expected, and that, while he was employed in demolishing it, his troops must suffer greatly from the enemy's fire, he thought it would be easier to make a descent

on that part of the shore which the grand-master had strengthened with entrenchments. At this important post, the Christian troops were commanded by an ancient knight of the name of *Guimeran*. This experienced officer reserved his fire till the Turks had advanced within a little distance of the shore, when, by a single discharge, he killed about 400 men. This did not prevent the rest from approaching. Candellissa pushed forwards while the Christians were loading their cannon, and landed at the head of his Algerines. But Guimeran having reserved some cannon charged with grape-shot, did dreadful execution among them after they had landed, and many of them began to fly to their boats; which Candellissa observing, he commanded the boats to be put off to a little distance from the shore. His troops, perceiving then that they must either die or conquer, took courage from despair, and advanced boldly to the intrenchment, with ladders for scaling it in one hand, and their sabres in the other. The combatants on both sides displayed the most intrepid valour. Great numbers fell, and the ditch was choaked with blood, and with the bodies of the dead and wounded. The Turks at last, after an engagement of five hours, reached the top of the entrenchment, and there planted their ensigns. The knights, stung with shame on account of their retreat, returned with redoubled ardour. But they would probably have been overpowered by the superior number of the enemy, had not the grand-master sent them a seasonable reinforcement, under the admiral de Giou and the chevalier de Quincy; who fell upon the Algerines and Turks with a degree of fury that struck terror into Candellissa himself, who was noted for his intrepidity. Having ordered the boats to be brought nearer the shore, he was among the first who fled. His bravoes fought desperately for some time after he had left them; but were at length thrown down from the intrenchments, and compelled to fly to their boats with the utmost precipitation. The Christians pursued them, and the batteries continued firing on them without intermission. Many of the boats were sunk; the water was covered with dead bodies, mangled limbs, shields and helmets. Of the 4000 who had been sent on this enterprize, scarcely 500 remained, and many of these were dangerously wounded.

Hascem was not more fortunate in his assault by land, than Candellissa was by sea. After having been repulsed at one breach with great slaughter, he rallied his troops, and led them on to another, where he fought long and desperately, till, most of the bravoes having fallen by his side, he was obliged, with much reluctance and sorrow, to found a retreat.

Mustapha, not unmindful of his promise to support him, no sooner perceived him beginning to retire, than he ordered the Janisaries, whom he kept under arms, to advance. The garrison had maintained an engagement with Hascem for five hours, in the middle of the day, and in the hottest season of the year; yet, as if they had not been subject to the wants and weaknesses of humanity, they advanced beyond the breach to meet the Janisaries, and fought apparently with as much vigour and fortitude as before. By the power of superior numbers, they were compelled to fall back within the breach. But there they made the most desperate resistance; and, being reinforced by De Giou

and De Quinay, with the troops which had triumphed over Candelissa, they at last repulsed the Janisaries with dreadful slaughter; after having lost more than 40 knights, and 200 of the bravest of the common men.

Mulapha, enraged by this invincible obliquity which the Christians displayed in their defence, and dreading that the Spanish succours, which had been already delayed much longer than he expected, might soon arrive, resolved now to employ his whole force at once; and, while he himself prosecuted the siege of fort St Michael with one half of his troops, to employ the other, under Piali, against the town. More batteries were raised. The trenches were advanced still nearer than before. Bridges of sail-yards and masts were thrown over the ditches. Mines, notwithstanding the hard and rocky soil, were sprung. Assaults were repeated without number; and the two bahas, emulous of one another, and each of them agitated with continual anxiety lest victory should declare first for his competitor, exhibited the most shining proofs of personal courage, and exhausted all the art of war then known in the world. Yet, thro' the determined bravery of the knights, conducted by the grand-master with consummate prudence and indefatigable vigilance, the Turks were baffled in every attempt, and repulsed with slaughter. Mulapha flattered himself once with the most sanguine hopes of success on his part, from a machine invented by his principal engineer, in the form of a huge cask bound strongly with iron hoops, and filled with gun powder, nails, chains, bullets, and such other instruments of death. After setting fire to a train which was fastened to this machine, it was thrown, by the force of an engine, upon a ravelin that was the principal defence of the fort. But the garrison, undismayed, found means, before it caught fire, to cast it out again into the midst of the assailants. In a moment afterwards it burst with dreadful fury, and filled the Turks with consternation. The knights then sallied out upon them sword-in-hand, and, taking advantage of their confusion, killed many of them, and put the rest to flight.

Piali had, on some occasions, still more reason than Mulapha to entertain the hopes of victory, altho' the town was much stronger than the fort, and La Valette commanded there in person. By his batteries he had demolished all the out-works of the place, and had made an immense breach in the wall. While his troops were engaged in a furious assault, that engrossed the whole attention of the besieged from morning till night, he employed a great number of pioneers in raising a cavalier or platform of earth and stones, close by the breach, and so high as to overlook the parapet. Night, in the mean time, came on, and prevented him from carrying any further this great advantage; but he doubted not that next day he should be able to make himself master of the place.

As soon as he had drawn off his forces, a council of the order was convened, and most of the knights were of opinion that the town was no longer tenible; that the fortifications which still remained should be blown up; and that the garrison and inhabitants should retire into the castle of St Angelo. But the grand-master received this proposal with horror and indignation. "This would be in effect," said he, "to deliver the

whole island into the hands of the infidels. Fort St Michael, which has been so gallantly defended, and which is preserved by its communication with the town, would thus be soon reduced to the necessity of surrendering. There is no room in the castle of St Angelo for the inhabitants and troops; nor, if there were room, is there water in that fort for so great a number." It was then proposed, that at least the relics of the saints and the ornaments of the churches should be carried into the castle; and the knights earnestly intreated the grand-master to retire into it himself, assuring him that they would conduct the defence with the utmost vigour and vigilance. "No, my brethren," he replied, "what you propose as to the sacred things would serve only to intimidate the soldiers. We must conceal our apprehensions. It is here we must either die or conquer. And is it possible that I, at the age of 71, can end my life so honourably as in fighting, together with my friends and brethren, against the implacable enemies of our holy faith?" He then told them what he thought proper to be done, and proceeded instantly to put it into execution. Having called all the soldiers from fort St Angelo, except a few who were necessary for managing the artillery, he employed them and the inhabitants all night, in throwing up intrenchments within the breach; after which he sent out some of the bravest knights, with a select body of troops, to make an attempt on the cavalier. These men stole softly along the foot of the wall till they arrived at the place appointed; when they set up a loud shout, and attacked the guards whom Piali had left there with so much fury, that the Turks, believing the whole garrison had fallen upon them, abandoned their post, and fled precipitately to their camp.

The cavalier was immediately fortified, a battery of cannon planted on it, and a parapet raised on the side towards the enemy. And thus the breach was rendered impracticable; the town put in greater security than before; and a work, which had been devised for its destruction, converted into a bulwark for its defence.

The grand-master had now greater confidence than ever of being able to hold out till the Spaniards should come to his relief. In consequence of the assurances given by Philip and the Sicilian viceroy, he had, long before this time, entertained the hopes of their arrival; and had often earnestly solicited the viceroy to hasten his departure from Messina. The conduct of this nobleman was long exceedingly mysterious. The patience of the knights was worn out by his delays; and they, and many others, suspected that the real motive of his conduct was the dread of encountering with an admiral of so considerable reputation as Piali. But it afterwards appeared that the viceroy had acted agreeably to his instructions from the court of Spain. For altho' Philip was, for the reasons abovementioned, sincerely interested in the preservation of the knights, and had amused them with the most flattering promises of assistance; yet he seems from the first to have resolved not to expose himself to danger on that account, and to avoid, if possible, a general engagement.

A generous and grateful prince would have acted very differently towards an ally so deserving of his support; and if either generosity or gratitude had guided the leading principle of Philip's conduct, it is Spain pro-

Ungrateful and ungenerous conduct of Philip.

Malta. probable he would, on this occasion, have regarded the knights as his own subjects; and have thought it no less incumbent on him to exert himself in their defence, than if they had acknowledged him as their sovereign.

But Philip was affected by their danger only so far as it threatened the tranquillity of his own dominions. He had resolved to interpose in their behalf, rather than to suffer them to be overpowered; but he appears to have been very little touched with their calamities, and to have intended to leave them to themselves, as long as there was any prospect of their being able to make resistance; by doing which he considered, that he would not only preserve his own strength entire, but might afterwards engage with the Turks when they were exhausted by the operations of the siege.

Philip adhered inflexibly to this plan, notwithstanding the grand master's repeated importunities, much longer than was consistent with his own selfish views. For, without a degree of fortitude and prowess on the part of the garrison, and a degree of wisdom, vigilance, and magnanimity on that of the grand-master, infinitely higher than there could be reason to expect, it must have been impossible for such a handful of men to have withstood, for so long a time, so great a force, and such mighty efforts, as were employed to reduce them. Even the death of the grand-master alone, whose person was exposed to perpetual danger, would have proved fatal to the knights, long before Philip sent orders to his viceroy to give them any effectual support; and in this case, as his own dominions or his fleet would have been immediately attacked, he would probably have had little reason to be satisfied with the timid, ungenerous counsels which he pursued.

Whatever judgment may be formed on this head, the viceroy did not think himself at liberty to yield to the repeated applications of the grand-master, till the operations of the siege began to relax, and the Turkish forces were reduced from 45,000 to 15,000 or 16,000; of whom many were worn out with the fatigues which they had undergone, and others rendered unfit for action by a bloody flux, which for several weeks had raged amongst them.

In this situation of affairs, when it was probable that the knights would, without assistance, have compelled the Turks to raise the siege, the viceroy let the grand-master know, that he had now received such instructions from the king, as put it in his power to shew his attachment to the order: that he was not indeed permitted to attack the Turkish fleet; but that he would immediately bring him a strong body of troops, whose commanders (as he himself must return to Sicily) were to be entirely subject to the grand-master's authority till the enemy should be expelled.

The viceroy, altho' still suspected of interposing unnecessary delays, at length fulfilled his promise; and on the 7th of September landed 6000 men, under Don Alvaro de Sande and Alcanio della Corua, in that part of the island which lay at the greatest distance from the Turks; after which, he immediately carried back the fleet to Sicily.

In the mean time, intelligence being brought to Mustapha that the Spaniards were landed, and marching towards him, he was thrown into the most dreadful consternation. Sensible that his soldiers were much

dismounted by their ill success, he imagined that he was about to be attacked by a superior army, consisting of the bravest and best disciplined troops in Spain. Without waiting for information of their number, he forthwith raised the siege, drew his garrison out of St Elmo, and, leaving all his heavy cannon behind him, embarked his troops with as much precipitation as if the Spaniards with superior forces had been in sight. He had scarcely got on board when a deserter arrived from the Spanish camp, and informed him, that with 15,000 or 16,000 men, he had fled before an army that did not exceed 6000, having no general at their head, and commanded by officers who were independent of one another. The basha was overwhelmed with shame and vexation by this intelligence, and would have immediately disembarked; but this, he knew, he durst not attempt without consulting Piali, Halsem, and his other principal officers.

While he was deliberating upon it, the grand-master improved to the best advantage the leisure that was afforded him. He employed all the inhabitants, men, women, and children, as well as the soldiers, in filling up the enemy's trenches, and demolishing their works; and put a garrison without delay into fort St Elmo; in which the Turks now beheld from their ships the standard of St John erected, where that of Mahomet had lately stood.

This demonstrated to Mustapha how much new labour awaited him in case he should return to the siege; but being enraged against himself on account of the precipitancy of his retreat, and disquieted at the thoughts of the reception which he had reason to expect from Solymán, he wished to atone for his imprudence, and to wipe off the reproach in which it had involved him, by victory or death. Piali, who, from his jealousy of the basha's credit with the sultan, was not sorry for the failure of his enterprise, represented in a council of war convened on this occasion, That as the troops were much dispirited and worn out, it would be exposing them to certain destruction, either to lead them against the enemy, or to resume the operations of the siege. But a majority of the council were of a different opinion; and it was resolved to land the forces again without delay.

The Turkish soldiers complained bitterly of this unexpected resolution, and obeyed the orders to disembark with the greatest reluctance. Their officers were obliged to employ threats with some, and force with others. At length the number intended was put on shore, and Mustapha set out at their head in search of the enemy.

The grand-master had not neglected to give early notice of their march to the Spanish commanders, who had intrenched their little army on a steep hill, which the Turks would have found almost inaccessible; and it was the opinion of some of the principal officers, that they should avail themselves of the advantage of their situation, and stand on their defence. But this proposal was rejected with disdain by the bold adventurous De Sande, and the greatest part of the Spanish officers; and the troops were led out of their encampment, to meet the enemy in the open field. This conduct, more fortunate perhaps than prudent, contributed to increase the dejection of the Turkish soldiers, and to facilitate their defeat. Having been

Malta.

Malta.

dragged against their inclination to the field of battle, and being attacked by the Spaniards with great fury, both in front and flank, they scarcely fought, but, being struck with a sudden panic, fled with the utmost precipitation.

Mustapha, confounded and enraged by this pusillanimous behaviour of his troops, was hurried along by the violent tide of the fugitives. He fell twice from his horse, and would have been taken prisoner if his officers had not rescued him. The Spaniards pursued briskly till they came to the sea shore. There Piali had his boats ready to receive the Turks, and a number of shallops filled with musketeers drawn up to favour their escape. Without this precaution, they must all have perished; and, even notwithstanding the protection which it afforded them, the number of their killed amounted to 2000 men, while the victors lost only 13 or 14 at most.

Such, after four months continuance, was the conclusion of the siege of Malta, which will be for ever memorable on account of that extraordinary display of the most generous and heroic valour by which the knights, so few in number, were enabled to baffle the most vigorous efforts which could be made to subdue them by the most powerful monarch in the world. The news of their deliverance gave universal joy to the Christian powers; and the name of the grand-master excited every where the highest admiration and applause. Congratulations were sent him from every quarter; and in many states public rejoicings were celebrated on account of his success.

With this siege is concluded every thing of importance in the history of Malta. The power of the Turks began about this time to be so much circumscribed, that they ceased to be formidable to the Christian nations, and the knights of Malta had no longer an opportunity of exerting their valour as formerly. They have remained ever since in quiet possession of their island, of which we have the latest description from Mr Brydone.

26  
Description  
of the  
island, &c.

"The approach of the island (says he) is very fine, although the shore is rather low and rocky. It is everywhere made inaccessible to an enemy, by an infinite number of fortifications. The rock, in many places, has been sloped into the form of a glacis, with strong parapets and intrenchments running behind it.—On getting ashore we found ourselves in a new world indeed.—The streets (of Valetta) crowded with well-dressed people, who have all the appearance of health and affluence; and we were conducted by the English consul to an inn, which had more the appearance of a palace.

"After dinner we went to visit the principal villas of the island; particularly those of the grand-master and the general of the galleys, which lie contiguous to one another. These are nothing great or magnificent; but they are admirably contrived for a hot climate, where, of all things, shade is the most desirable. The orange-groves are indeed very fine, and the fruit they bear superior to any thing of the kind in Spain or Portugal.

"The aspect of the country is far from being pleasing: the whole island is a great rock of very white free-stone; and the soil that covers this rock, is, in most places, not more than five or six inches deep; yet,

what is singular, we found their crop in general was exceedingly abundant. They account for it from the copious dews that fall during the spring and summer months; and pretend likewise that there is a moisture in the rock below the soil, that is of great advantage to the corn and cotton, keeping its roots perpetually moist and cool: without which singular quality, they say, they could have no crop at all; the heat of the sun being so exceedingly violent.—The whole island produces corn only sufficient to supply its inhabitants for five months or little more; but the crop they most depend upon is the cotton. They begin to sow it about the middle of May, and continue till the middle of June; and the time of reaping is in the month of October and beginning of November.

"They pretend that the cotton produced from this plant, which is sown and reaped in four months, is of a much superior quality to that of the cotton-tree. I compared them; but I cannot say I found it so: this is indeed the finest; but that of the cotton-tree is by much the strongest texture. The plant rises to the height of a foot and an half; and is covered with a number of nuts or pods full of cotton: These, when ripe, they are at great pains to cut off every morning before sun-rise; for the heat of the sun immediately turns the cotton yellow; which indeed we saw from those pods they save for seed.

"They manufacture their cotton into a great variety of stuffs. Their stockings are exceedingly fine. Some of them, they assured us, had been sold for ten sequins a pair. Their coverlets and blankets are esteemed all over Europe. Of these the principal manufactures are established in the little island of Gozso, where the people are said to be more industrious than those of Malta, as they are more excluded from the world, and have fewer inducements to idleness. Here the sugar-cane is still cultivated with success, though not in any considerable quantity.

"The Maltese oranges certainly deserve the character they have of being the finest in the world. The season continues for upwards of seven months, from November till the middle of June; during which time those beautiful trees are always covered with abundance of delicious fruit. Many of them are of the red kind, much superior, in my opinion, to the others, which are rather too luscious. They are produced, I am told, from the common orange-bud, ingrafted on the pomegranate stock. The juice of this fruit is as red as blood, and of a fine flavour. The greatest part of their crop is sent in preserves to the different courts of Europe, and to the relations of the chevaliers.

"The industry of the Maltese in cultivating their little island is inconceivable. There is not an inch of ground lost in any part of it; and where there was not soil enough, they have brought over ships and boats loaded with it from Sicily, where there is plenty, and to spare. The whole island is full of inclosures of free-stone, which give the country a very uncouth and barren aspect; and in summer reflects such a light and heat, that it is exceedingly disagreeable and offensive to the eyes. The inclosures are very small and irregular, according to the inclination of the ground. This, they say, they are obliged to observe, notwithstanding the deformity it occasions; otherwise this

floods,

floods, to which they are subject, would soon carry off their soil.

"The island is covered over with country-houses and villages, besides seven cities, for so they term them; but there are only two, the Valetta, and Citta Vecchia, that by any means deserve that appellation. Every little village has a noble church, elegantly finished, and adorned with statues of marble, rich tapestry, and a large quantity of silver plate.

"The city of Valetta has certainly the happiest situation that can be imagined. It stands upon a peninsula between two of the finest ports in the world, which are defended by almost impregnable fortifications. That on the south side of the city is the largest. It runs about two miles into the heart of the island; and is so very deep, and surrounded by such high grounds and fortifications, that they assured us the largest ships of war might ride here in the most stormy weather, almost without a cable.

"This beautiful basin is divided into five distinct harbours, all equally safe, and each capable of containing an immense number of shipping. The mouth of the harbour is scarcely a quarter of a mile broad, and is commanded on each side by batteries that would tear the strongest ship to pieces before she could enter. Besides this, it is fronted by a quadruple battery, one above the other, the largest of which is a *secur d'eau*, or on a level with the water. These are mounted with about 80 of their heaviest artillery: so that this harbour, I think, may really be considered as impregnable; and indeed the Turks have ever found it so, and I believe ever will.

"The harbour on the north side of the city, although they only use it for fishing, and as a place of quarantine, would, in any other part of the world, be considered as inestimable. It is likewise defended by very strong works; and in the centre of the basin is an island on which they have built a castle and a lazaret.

"The fortifications of Malta are indeed a most stupendous work. All the boasted catacombs of Rome and Naples are a trifle to the immense excavations that have been made in this little island. The ditches, of a vast size, are all cut out of the solid rock. These extend for a great many miles, and raise our astonishment to think that so small a state has ever been able to make them.

"One side of the island is so completely fortified by nature, that there was nothing left for art. The rock is of a great height, and absolutely perpendicular from the sea for several miles. It is very singular, that on this side there are still the vestiges of several ancient roads, with the tracks of carriages worn deep in the rocks. These roads are now terminated, by the precipice, with the seas beneath; and shew, to a demonstration, that this island has formerly been of a much larger size than it is at present; but the convulsion that occasioned its diminution is probably much beyond the reach of any history or tradition. It has been often observed, notwithstanding the very great distance of mount *Ætna*, that this island has generally been more or less affected by its eruptions; and they think it probable, that on some of these occasions a great part of it may have been shaken into the sea.

"One half of mount *Ætna* is clearly discovered

from Malta. They reckon the distance near 200 Italian miles. And the people of Malta affirm, that in great eruptions of the mountain, their whole island is illuminated, and from the reflection in the water there appears a great track of fire all the way from Malta to Sicily. The thundering of the mountain is likewise distinctly heard.

"We made an expedition through the island in coaches drawn by one mule each; the only kind of vehicle the island affords. The catacombs, not far from the ancient city of Melita, are a great work: they are said to extend for 15 miles under-ground. Many people, they assure us, have been lost in them by advancing too far; the prodigious number of branches making it next to impossible to find the way out again. The great source of water that supplies the city of Valetta takes its rise near to this place; and there is an aqueduct, composed of some thousand arches, that conveys it from thence to the city. The whole of this immense work was finished at the private expence of one of the grand-masters.

"Not far from the old city, there is a small church dedicated to St Paul; and, just by the church, a miraculous statue of the saint, with a viper on his hand; supposed to be placed on the very spot where the house stood in which he was received after his shipwreck on the island, and where he shook the viper off his hand into the fire without being hurt by it: at which time the Maltese assure us, the saint cursed all the venomous animals of the island, and banished them for ever. Whether this be the cause of it or not, the fact is certain, that there are no venomous animals in Malta. They assured us, that vipers had been brought from Sicily, and died almost immediately on their arrival.

"Adjoining to the church, is the celebrated grotto in which the saint was imprisoned. It is looked upon with the utmost reverence and veneration; and if the stories they tell of it be true, it is well entitled to it. It is exceedingly damp, and produces (I believe by a kind of petrification from the water) a whitish kind of stone, which, they assure us, when reduced to powder, is a sovereign remedy in many diseases, and saves the lives of thousands every year. There is not a house in the island that is not provided with it: and they tell us there are many boxes of it sent annually, not only to Sicily and Italy, but likewise to the Levant, and to the East Indies, and (what is considered as a daily standing miracle) notwithstanding this perpetual consumption, it has never been exhausted, nor even sensibly diminished; the saint always taking care to supply them with a fresh quantity the day following. I tasted some of it, and believe it is a very harmless thing. It tastes like exceeding bad magnesia, and, I believe, has pretty much the same effects. They give about a teaspoonful of it to children in the small-pox and in fevers. It produces a copious sweat about an hour after, and, they say, never fails to be of service. It is likewise esteemed a certain remedy against the bite of all venomous animals. There is a very fine statue of St Paul, in the middle of this grotto, to which they ascribe great powers.

"The grand-master of the knights of Malta is more absolute, and possesses more power, than most sovereign princes. His titles are, *serene highness* and *eminence*; and his household-attendance and court are all very princely.

principely. As he has the disposal of all lucrative offices, he makes of his councils what he pleases; besides, in all the councils that compose the jurisdiction of this little nation, he himself presides, and has two votes. He has the disposal of 21 commanderies, and one priory, every five years; and as there is always a number of expectants, he is very much courted. He is chosen by a committee of 21; which committee is nominated by the seven nations, three out of each nation. The election must be over within three days of the death of the former grand-master; and, during these three days, there is scarce a soul that sleeps at Malta: all is cabal and intrigue; and most of the knights are masked, to prevent their particular attachments and connections from being known: the moment the election is over, every thing returns to its former channel.

"The land-force of Malta is equal to the number of men in the island fit to bear arms. They have about 500 regulars belonging to the ships of war; and 150 compose the guard of the prince. The two islands of Malta and Gozzo contain about 150,000 inhabitants. The men are exceeding robust and hardy. I have seen them row for 10 or 12 hours without intermission, and without even appearing to be fatigued. Their sea-force consists of 4 galleys, 3 galliots, 4 ships of 60 guns, and a frigate of 36, besides a number of the quick-failing little vessels called *scampavias*, (literally *runaways*.) Their ships, galleys, and fortifications, are not only well supplied with excellent artillery, but they have likewise invented a kind of ordnance of their own, unknown to all the world besides. For we found, to our no small amazement, that the rocks were not only cut into fortifications, but likewise into artillery, to defend these fortifications, being hollowed out, in many places, into the form of immense mortars. The charge is said to be about a barrel of gunpowder, over which they place a large piece of wood, made exactly to fit the mouth of the chamber. On this they heap a great quantity of cannon-balls, shells, or other deadly materials; and when an enemy's ship approaches the harbour, they fire the whole into the air: and they pretend it produces a very great effect; making a shower for 200 or 300 yards round, that would sink any vessel.

"Notwithstanding the supposed bigotry of the Maltese, the spirit of toleration is so strong, that a mosque has been lately built for their sworn enemies the Turks. Here the poor slaves are allowed to enjoy their religion in peace. It happened lately that some idle boys disturbed them during their service; they were immediately sent to prison, and severely punished. The police indeed is much better regulated than in the neighbouring countries, and assassinations and robberies are very uncommon; the lack of which crimes the grand-master punishes with the utmost severity. He is said to be much more relaxed with regard to the first.

"Perhaps Malta is the only country in the world where duelling is permitted by law. As their whole establishment is originally founded on the wild and romantic principles of chivalry, they have ever found it too inconsistent with those principles to abolish duelling; but they have laid it under such restrictions as greatly to lessen its danger. There is curious enough. The duellists are obliged to decide their quarrel in one

particular street of the city; and if they presume to fight any where else, they are liable to the rigour of the law. But, what is not less singular, but much more in their favour, they are obliged, under the most severe penalties, to put up their swords when ordered to do so by a *woman*, a *priest*, or a *knight*. Under these limitations, in the midst of a great city, one would imagine it almost impossible that a duel could ever end in blood; however, this is not the case: a cross is always painted opposite to the spot where a knight has been killed, in commemoration of his fall. We counted about 20 of these crosses.

"About three months ago, (Mr Drydone's letter is dated June 7. 1770), two knights had a dispute at a billiard-table. One of them, after giving a great deal of abusive language, added a blow; but, to the astonishment of all Malta, (in whose annals there is not a similar instance), after to great a provocation, he absolutely refused to fight his antagonist. The challenge was repeated, and he had time to reflect on the consequences; but still he refused to enter the lists. He was condemned to make the *amende honorable* in the great church of St John for 45 days successively; then to be confined in a dungeon, without light, for five years; after which, he is to remain a prisoner in the castle for life. The unfortunate young man who received this blow is likewise in disgrace, as he has not had an opportunity of wiping it out in the blood of his adversary.

"The horse-races of Malta are of a very uncommon kind. They are performed without either saddle, bridle, whip, or spur; and yet the horses are said to run full speed, and to afford a great deal of diversion. They are accustomed to the ground for some weeks before; and although it is entirely over rock and pavement, there are very seldom any accidents. They have races of asses and mules performed in the same manner four times every year. The rider is only furnished with a machine like a shoemaker's awl, to prick on his courser if he is lazy.

"As Malta is an epitome of all Europe, and an assemblage of the younger brothers, who are commonly the best, of its first families, it is probably one of the best academies for politeness in this part of the globe; besides, where every one is entitled by law as well as custom, to demand satisfaction for the least breach of it, people are under a necessity of being very exact and circumspect, both with regard to their words and actions."

*Knights of MALTA*, otherwise called *Hospitalers of St John of Jerusalem*. A religious-military order, whose residence is in the island of Malta, situated in the Mediterranean Sea, upon the coast of Africa. The Knights of Malta, so famous for defending Christendom, had their rise as follows.

Some time before the journey of Godfrey of Bouillon into the Holy Land, some Neapolitan merchants, who traded in the Levant, obtained leave of the caliph of Egypt to build an house for those of their nation who came thither in pilgrimage, upon paying an annual tribute. Afterwards they built two churches, and received the pilgrims with great zeal and charity. This example being followed by others, they founded a church in honour of St John, and an hospital for the sick; whence they took the name of *Hospitalers*. A little

little after Godfrey de Bouillon had taken Jerusalem, in 1099, they began to be distinguished by black habits and a cross with eight points; and, besides the ordinary vows, they made another, which was to defend the pilgrims against the insults of the infidels. This foundation was completed in 1104, in the reign of Baldwin; and so their order became military, into which many persons of quality entered, and changed the name of *hospitalers* into that of *knights*.

When Jerusalem was taken, and the Christians lost their power in the East, the knights retired to Acce or Ptolemais, which they defended valiantly in 1290. Then they followed the king of Cyprus, who gave them Limassol in his dominions, where they staid till 1310. That same year they took Rhodes, under the grand-master Foulques de Villaret, a Frenchman; and next year defended it against an army of Saracens: since which the grand-masters have used these four letters, F. E. R. T. i. e. *Fortitudo ejus Rhodum tenuit*; and the order was from thence called *knights of Rhodes*.

In 1522, Soliman having taken Rhodes, the knights retired into Candia, and thence into Sicily. In 1530, Charles V. gave them the island of Malta, to cover his kingdom of Sicily from the Turks. In 1566, Soliman besieged Malta; but it was gallantly defended by the grand-master John de Valette Parifot, and the Turks obliged to quit the island with great loss.

The knights consisted of eight different languages or nations, of which the English were formerly the sixth; but at present they are but seven, the English having withdrawn themselves. The first is that of Provence, whose chief is grand commander of religion; the second, of Auvergne; whose chief is marshal of the order; the third, of France, whose chief is grand-hospitaler; the fourth, of Italy; and their chief, admiral; the fifth, of Arragon; and their chief, grand-conservator; the sixth, of Germany; and their chief, grand-bailiff of the order; the seventh, of Castile; and their chief, grand-chancellor. The chief of the English is grand-commander of the cavalry.

None are admitted into this order but such as are of noble birth both by father and mother's side for four generations, excepting the natural sons of kings and princes. The knights are of two sorts; those who have a right to be candidates for the dignity of grand-master, called *grand-crosses*; and those who are only *knights assistants*, who are taken from good families. They never marry; yet have continued from 1090 to the present time.

The order consists of three estates; the knights, chaplains, and servants at arms. There are also priests who officiate in the churches; friar-servants, who assist at the offices; and *donner*, or *semi-crosses*; but these are not reckoned as constituent parts of the body. This division was made in 1130, by the grand-master Raimond du Puy.

The government of the order is mixed, being partly monarchical, and partly aristocratical. The grand-master is sovereign, coins money, pardons criminals, and gives the places of grand-priors, bailiffs, knights, &c. The ordinary council is composed of the grand-master, and the grand-crosses. Every language has several grand priories, and every priory a certain number of commanderies.

The knights are received into this order, either by

undergoing the trials prescribed by the statutes, or by dispensation. The dispensations are obtained either by the pope's brief, or by a general chapter of the order, and are granted in case of some defect as to the nobility of their pedigree, especially on the mother's side. The knights are received, either as of age, under minority, or pages to the grand-master. They must be 16 years old complete before they are received: they enter into the noviciate at 17, and are professed at 18. They sometimes admit infants of one year old; but the expence is about 4000 livres. The grand-master has 16 pages who serve him, from 12 to 16 years of age. The knights wear on the left-side of their cloak or waistcoat a cross of white waxed cloth, with eight points, which is their true badge; that of gold being only for ornament. When they go to war against the Turks they wear a red cassock, with a great white cross before and behind, without points, which are the arms of the religion. The ordinary habit of the grand-master is a sort of cassock of tabby-cloth, tied about with a girdle, at which hangs a great purse, to denote the charitable institution of the order. Over this he wears a velvet gown; and on the left side a white cross with eight points. His yearly revenue is 10,000 ducats. He acknowledges the kings of Spain, and both the Sicilies, as his protectors; and is obliged, by his agreement with the emperor Charles V. to suppress pirates.

MALTON, a town of the north-riding of Yorkshire in England, seated on the river Derwent, over which there is a good stone-bridge. It is composed of two towns, the New and the Old; and is well inhabited, accommodated with good inns, and sends two members to parliament. W. Long. o. 30. N. Lat. 54. 8.

MALVA, the MALLOW; a genus of the polyandria order, belonging to the monadelphia class of plants. There are 24 species; consisting of herbaceous perennials, biennials, and annuals, for medical and ornamental uses; rising with erect stalks from about half a yard to 10 or 12 feet high, garnished with large, roundish, lobated leaves, and quinquepetalous flowers. They are all easily and plentifully raised from seed. The leaves of the common mallow are reckoned the first of the four emollient herbs; they were formerly in some esteem, as food, for loosening the belly; at present, decoctions of them are sometimes employed in dysenteries, heat, and sharpness of urine; and, in general, for obtunding acrimonious humours: their principal use is in emollient glysters, cataplasms, and fomentations. The leaves enter the official decoction for glysters, and a conserve is prepared from the flowers.

MALVEZZI (Virgilio marquis de), an Italian gentleman, born at Bologna, acquired great reputation by his learning and writings. He was well versed in polite literature, music, law, physic, and the mathematics. He served also in a distinguished post in the army of Philip IV. king of Spain, and was employed by him in some important negotiations. He died at Bologna, in the year 1654, leaving several works in Spanish and Italian. Among the latter, are his Discourses on the First Book of Tacitus: this work has been translated into English.

MALUS, in botany. See PYRUS.

MAMALUKES, the name of a dynasty that reigned in Egypt. See that article, n° 98.

MAM-

Mamertum  
||  
Man.

**MAMBRUN** (Peter), an ingenious and learned French Jesuit, born in the diocese of Clermont, in the year 1581. He was one of the most perfect imitators of Virgil in Latin poetry, and his poems are of the same species: Thus he wrote *Eclogues*; *Georgics*, or four books on the culture of the soul and the understanding; together with a heroic poem intitled *Constantine, or Idolatry overthrown*. He shewed also great critical abilities in a Latin *Peripatetical dissertation on epic poetry*. He died in 1661.

**MAMERTUM**, or **MAMERTIUM**, (anc. geog.), an inland town of the Brutti. *Mamertini*, the people; said to have been expelled their country, and to have been hospitably received by the people of Messina in Sicily; and thus the Messanenese were called *Mamertini*. *Mamertinum Fretum*, the strait between Italy and Sicily.

**MAMMÆ**, in anatomy. See there, n° 376.

**MAMMON**, the god of riches, according to some authors; tho' others deny that the word stands for such a deity, and understand by it only *riches* themselves. Our Saviour says, *We cannot serve God and mammon*; that is, be religious and worldly-minded at the same time. Our poet Milton makes Mammon to be one of the fallen angels, and gives us his character in the following lines.

Mammon, the least erected spirit that fell  
From heav'n: for ev'n in heav'n his looks and thoughts  
Were always downward bent; admiring more  
The riches of heav'n's pavement, trodden gold,  
Than ought divine, or holy elfe enjoy'd,  
In beatific vision: by him first  
Man alse, and by his suggestion taught,  
Ranck'd the centre, and with impious hands  
Rifled the bowels of their mother earth,  
For treasures better hid. Soon had his crew  
Open'd into the hill a spacious wound,  
And digg'd our ribs of gold. Let none admire,  
That riches grow in hell; that soil may best  
Deserve the precious bane.

**MAMMÆA**, **MAMMÆE-Tree**; a genus of the monogynia order, belonging to the polyandria class of plants. There are two species; both of them large ever-green trees of the hot parts of America and Asia, and retained here in hot-houses for variety; both of them adorned with large, oval, oblong, stiff leaves, and large quadripetalous flowers, succeeded by large round eatable fruit of a most exquisitely rich flavour. They are propagated by seed, which is to be sowed in small pots of light earth, and plunged in the bark-bed, where they will soon come up; give gentle waterings, and about August transplant them into separate pots a size larger, plunging them into the bark-bed, and giving shade and water till fresh-rooted. In this country they must never be taken out of the stove.

**MAN**, **HOMO**, in zoology, is justly reckoned as the head of the animal-part of the creation; making a distinct genus of that order of quadrupeds which Linnæus calls *anthropomorpha*, from their resemblance to the human form.

The same author distinguishes the race of mankind, according to their different colours, into the Europeans, or white men; the Americans, or ruddy-coloured men; the Asiatics, or tawney-coloured men; and those of Africa, or blacks.

*Noſce teipſum*, "Know thyself," is a precept worthy of the lawgiver of Athens, the ancient seat of polite

literature; an important branch of knowledge, which may be reduced to the following heads. 1. In a religious view, *theologicæ*, that you was created with an immortal soul, after the image of God. 2. In a moral sense, *moraliter*, that you alone was blessed with a rational soul, to be employed to the praise of the Creator. 3. With respect to the other works of the creation, *naturaliter*, that you are constituted their lord, for whose use they were made. 4. In a physiological sense, *physiologicæ*, the most perfect and amazing fabric of your body. 5. With regard to diet, *diæticæ*, what things are useful, and what hurtful, in this respect. 6. In a pathological sense, *pathologicæ*, how frail you are, and how subject to a thousand calamities.

These are the heads which, according to Linnæus, comprehend the knowledge of man, considered as an individual; a branch of knowledge so essential to the human race, that, without it, he seems to doubt whether any other characters be sufficient to entitle one to be ranked among mankind: for he adds, *Hæc si noveris, HOMO es, et à reliquis animalibus distinctissimum genus*.

The whole of this work may, in some respect, be accounted an analysis of **MAN**; as comprehending his knowledge of God, of himself, and of natural and artificial objects.

**Island of MAN**, an island in the Irish sea, lying about seven leagues north from Anglesey, about the same distance west from Lancashire, nearly the like distance south-east from Galloway, and nine leagues east from Ireland. Its form is long and narrow, stretching from the north-east point of Ayr to the Calf of Man, which lies south-west, at least 30 English miles. Its breadth in some places is more than nine miles, in most places eight, and in some not above five, and contains about 160 square miles.

The first author who mentions this island is Cæsar; for there can be as little doubt, that, by the *Mona*, of which he speaks in his Commentaries, placing it in the midst between Britain and Ireland, we are to understand Man; as that the *Mona* of Tacitus, which he acquaints us had a fordable freight between it and the continent, can be applied only to Anglesey. Pliny has set down both islands; *Mona*, by which he intends Anglesey, and *Monabia*, which is Man. In Ptolemy we find *Monaæda*, or *Monaidia*, that is, the farther or more remote Môn. Orosius styles it *Mænavia*; tells us, that it was not extremely fertile; and that this, as well as Ireland, was then possessed by the Scots. Bede, who distinguishes clearly two Menavian islands, names this the *northern Menavia*, bestowing the epithet of *southern* upon Anglesey. In some copies of Nennius, this isle is denominated *Eubonia*; in others, *Mænavia*; but both are explained to mean *Man*. Alfred of Beverley also speaks of it as one of the Menavian islands. The Britons, in their own language, called it *Manaw*, more properly *Main au*, i. e. "a little island," which seems to be Latinized in the word *Mænavia*. All which clearly proves, that this small isle was as early inhabited, and as well known to the rest of the world, as either Britain or Ireland.

In the close of the first century, the Druids, who were the priests, prophets, and philosophers of the old

Man.

old Britons, were finally expelled by Julius Agricola from the southern Mona; and we are told, that they then took shelter in the northern. This island they found well planted with firs; so that they had, in some measure, what they delighted in most, the shelter of trees; but, however, not the shelter of those trees in which they most delighted, viz. the oaks: and therefore these they introduced. No history tells us this; but we learn it from more certain authority, great woods of fir having been discovered interred in the bowels of the earth, and here and there small groves of oaks: but as these trees are never met with intermixed, so it is plain they never grew together; and as the former are by far the most numerous, we may presume them the natural produce of the country, and that the latter were planted and preserved by the Druids. They gave the people, with whom they lived, and over whom they ruled, a gentle government, wise laws, but withal a very superstitious religion. It is also very likely that they hindered them, as much as they could, from having any correspondence with their neighbours; which is the reason that, though the island is mentioned by so many writers, not one of them, before Orosius, says a word about the inhabitants. A little before his time, that is, in the beginning of the fifth century, the Scots had transported themselves thither, it is said, from Ireland. The tradition of the natives of Man (for they have a traditionary history,) begins at this period. They style this first discoverer *Mannan Mac Lear*; and they say that he was a magician, who kept this country covered with mists, so that the inhabitants of other places could never find it. But the ancient chronicles of Ireland inform us, that the true name of this adventurer was *Orfenius*, the son of Alladius, a prince in their island; and that he was surnamed *Mannanan*, from his having first entered the island of Man, and *Mac Lir*, i. e. "the offspring of the sea," from his great skill in navigation. He promoted commerce; and is said to have given a good reception to St Patrick, by whom the natives were converted to Christianity.

The princes who ruled after him seem to have been of the same line with the kings of Scotland, with which country they had a great intercourse, assisting its monarchs in their wars, and having the education of their princes confided to them in time of peace.

In the beginning of the seventh century, Edwin, king of Northumberland invaded the Menavian islands, ravaged Man, and kept it for some time, when, Beda assures us, there were in it about 300 families; which was less than a third part of the people in Anglesey, though Man wants but a third of the size of that island.

The second line of their princes they derive from Orri, who, they say, was the son of the king of Norway; and that there were 12 princes of this house who governed Man. The old constitution, settled by the Druids, while they swayed the sceptre, was perfectly restored; the country was well cultivated, and well peopled; their subjects were equally versed in the exercise of arms, and in the knowledge of the arts of peace: in a word, they had a considerable naval force, an extensive commerce, and were a great nation, tho'

inhabiting only a little isle. Guttered the son of Orri built the castle of Ruffyn, A. D. 960, which is a strong place, a large palace, and has subsisted now above 800 years. Macao was the ninth of these kings, and maintained an unsuccessful struggle against Edgar, who reduced all the little sovereigns of the different parts of Britain to own him for their lord; and who, upon the submission of Macao, made him his high-admiral, by which title (*archipirota*, in the Latin of those times,) he subscribes that monarch's charter to the abbey of Glastonbury.

After the death of Edward the Confessor, when Harold, who possessed the crown of England, had defeated the Norwegians at the battle of Stamford, there was amongst the fugitives one Goddard Crownan, the son of Harold the Black, of Iceland, who took shelter in the isle of Man. This isle was then governed by another Goddard, who was a descendant from Macao, and he gave him a very kind and friendly reception. Goddard Crownan, during the short stay he made in the island, perceived that his name-sake was universally hated by his subjects; which inspired him with hopes that he might expel the king, and become master of the island. This he at last accomplished, after having defeated and killed Fingal the son of Goddard, who had succeeded his father. Upon this he assigned the north part of the island to the natives, and gave the south to his own people; becoming, in virtue of his conquest, the founder of their third race of princes. However he might acquire his kingdom, he governed it with spirit and prudence; made war with success in Ireland; gained several victories over the Scots in the Isles; and, making a tour through his new-obtained dominions, deceased in the island of Islay. He left behind him three sons. A civil war breaking out between the two eldest, and both of them deceasing in a few years, Magnus king of Norway coming with a powerful fleet, possessed himself of Man and the Isles, and held them as long as he lived; but, being slain in Ireland, the people invited home Olave, the youngest son of Goddard Crownan, who had fled to the court of England, and been very honourably treated by Henry the Second. There were in the whole nine princes of this race, who were all of them feudatories to the kings of England; and often referred to their court, were very kindly received, and had pensions bestowed upon them. Henry III. in particular, charged Olave, king of Man, with the defence of the coasts of England and Ireland; and granted him annually for that service 40 marks, 100 measures of wheat, and five pieces of wine. Upon the demise of Magnus, the last king of this isle, without heirs-male, Alexander III. king of Scots, who had conquered the other isles, seized likewise upon this; which, as parcel of that kingdom, came into the hands of Edward I. who directed William Huntercumbe, guardian or warden of that isle for him, to restore it to John Baliol, who had done homage to him for the kingdom of Scotland.

But it seems there was still remaining a lady named *Austica*, who claimed this sovereignty, as cousin and nearest of kin to the deceased Magnus. This claimant being able to obtain nothing from John Baliol, applied herself next to king Edward, as the superior

**Man.** lord. He, upon this application, by his writ, which is yet extant, commanded both parties, in order to determine their right, to appear in the king's-bench. The progress of this suit does not appear; but we know farther, that this lady, by a deed of gift, conveyed her claim to Sir Simon de Montacute; and, after many disputes, invasions by the Scots, and other accidents, the title was examined in parliament, in the seventh of Edward III. and solemnly adjudged to William de Montacute; to whom, by letters-patent, dated the same year, that monarch released all claim whatsoever.

In the succeeding reign, William Montacute, earl of Salisbury, sold it to Sir William Scroop, afterwards earl of Wiltshire; and upon his losing his head, it was granted by Henry IV. to Henry Percy, earl of Northumberland; who, being attainted, had, by the grace of that king, all his lands restored, except the isle of Man, which the same monarch granted to Sir John Stanley, to be held by him of the kings his heirs and successors, by homage, and a cast of falcons to be presented at every coronation. Thus it was possessed by this noble family, who were created earls of Derby, till the reign of queen Elizabeth; when, upon the demise of earl Ferdinand, who left three daughters, it was, as lord Coke tells us, adjudged to those ladies, and from them purchased by William earl of Derby, the brother of Ferdinand, from whom it was claimed by descent, and adjudged to its present possessor, his grace the duke of Athol.

This island, from its situation directly in the mouth of the channel, is very beneficial to Britain, by lessening the force of the tides, which would otherwise break with far greater violence than they do at present. The air is sharp, but the winters are not severe; frosts seldom happen, and are of no great continuance; neither does snow lie long upon the ground. But they are frequently exposed to very high winds, and at other times to mists, which, however, are not at all unwholesome. The soil towards the north is dry and sandy, of consequence unfertile, but not unimprovable; the mountains, which may include near two-thirds of the island, are bleak and barren; yet afford excellent peat, and contain several kinds of metals. They maintain also a kind of small swine, called *puars*, which are esteemed excellent pork. In the valleys there is good pasture, hay, and corn, as in any of the northern counties; and the southern part of the island is as fine soil as can be wished. They have marl and lime-stone sufficient to render even their poorest lands fertile; excellent slate, rag-stone, black marble, and some other kinds for building. They have vegetables of all sorts, and in the utmost perfection; potatoes in immense quantities; and, where proper pains have been taken, they have tolerable fruit. They have also hemp, flax, large crops of oats and barley, and some wheat. Hogs, sheep, goats, black cattle, and horses, they have in plenty; and, tho' small in size, yet if the country was thoroughly and skilfully cultivated, they might improve the breed of all animals, as experience has shown. They have rabbits and hares very fat and fine; tame and wild fowl in great plenty; and in their high mountains they have one airy of eagles, and two of excellent hawks. Their rivulets furnish them with salmon,

trout, eels, and other kinds of fresh-water fish; on their coasts are caught cod, turbot, ling, halibut, all sorts of shell-fish, (oysters only are scarce, but large and good), and herrings, of which they made anciently a great profit, though this fishery is of late much declined.

The commodities of this island are not many in number, nor of great value. Their slates are esteemed not inferior to any; their black marble is very hard, and bears a fine polish; and, occasionally, they export some of each, as they formerly did a little grain, and a considerable quantity of ale; but, of late years, both have been found hardly equal to the home-consumption. The rest are lambs-wool, hides, tallow, fish-oil, wax, and honey.

The inhabitants of Man, though far from being unmixed, were, perhaps, till within the course of the present century, more so than any other under the dominion of the crown of Great Britain; to which they are very proud of being subjects, though, like the inhabitants of Jersey and Guernsey, they have a constitution of their own, and a peculiarity of manners naturally resulting from a long enjoyment of it.—The Manks tongue is the only one spoken by the common people. It is the old British, mingled with Norse, or the Norwegian language, and the modern language. The clergy preach and read the common prayer in it; however, a short catechism, carefully taught in the schools, is the only printed book they have. In ancient times they were distinguished by their stature, courage, and great skill in maritime affairs. They are at this day a brisk, lively, hardy, industrious, and well-meaning people. Their frugality defends them from want; and though there are few that abound, there are as few in distress; and those that are, meet with a cheerful unconstrained relief. On the other hand, they are choleric, loquacious, and as the law till lately was cheap, and unencumbered with solicitors and attorneys, not a little litigious. The revenue, in the earl of Derby's time, amounted to about 2500 l. a-year; from which, deducting his civil list, which was about 700 l. the clear income amounted to 1800 l. At the same time the number of his subjects was computed at 20,000.—The sovereign of Man, though he has long ago waived the title of king, was still invested with regal rights and prerogatives; but the distinct jurisdiction of this little subordinate royalty, being found inconvenient for the purposes of public justice, and for the revenue, (it affording a commodious asylum for debtors, outlaws, and smugglers), authority was given to the treasury, by stat. 12. Geo. I. c. 28. to purchase the interest of the then proprietors for the use of the crown: which purchase was at length completed in the year 1765, and confirmed by stat. 5. Geo. III. c. 26. and 39.; whereby the whole island and all its dependencies, (except the landed property of the Athol family), their manorial rights and emoluments, and the patronage of the bishopric and other ecclesiastical benefices, are unalienably vested in the crown, and subjected to the regulation of the British excise and customs.

**MANAGE.** See **MANAGE.**

**MANATI,** in zoology. See **TRICHECUS.**

**MANCA,** was a square piece of gold coin, commonly valued at 30 pence; and *manca* was as much

**Man**  
**Manca.**

**Mancancel** as a mark of silver, having its name from *manu-culus*, being coined with the hand. *Leg. Canut.* But the *manca* and *mancula* were not always of that value; for sometimes the former was valued at six shillings, and the latter, as used by the English Saxons, was equal in value to our half-crown. *Manca sex solidis æstimetur.* *Leg. H. 1. c. 69.* Thorn, in his chronicle, tells us, that *mancula est pondus duorum solidorum et sex denariorum*; and with him agrees Du Cange, who says, that 20 *manca* make 50 shillings. *Manca* and *mancula* are promiscuously used in the old books for the same money.

**MANCANCEL** or **MANCHENEEL**. See **HIPPO-MANE**.

**MANCHA**, a territory of Spain in the province of New Castile, lying between the river Guadiana and Andalusia. It is a mountainous country; and it was here that the famous Don Quixote was supposed to perform his exploits.

**MANCHESTER**, a town of Lancashire in England, situated in W. Long. 2. 42. N. Lat. 53. 27.—Of this place the Rev<sup>d</sup> Mr Whitaker has published a history in two octavo volumes; but as he does not confine himself merely to the town of Manchester, but takes in many particulars of the history and antiquities of other parts of Britain, and even Ireland, his work is incapable of abridgement; though in many places of this Dictionary we have made excerpts from particular passages of it.—He conjectures that the station was first occupied by the Britions about 500 B. C. but that it first received any thing like the form of a town 450 years after, or 50 B. C. when the Britons of Cheshire made an irruption into the territories of their southern neighbours, and of consequence alarmed the Seltuntii, or inhabitants of Lancashire, so much, that they began to build fortresses in order to defend their country. Its British name was *Mancenion*, which was changed by the Romans, who conquered it under Agricola, A. D. 79, into *Mancunium*; from whence comes the present name of *Manchester*.

The town is now very populous, large, and flourishing, and has several curious manufactures, known at London by the name of *Manchester goods*. Their velvets are lately come into great repute, and are much made use of for breeches. Its chief ornaments are the college, the market-place, and the collegiate church; which last has a small choir of excellent workmanship. There is also an elegant exchange, and a stone-bridge over the river Irwell, the arches of which are extremely high, on account of the nature of the river; which, descending from the mountainous part of the country, sometimes rises four or five yards in one night.—The town sends no members to parliament, but has the title of a duchy.

**MANCIPLE** (*manceps*), a clerk of the kitchen, or caterer; and an officer in the inner temple was anciently so called, who is now the steward there; of whom Chaucer, the ancient English poet, some time a student of that house thus writes:

A manciple there was within the temple,  
Of which all caterers might take example.

This officer still remains in colleges, in the universities.

**MANDAMUS**, in law, a writ that issues out of the court of king's-bench, sent to a corporation, com-

manding them to admit or restore a person to his office. This writ also lies where justices of the peace refuse to admit a person to take the oaths in order to qualify himself for enjoying any post or office; or where a bishop or archdeacon refuses to grant a probate of a will, to admit an executor to prove it, or to swear a church-warden, &c.

**MANDARINS**, a name given to the magistrates and governors of provinces in China, who are chosen out of the most learned men, and whose government is always at a great distance from the place of their birth. Mandarin is also a name given by the Chinese to the learned language of the country; for besides the language peculiar to every province, there is one common to all the learned in the empire, which is in China what Latin is in Europe; this is called the *mandarin tongue*, or the *language of the court*.

**MANDATE**, in law, a judicial commandment to do something. See the article **MANDAMUS**.

**MANDATE**, in the canon law, a rescript of the pope, commanding an ordinary collator to put the person therein named in possession of the first vacant benefice in his collation.

**MANDERSCHIEIT**, a town of Germany in the circle of the Lower Rhine, and in the electorate of Triers, capital of a county of the same name, between the diocese of Triers and the duchy of Juliers. E. Long. 6. 32. N. Lat. 50. 20.

**MANDEVILLE** (Sir John), a physician, famous for his travels, was born at St Alban's, about the beginning of the fourteenth century. He had a liberal education, and applied himself to the study of physic; but being at length seized with an invincible desire of seeing distant parts of the globe, he left England in 1332, and did not return till 34 years after. His friends, who had long supposed him dead, did not know him when he appeared. He had travelled through almost all the east, and made himself master of a great variety of languages. He particularly visited Scythia, Armenia the Greater and Less, Egypt, Arabia, Syria, Media, Mesopotamia, Persia, Chaldaea, Greece, Dalmatia, &c. His rambling disposition did not suffer him to rest; for he left his own country a second time, and died at Liege in the Netherlands, in 1372. He wrote an Itinerary, or an account of his travels, in English, French, and Latin.

**MANDEVILLE** (Bernard de), an eminent writer in the eighteenth century, was born in Holland, where he studied physic, and took the degree of doctor in that faculty. He afterwards came over into England, and in 1714 published a poem, intitled, "The Grumbling Hive, or Knaves turned honest;" upon which he afterwards wrote remarks, and published the whole at London, 1723, in 8vo, under the title of, "The Fable of the Bees, or private Vice made public Benefits; with an Essay on Charity and Charity-schools, and a Search into the Nature of Society." This book was presented by the jury of Middlesex in July the same year, and severely animadverted upon in "A letter to the Right Honourable Lord C. printed in the London Journal of Saturday July 27. 1723." Our author published a vindication. His book was attacked by several writers, He published other pieces, and died in 1724.

Manganese

MANDRAKE, in botany. See ATROPA.

MANE, the hair hanging down from a horse's neck; which should be long, thin, and fine; and if frizzled, so much the better.

MANEGE, or MANAGE, the exercise of riding the great horse; or the ground set apart for that purpose; which is sometimes covered, for continuing the exercise in bad weather; and sometimes open, in order to give more liberty and freedom both to the horseman and horse. See HORSEMANSHIP.

The word is borrowed from the French *manage*, and that from the Italian *maneggio*; or, as some will have it, a *manu agendo*, acting with the hand.

MANES, in the Pagan system of theology, a general name for the infernal deities or gods of hell.—The ancients comprehended under manes not only Pluto, Proserpine, and Minos; but the souls likewise of the deceased were taken into the number, and esteemed gods of hell. It was usual to erect altars and offer libations to the manes of deceased friends and relations. One branch of the magic art among the Pagans consisted in consulting the manes of the dead in matters of importance; this was called *necromancy*. See NECROMANCY.

MANES, the founder of the Manichean system. See MANICHEUS.

MANGANESE, or MAGNESIA NIGRA; a mineral substance used in the tinging of glass. It is dense, ponderous, and heavy; in its purest and finest pieces approaching greatly to the colour of *lapis hematites*, being composed of regular parallel strise, diverging from a centre to the circumference. There is another kind, however, more common, of an iron-grey colour, and irregularly streaked like the steel-grained lead-ores.

But the most common manganese is entirely of an irregular structure. It is very heavy, moderately hard, and of a deep dusky grey, approaching to black; tho' sometimes of a ferruginous brown. It is found in many parts of England and Germany, in large masses, of a rude, rugged, and unequal surface. It is commonly supposed to be an ore of iron: but the experiments of Mr Pott and Mr Cronstedt shew, that this stone contains little or no iron; and therefore the latter author has made a distinct order of this earth, which he calls *terra magnesica*. It has the following properties: 1. It does not effervesce with acids, tho' they dissolve some part of it, especially when it is calcined: spirit of vitriol acquires from it a rose-colour: aqua regia also acquires colour, especially from the black kind. From these solutions fixed alkalies precipitate a white earth. 2. A small quantity of this earth mixed with glass-frit, gives red or purplish colours to the glass: larger quantities give a deep purple, or even a black. Dr Lewis tells us, that preparations of iron, whose colour in glass, in a dilute state, is sometimes yellow, and sometimes greenish or bluish, are always of a dark brown or black when the glass is overdoled with them: hence many of the ferruginous earthen and stones melt into a black glass; as the coloured clays, several slates, and the stone called *whynny-stone*. Black glasses or enamels made on this principle, have, however, like the concentrated vegetable liquids, one imperfection; that though of a deep black colour when in masses of any considerable thickness, yet, when spread thin, they always betray some of the original

colour, or of the particular hue which they would have if the colouring matter was in less quantity. To this inconvenience the black glass made with manganese is likewise subject: and therefore the best method of obtaining a perfect black, is by mixing two or more of the above-mentioned darkening materials; and instead of taking colourless glass or enamel for the basis, to use fragments of different-coloured pieces, or compositions which have been spoiled in trying to tinge them of other colours.—The common black glass of which beads are made, is coloured with manganese only; and hence, when powdered, it looks of a dirty purple: the most perfect black used by the enamellers is composed of manganese, saffre, and scales of iron. Manganese is also used to give a glazing to pottery. 3. Fused with nitre, or with fixed alkali; it gives to warm water various colours, green, purple, red, or blue; which change by agitating the water. 4. Cronstedt affirms, that it deflagrates with nitre; Pott says it does not. 5. Cronstedt says, that he has sometimes extracted a small quantity of tin from manganese. 6. The same author affirms, that the colours given by manganese to glass are easily destroyed by arsenic, or calces of tin. 7. Dr Lewis suspects, that it may increase the fusibility of glass. An ingenious friend, he tells us, observed, that in making impressions in different kinds of glass, he found this black sort to be by far the most fusible of any. 8. When manganese is fused with glass, a strong effervescence ensues, whence it may be presumed that these two substances act violently on each other.

MANETHO, an ancient Egyptian historian, who pretended to take all his accounts from the sacred inscriptions on the pillars of Hermes Trismegistus. He was high-priest of Heliopolis in the time of Ptolemy Philadelphus, at whose request he wrote his history in Greek; beginning from their gods, and continuing it down to near the time of Darius Codomanus who was conquered by Alexander the Great. His history of Egypt is a celebrated work, that is often quoted by Josephus and other ancient authors. Julius Africanus gave an abridgement of it in his Chronology. Manetho's work is however lost; and there only remain some fragments extracted from Julius Africanus, which are to be found in Eusebius's *Chronica*.

MANFREDI (Eustachio), a celebrated mathematician, born at Bologna in 1674, where he was elected mathematical professor in 1698. He was made a member of several academies, and acquired great reputation by his *Ephemerides*, 4 vols 4to, as well as by other works. He died in 1739.

MANGE, in dogs. See *Diseases of Dogs*.

MANGE, in farriery. See *tract*, § xix.

MANGER, is a raised trough under the rack in the stall, made for receiving the grain or corn that a horse eats.

MANGER, a small apartment, extending athwart the lower-deck of a ship of war, immediately within the haufe-holes, and fenced on the after part by a partition, which separates it from the other part of the deck behind it. This partition serves as a fence to interrupt the passage of the water, which occasionally gushes in at the haufe-holes, or falls from the wet cable whilst it is heaved in by the capstern. The water, thus prevented from running aft, is immediately returned into the

Manetho

Manger.

Manget  
Manichees

the sea by several small channels, called *scuppers*, cut thro' the ship's side within the manger. The manger is therefore particularly useful in giving a contrary direction to the water that enters at the haufe-holes, which would otherwise run aft in great streams upon the lower deck, and render it extremely wet and uncomfortable, particularly in tempestuous weather, to the men who mels and sleep in different parts thereof.

MANGET (John-James), an eminent physician, born at Geneva in 1652. The elector of Brandenburg made him his first physician in 1699; in which post he continued till his death, which happened at Geneva in 1742. He wrote many works; the most known of which are, 1. A collection of several Pharmacopœias, in folio. 2. *Bibliotheca pharmaceutico-medica*. 3. *Bibliotheca anatomica*. 4. *Bibliotheca chemica*. 5. *Bibliotheca chirurgica*. 6. A bibliotheca of all the authors who have written on medicine, in 4 vols folio. All these works are in Latin. Daniel le Clerc, the author of a history of phyfic, assisted him in writing them.

MANGIFERA, the MANGO-TREE; a genus of the monogynia order, belonging to the pentandria class of plants. There is but one species, a native of many parts of the East Indies, whence it has been transplanted to Brazil, and other warm parts of America. It grows to a large size; the wood is brittle, the bark rough when old; the leaves are seven or eight inches long, and more than two inches broad. The flowers are produced in loose panicles at the ends of the branches, and are succeeded by large oblong kidney-shaped plums. This fruit, when fully ripe, is greatly esteemed in the countries where it grows; but in Europe we have only the unripe fruit brought over in pickle. All attempts to propagate the plant have hitherto proved ineffectual; and Mr Miller is of opinion that the stones will not vegetate unless they are planted soon after they are ripe. He thinks therefore that the young plants ought to be brought over in boxes of earth; after which they may be kept in the tan-bed of the stove.

MANGROVE. See RHIZOPHORA.

MANHEIM, a town of Germany, in the Lower Palatinate, with a very strong citadel, and a palace, where the elector Palatine often resides. It is seated at the confluence of the rivers Neckar and Rhine, in E. Long. 8. 33. N. Lat. 49. 25.

MANIA, or MADNESS. See (the *Index* subjoined to) MEDICINE.

MANICHEES, or MANICHEANS, Christian heretics, in the third century; followers of Manes, who made his appearance in the time of the emperor Probus. The history of this heresarch is very extraordinary, and is briefly as follows.

One Terebinthus, a disciple of Scythianus a magician, having retired out of Palestine into Persia, and finding his opinions and enterprizes opposed by the priests and learned men of that country, was obliged to shelter himself in the house of a widow woman, where he was murdered. This woman being heirs to the money and books of Terebinthus, bought a slave named *Cubricus*, whom she afterwards adopted, and had him instructed in all the sciences of Persia. This man, after the death of the widow, changed his name, to blot out the memory of his former condition,

and took that of *Manes*, which, in the Persian language, signifies a *vessel*.

Some time after, from the books of Terebinthus, he began to broach an imposture, pretending to be the *Comforter* whom our Saviour promised to send into the world. This drew to him many followers, and he became the head of a numerous sect. He taught his disciples, that there are two principles, the one the author of all good, and the other the author of all evil: a doctrine which he borrowed from the Persian Magi.

Manes indulged his disciples in all manner of impurities, and forbade them to give alms to or assist any who were not of their own sect. He gave out, that the souls of his followers passed thro' the elements to the moon, and from thence to the sun, to be purified; and then went to God, and were re-united with his essence: as for the souls of all other men, they either went to hell, or were sent into other bodies. He alleged, that Christ had his residence in the sun, the Holy Ghost in the air, Wisdom in the moon, and the Father in the abyss of light. He denied the resurrection, and condemned marriage. He forbade the use of eggs, cheese, milk, and wine, as creatures proceeding from the bad principle. He used a different form of baptism from that of the church. He taught, that magistrates were not to be obeyed, and condemned the most lawful wars.

It would be tedious to rehearse all the impious tenets of this heresiarch and his followers, of whom pope Leo used to say, that the devil, who reigned in all other heresies, had built a sortres and raised his throne in that of the Manichees, who embraced all the errors and impieties that the spirit of man is capable of.

The death of this heresiarch was as dreadful as his life was impious. The king of Persia's son being sick, Manes undertook to cure him; upon which the father dismissed the physicians, and the patient died. Manes was thrown into prison, out of which he made his escape; but was soon after apprehended by the king's servants, who caused him to be sead alive, and his carcase thrown to the wild beasts.

The Manichees were divided into the *hearers* and the *elect*. Out of the latter they chose 12, in imitation of the 12 apostles: these were called *masters*. There was a 13th, who was a kind of patriarch, or pope, among them. In the fourth century, the emperors made severe laws against these heretics, and a council was held against them at Rome.

Although the Manichees professed to receive the books of the New Testament, yet, in effect, they took only so much of them as suited with their opinions, rejecting the rest as foisted in by later writers. They published several apocryphal books, which they ascribed to the apostles.

The oriental writers tell us, that Manes, being desirous of passing among his followers for something more than human, shut himself up in a grotto, into which he had secretly conveyed provisions for a year; telling his disciples he was going to take a journey to heaven, and that he would return at the end of the year. Accordingly, when the year was expired, he came out of his retirement, bringing with him a book full of extraordinary images and figures, which he pretended to have received in heaven. This book they call

Manicor-  
don  
Manila.

call *ergen* and *esfen*.

MANICORDON, or MANICHORN, a musical instrument in form of a spinet; the strings of which, like those of the clarichord, are covered with little pieces of cloth, to deaden as well as to soften their sound, whence it is also called the *dumb-spinet*.

MANIFESTO; a public declaration made by a prince in writing, showing his intentions to begin a war or other enterprise, with the motives that induce him to it, and the reasons on which he founds his rights and pretensions.

MANIHOT, or MANIOC. See JATROPHA.

MANILA, LUCONIA, or Luzon, the name of the largest of the Philippine islands in the East Indies, subject to Spain. It had the name of *Luzon* from a custom that prevailed among the natives of beating or bruising their rice in wooden mortars, before they either boiled or baked it; *luzon*, in their language, signifying a mortar.

As to situation, it is remarkably happy, lying between the eastern and western continents, and having China on the north, at the distance of about 60 leagues; the islands of Japan on the north-east, at the distance of about 250 leagues from the nearest of them; the ocean on the east; the other islands on the south; and on the west Malacca, Patana, Siam, Cambodia, Cochhin-China, and other provinces of India, the nearest at the distance of 300 leagues.

The middle of this island is in the latitude  $15^{\circ}$  north; the east point in  $13^{\circ} 30'$ , and the most northern point in  $19^{\circ}$ . The shape of it is said to resemble that of an arm bent; the whole length being about 160 Spanish leagues, the greatest breadth between 30 and 40, and the circumference about 350. As to the longitude, the charts differ, some making the middle of the island to lie  $113^{\circ}$  east from London, and others in  $160^{\circ}$ . The climate is hot and moist. One thing is held very extraordinary, that in stormy weather there is much lightning and rain, and that thunder is seldom heard till this is over. During the months of June, July, August, and part of September, the west and south winds blow, which they call *vendavales*, bringing such rains and storms, that the fields are all overflowed, and they are forced to have little boats to go from one place to another. From October till the middle of December, the north wind prevails; and from that time till May, the east and south-east; which winds are there called *breezes*. Thus there are two seasons in those seas, by the Portuguese called *mon-zuns*; whence our word *monsoons*, that is, the breezes half the year, with a serene dry air; and the *vendavales* the other half, wet and stormy. It is further to be observed, that in this climate no vermin breed upon Europeans, though they wear dirty shirts, whereas it is otherwise with the Indians. The days here being always of an equal length, and the weather never cold, neither their clothes, nor the hour of dining, supping, doing business, studying, or praying, are ever changed; nor is cloth worn, but only against the rain.

The air here being, as has been observed, very hot and moist, is not wholesome; but is worse for young men, that come from Europe, than for the old. As for the natives, without using many precautions, they live very commonly to fourscore or 100. The soil is so

rich, that rice grows even on the tops of the mountains, without being watered; and this makes it so plentiful, that the Indians value gold so little as not to pick it up, though it lies almost every where under their feet.

Among the disadvantages of the island, besides frequent and terrible earthquakes, here are several burning mountains. The face of the island, however, is far from being disfigured by them, or by the consequences of their explosions.

The mountaineers, called *Tingiani*, have no particular place of abode, but always live under the shelter of trees, which serve them instead of houses, and furnish them with food; and when the fruit is eaten up, they remove where there is a fresh fort.

Here are 40 different sorts of palm-trees, the most excellent cocoas, wild cinnamon, wild nutmegs, and some say wild cloves also; ebony; sandal-wood; and the best cassia, and in such plenty, that they feed their hogs with its fruit; all kinds of cattle, and prodigious quantities of gold, amber, and ambergrief.

There are several forts of people in this island besides the Spaniards, as the Tagalians or Tagaleze, the Pintadoes or painted negroes, the Ilayas or Tinglianos, and the Negrellos. The Tagalians, who are thought to be Malayans by descent, are a modest, tractable, and well-disposed people. The Pintadoes, or painted negroes, are tall, straight, strong, active, and of an excellent disposition. The Tinglianos, whom some suppose to be descended from the Japanese, are very brave, yet very courteous and humane. They live entirely on the gifts of nature; and never sleep under any other shade than that of the trees or a cave. The Negrellos, who are held to be the Aborigines of the island, are barbarous and brutal to the last degree. When they kill a Spaniard, they make a cup of his skull and drink out of it.

This island is divided into several provinces, containing divers towns, the chief of which are Manila, Caceres, New-Segovia, Bondo, Passacao, Ibalon, Bulaw, Serfocon, or Bagatao, Lampon, Ferdinandina, Bolinao, Playahonda, Cavite, Mindora, Caleleya, and Balayan.

MANILA, the capital of an island of the same name in the East Indies, on the south-east side of the island, where a large river falls into the sea, and forms a noble bay 30 leagues in compass, to which the Spaniards have given the name of *Bahia*, because the river runs out of the great lake Bahi, which lies at the distance of six leagues behind it. In compass it is two miles, in length one third of a mile; the shape irregular, being narrow at both ends, and wide in the middle. On the south it is washed by the sea, and on the north and east by the river; being also strongly fortified with walls, bastions, forts, and batteries.—Manila contains about 30,000 souls, who are a very motley race, distinguished by several strange names, and produced by the conjunction of Spaniards, Chinese, Malabars, Blacks, and others inhabiting the city and islands depending on it. Without the walls are large suburbs, particularly that inhabited by the Chinese merchants, called *Sangleys*. In proportion to the size of the place, the number of churches and religious houses is very great. Only small vessels can up to Manila; but three leagues south of it is the town and port of Cavite, defended by the

Manila.

Manila.

the castle of St Philip and capable of receiving the largest ships. Here stands the arsenal where the galleons are built, for which there are from 300 to 600 or 800 men constantly employed, who are relieved every month, and while upon duty are maintained at the king's expence. By an earthquake which happened here in 1645, a third part of the city of Manila was destroyed, and no less than 3000 people perished in the ruins.

In the late war, Spain having entered into engagements with France, in consequence of the family compact of the house of Bourbon, it was found expedient by Britain to declare war also against Spain. Whereupon a force was sent out from our East-India settlements, particularly Madras, for the conquest of the Philippine Islands, under general Draper and admiral Cornish: who, after a siege of 12 days, took Manila, on the 6th of October 1762, by storm; but, to save so fine a city from destruction, agreed to accept a ransom, amounting to a million sterling, a part of which, it is said, was never paid. The Spanish viceroy resides in this city, and lives like a sovereign prince. The government is said to be one of the best in the gift of the king of Spain. When the city was taken, as above, the archbishop, who is a kind of pope in this part of the world, was also viceroy. Five large ships, loaded with the riches of the East, as diamonds from Golconda, cinnamon from Ceylon, pepper from Sumatra and Java, cloves and nutmegs from the Moluccas and Banda islands, camphire from Borneo, benjamin and ivory from Cambodia, silks, tea, and china-ware from China, &c. sail yearly from hence to Acapulco in Mexico, and return freighted with silver, making 400 per cent. profit.

The city of Manila is governed by two alcaldes: the rest of the cities and great towns have each an alcalde; and in every village there is a corregidore. Appeals from their sentences are made to the royal court at Manila, in which there are four judges, and a fiscal or attorney-general; each of these judges has a salary of 3300 pieces of eight per annum. The viceroy is president; and in that quality has an income of 4000 pieces of eight, but he has no vote; yet if the judges are equally divided, the president names a doctor of the civil law, who, in virtue of his appointment, has a decisive voice. The attorney-general, in right of his office, is protector of the Chinese, in consideration of which he receives 600 pieces of eight every year. As for the Indians that are in subjection, they pay tribute in the following proportions: Young men from 18, and from thence, if they continue single, to the age of 60, pay five rials of plate by way of capitation; as single women likewise do from 24 to 50: married men pay ten rials. It is computed, that there are within the compass of this government 250,000 Indians, subject to his Catholic majesty, of whom two-fifths hold immediately from the king, and the rest from lords or proprietors, who pay two rials each for the maintenance of the forces, and the like sum for the parish-priest. The royal revenue is computed at about half a million of pieces of eight, exclusive of casualties. In regard to the military establishment, the garrison of Manila consists of about 800 or 1000 men, and there are about 3000 more in the Philippines. The viceroy is by his office cap-

tain-general, with a salary of about 4000 pieces of eight.

MANILIUS (Marcus), a Latin poet, whose poem had the ill luck to lie buried in some German libraries, and was not heard of in the world, until Poggius, about two centuries ago, published him from some old manuscripts he found there. There is no account to be found of him but what can be drawn from his poem, which is called *Astronomicum*; and contains a system of the ancient astronomy and astrology, together with the philosophy of the Stoics. It consists of five books; though there was a sixth, which has not been recovered. From the style, and no mention of the author being found in ancient writers, it is probable he died young. It is collected, however, that he was a Roman of illustrious extraction, and lived under the reign of Augustus, whom he invokes, though not by name, yet by circumstances and character that suit no other emperor. The best editions of Manilius are, that of Joseph Scaliger in 1600, and that of Bentley at London in 1738.

MANILLE, in commerce, a large brafs ring in the form of a bracelet, either plain or engraven, flat or round.

Manilles are the principal commodities which the Europeans carry to the coast of Africa, and exchange with the natives for slaves. These people wear them as ornaments on the small of the leg, and on the thick part of the arm above the elbow. The great men wear manilles of gold and silver; but these are made in the country by the natives themselves.

MANIOC, or MANIHOT. See JATROPHA.

MANIPULUS, in Roman antiquity, a body of infantry, consisting of 200 men, and constituting the third part of a cohort. See COHORT.

Among physicians, the term *manipulus* signifies a handful of herbs or leaves, or so much as a man can grasp in his hand at once; which quantity is frequently denoted by the abbreviation, M, or m.

MANIS, the SCALY LIZARD, in zoology, a genus of quadrupeds belonging to the order of bruta, the characters of which are these: They have no foreteeth either in the upper or under jaw; the tongue is long and cylindrical; the snout is long and narrow; and the body is covered with hard scales. There are two species: 1. The pentadactyla, or scaly lizard, with five toes on each foot. The head is smaller than the neck; the eyes are very small; the length of the body including the tail, is from six to eight feet. The whole body is covered with hard scales, excepting the under-part of the head and neck, the breast, the belly, and the internal side of each leg. Between the scales of this animal there are some hairs like the bristles of a hog, brownish at the points. The scales are of a reddish colour, very hard, convex above, and concave below. All the parts which want scales are naked. The scales are unconnected; and the animal can raise or lower them at pleasure, like the quills of the porcupine. When irritated, he erects his scales, and rolls himself up like a hedge-hog. In this situation, neither the lion, tiger, nor any other animal can hurt him. It is said to destroy the elephant by twisting itself round his trunk, and compressing that tender organ with its hard scales. It feeds on lizards and insects; turns up the ground with its nose; walks with  
its

Manilius

Manilis

Manley  
 or  
 Manlius.

its claws bent under its feet; grows very fat; and is esteemed delicate eating; makes no other noise than a kind of snorting. It is a mild inoffensive creature, is slow of motion, and has no other method of escaping the pursuit of man, but by concealing himself in crannies of rocks, and in holes which they dig in the ground, and where they likewise bring forth their young. It is a native of the East Indies, and is very rare. Mr Pennant conjectures that it may be a native of Guinea; the *qnegeli* of the Negroes, which, Des Marchais says, grows to the length of eight feet, of which the tail is four. It lives in woods and marshy places; feeds on ants, which it takes by laying its long tongue across their paths, which is covered with a viscid saliva, so that the insects which attempt to pass over it cannot extricate themselves.

2. The tetradactyla, or scaly lizard with four toes on each foot. This species is very similar to the former; only the tail of it is much longer in proportion to the body; and such parts as want scales, instead of being naked, are covered with a soft hair. It is also found in the East Indies. See Plate CLXII. fig. 4.

MANLEY (Mrs.) the celebrated writer of the *Atalantis*, was the daughter of Sir Roger Manley, the reputed author of the first volume of the *Turkish Spy*. She lost her parents very early; and after having been deluded into a false marriage by her guardian, who was her cousin, and afterwards deserted her, she was patronized by the duchess of Cleveland, mistress of Charles II. But the duchess, being a woman of a very fickle temper, grew tired of Mrs Manley in six months time; and discharged her upon a pretence, whether groundless or not is uncertain, that she intrigued with her son. After this she wrote her first tragedy, called *Royal Mischief*, which was acted with great applause in 1696; and her apartment being frequented by men of wit and gaiety, the soon engaged in amours, and was taken into keeping. Her pen now grew as licentious as her conduct: for, in her retired hours, she wrote four volumes, called *Memoirs of the New Atalantis*; in which she was not only very free in her wanton tales of love-adventures, but satirized the characters of many distinguished personages, especially those who had a principal concern in the Revolution. A prosecution was commenced against her for this work; but whether those in power were ashamed to bring a woman to trial for a few amorous trifles, or whether the laws could not reach her disguised satire, she was discharged; and a total change of the ministry ensuing, Mrs Manley lived in high reputation and gaiety, amusing herself with the conversation of wits, and writing plays, poems, and letters. She died in 1724.

MANLIUS (Capitolinus), the renowned Roman consul and general, who saved the capitol when it was attacked by the Gauls in the night: he was alarmed by the cries of geese, which were ever after held sacred. But being afterwards accused of aspiring at the sovereignty, he was thrown from the top of the capitol, 384 B. C. See GAUL and ROME.

MANLIUS (Torquatus), a celebrated consul and Roman captain; had great wit, but a difficulty in expressing himself, which induced Manlius Imperiosus, his father, to keep him almost by force in the country. Pompey, tribune of the people, enraged at this in-

stance of severity, formed a design of accusing Manlius the father before the judges; but Torquatus being informed of it, went to that tribune, and, with a poniard in his hand, made him swear that he would not proceed in that accusation against him to whom he owed his life. At length Torquatus was made military tribune, and killed a soldier of the Gauls in single combat, from whom he took a gold chain that he wore about his neck. From this action he obtained the name of *Torquatus*. He was consul in the war against the Latins; when he ordered his own son to be beheaded, for fighting contrary to his orders, tho' he had gained the victory. He conquered the enemies of the republic, and was several times made consul; but at last refused the consulship, saying, That it was no more possible for him to bear with the vices of the people, than it was for the people to bear with his severity.

MANNA, in the materia medica, the juice of certain trees of the ark kind, either naturally concreted on the plants, or exsiccated and purified by art. There are several sorts of manna in the shops. The larger pieces, called *flake manna*, are usually preferred; though the smaller grains are equally good, provided they are white, or of a pale yellow colour; very light, of a sweet, not unpleasant taste, and free from any visible impurities. Some people judiciously prefer the fat honey-like manna to the foregoing; this has either been exposed to a moist air, or damaged by sea or other water. This kind of manna is said to be sometimes counterfeited by a composition of sugar and honey, mixed with a little scammony; there is also a facitious manna, which is white and dry, said to be composed of sugar, manna, and some purgative ingredient, boiled to a proper consistence. This may be distinguished by its weight, solidity, untransparent whiteness, and by its taste, which is different from that of manna.

Manna is a mild, agreeable laxative; and may be given with safety to children and pregnant women: nevertheless, in some particular constitutions, it acts very unkindly, producing flatulencies and distensions of the viscera: these inconveniences may be prevented by the addition of any grateful warm aromatic. It operates so weakly, that it does not produce the full effect of a cathartic, unless taken in large doses; and hence it is rarely given in this intention by itself. It may be commodiously dissolved in the purging mineral waters, or joined to the cathartic salts, fenna, rhubarb, or the like. Geoffroy recommends acuating it with a few grains of emetic tartar: by this management, he says, bilious serum will be plentifully evacuated, without any nausea, gripes, or other inconvenience. It is remarkable, that the efficacy of this drug is greatly promoted, (if the account of Vallinieri is to be relied on) by a substance which is itself very slow of operation, viz. calia. See CASIA.

MANNA, is also a Scripture-term, signifying a miraculous kind of food which fell from heaven for the support of the Israelites in their passage through the wilderness, being in form of coriander-seeds, its colour like that of bdellium, and its taste like honey.

They called it *manna*, either from the Hebrew word *manah*, a "gift," to intimate its being a gift from heaven; or from *minnah*, which signifies "to prepare," because the manna came to them ready for eating, and needed

needed no preparation but gathering; or from the Egyptian word, *man*, "what is it?" which last etymology seems the more probable, in regard the Scripture takes notice of the surprize they were under when they first saw this new food descend.

Salmasius, however, prefers another. According to him, the Arabs and Chaldeans used the word *man* to signify a kind of dew or honey that fell on the trees, and was gathered in great abundance on mount Libanus: on which footing, the Israelites did not use the term *manna* out of surprize, but because they found this food fall with the dew, in the same manner as the honey so well known under the name of *man*.

Salmasius adds, that the manna of the Israelites was in reality no other than that honey or dew condensed; and that the one and the other were the same with the wild honey wherewith St John was fed in the wilderness. So that the miracle did not consist in the formation of any new substance in favour of the Israelites; but in the unusual manner in which it was dispensed by Providence for the sustenance of so vast a multitude.

\* See  
Fraxinus.

*Manna-Tree*, is a species of the ash\*, called the *fraxinus rotundifolia*, a native of Calabria in Italy. The shoots of this tree are much shorter, and the joints closer together, than those of the common ash; the small leaves are shorter, and deeper sawed on their edges, and are of a lighter green. The flowers come out from the side of the branches, which are of a purple colour, and appear in the spring before the leaves come out. This tree is of humble growth, seldom rising more than 15 or 16 feet high in this country.

**MANNER**, in painting, a habitude that a man acquires in the three principal parts of painting, the management of colours, lights and shadows; which is either good or bad according as the painter has practised more or less after the truth, with judgment and study. But the best painter is he who has no manner at all. The good or bad choice he makes is called *gout*.

**MANNERS**, the plural noun, has various significations; as, The general way of life, the morals, or habits, of any person or people; also, Ceremonious behaviour, or studied civility. See the next article.

*Good-MANNERS*, according to Swift, is the art of making those people easy with whom we converse.

Whoever makes the fewest persons uneasy, is the best bred in the company.

As the best law is founded upon reason, so are the best manners. And as some lawyers have introduced unreasonable things into common law; so likewise many teachers have introduced absurd things into common good-manners.

One principal point of this art is to suit our behaviour to the three several degrees of men; our superiors, our equals, and those below us.

For instance, to press either of the two former to eat or drink, is a breach of manners; but a tradesman or a farmer must be thus treated, or else it will be difficult to persuade them that they are welcome.

Pride, ill-nature, and want of sense, are the three great sources of ill-manners: without some one of these defects, no man will behave himself ill for want of experience; or of what, in the language of fools, is called *knowing the world*.

"I defy (proceeds our author) any one to assign an incident wherein reason will not direct us what we are to say or to do in company, if we are not misled by pride or ill-nature. Therefore, I insist that good sense is the principal foundation of good-manners; but because the former is a gift which very few among mankind are possessed of, therefore all the civilized nations of the world have agreed upon fixing some rules for common behaviour, best suited to their general customs, or fancies, as a kind of artificial good-sense to supply the defects of reason. Without which, the gentlemanly part of dunces would be perpetually at odds, as they seldom fail when they happen to be drunk, or engaged in squabbles about women or play. And, God be thanked, there hardly happeneth a duel in a year, which may not be imputed to one of those three motives. Upon which account, I should be exceedingly sorry to find the legislature make any new laws against the practice of duelling; because the methods are easy, and many, for a wife man to avoid a quarrel with honour, or engage in it with innocence. And I can discover no political evil in suffering bullies, sharpers, and rakes, to rid the world of each other by a method of their own, where the law hath not been able to find an expedient.

"As the common forms of good-manners were intended for regulating the conduct of those who have weak understandings; so they have been corrupted by the persons for whose use they were contrived. For these people have fallen into a needless and endless way of multiplying ceremonies, which have been extremely troublesome to those who practise them, and insupportable to every body else; inasmuch that wife men are often more uneasy at the over-civility of these refinements, than they could possibly be in the conversations of peasants or mechanics.

"The impertinencies of this ceremonial behaviour are nowhere better seen than at those tables where ladies preside, who value themselves upon account of their good-breeding; where a man must reckon upon passing an hour without doing any one thing he hath a mind to, unless he will be so hardy as to break through all the settled decorum of the family. She determineth what he loveth best, and how much he shall eat; and if the master of the house happeneth to be of the same disposition, he proceedeth in the same tyrannical manner to prescribe in the drinking part: at the same time you are under the necessity of answering a thousand apologies for your entertainment. And although a good deal of this humour is pretty well worn off among many people of the best fashion, yet too much of it still remaineth, especially in the country; where an honest gentleman assured me, that having been kept four days against his will at a friend's house, with all the circumstances of hiding his boots, locking up the stable, and other contrivances of the like nature, he could not remember, from the moment he came into the house, to the moment he left it, any one thing wherein his inclination was not directly contradicted; as if the whole family had entered into a combination to torment him.

"But, besides all this, it would be endless to recount the many foolish and ridiculous accidents I have observed among these unfortunate proselytes to ceremony. I have seen a duchess fairly knocked down by the precipitancy of an officious coxcomb running to

Manners.

save her the trouble of opening a door. I remember, upon a birth-day at court, a great lady was rendered utterly disconsolate, by a diff of sauce let fall by a page directly upon her head-dress and brocade, while she gave a sudden turn to her elbow upon some point of ceremony with the person who fat next her. Monsieur Buys, the Dutch envoy, whose politics and manners were much of a size, brought a son with him about 13 years old, to a great table at court. The boy and his father, whatever they put on their plates, they first offered round in order, to every person in the company; so that we could not get a minute's quiet during the whole dinner. At last their two plates happened to encounter, and with so much violence, that, being china, they broke in twenty pieces, and stained half the company with wet sweetmeats and cream.

"There is a pedantry in manners as in all arts and sciences, and sometimes in trades. Pedantry is properly the over-rating any kind of knowledge we pretend to. And if that kind of knowledge be a trifle in itself, the pedantry is the greater. For which reason I look upon fiddlers, dancing-masters, heralds, masters of the ceremony, &c. to be greater pedants than Lipfius, or the elder Scaliger. With these kind of pedants, the court, while I knew it, was always plentifully stocked: I mean from the gentleman-usher (at least) inclusive, downward to the gentleman-porter; who are, generally speaking, the most insignificant race of people that this island can afford, and with the smallest tincture of good-manners, which is the only trade they profess. For being wholly illiterate, conversing chiefly with each other, they reduce the whole system of breeding within the forms and circles of their several offices: and as they are below the notice of ministers, they live and die in court under all revolutions, with great obsequiousness to those who are in any degree of credit or favour, and with rudeness and insolence to every body else. From whence I have long concluded, that good-manners are not a plant of the court-growth: for if they were, those people who have understandings directly of a level for such acquirements, and who have served such long apprenticeships to nothing else, would certainly have picked them up. For as to the great officers who attend the prince's person or councils, or preside in his family, they are a transient body, who have no better a title to good-manners than their neighbours, nor will probably have recourse to gentlemen-ushers for instruction. So that I know little to be learned at court on this head, except in the material circumstance of dress; wherein the authority of the maids of honour must indeed be allowed to be almost equal to that of a favourite actress.

"I remember a passage my lord Bolingbroke told me: That going to receive prince Eugene of Savoy at his landing, in order to conduct him immediately to the queen, the prince said he was much concerned that he could not see her majesty that night: for Monsieur Hoffman (who was then by) had assured his highness, that he could not be admitted into her presence with a tied-up perwig; that his equipage was not arrived; and that he had endeavoured in vain to borrow a long one among all his valets and pages. My lord turned the matter to a jest, and brought the prince to her majesty: for which he was highly censured by the whole tribe of gentlemen-ushers; among whom Monsieur

Manners.

Hoffman, an old dull resident of the emperor's, had picked up this material point of ceremony; and which, I believe, was the best lesson he had learned in five and twenty years residence.

"I make a difference between *good-manners* and *good-breeding*; although, in order to vary my expression, I am sometimes forced to confound them. By the first, I only understand the art of remembering, and applying, certain settled forms of general behaviour. But *good breeding* is of a much larger extent: for besides an uncommon degree of literature sufficient to qualify a gentleman for reading a play, or a political pamphlet, it taketh in a great compass of knowledge; no less than that of dancing, fighting, gaming, making the circle of Italy, riding the great horse, and speaking French; not to mention some other secondary or subaltern accomplishments, which are more easily acquired. So that the difference between good-breeding and good-manners lieth in this, That the former cannot be attained to by the best understandings without study and labour; whereas a tolerable degree of reason will instruct us in every part of good-manners without other assistance.

"I can think of nothing more useful upon this subject, than to point out some particulars wherein the very essentials of good-manners are concerned, the neglect or perverting of which doth very much disturb the good commerce of the world, by introducing a traffic of a mutual uneasiness in most companies.

"First, a necessary part of good-manners is a punctual observance of time at our own dwellings, or those of others, or at third places; whether upon matters of civility, business, or diversion: which rule, though it be a plain dictate of common reason, yet the greatest minister I ever knew, was the greatest trespasser against it; by which all his business doubled upon him, and placed him in a continual arrear. Upon which I often used to rally him as deficient in point of good-manners. I have known more than one ambassador, and secretary of state, with a very moderate portion of intellectuals, execute their office with great success and applause, by the mere force of exactness and regularity. If you duly observe time for the service of another, it doubles the obligation; if upon your own account, it would be manifest folly, as well as ingratitude, to neglect it; if both are concerned, to make your equal or inferior attend on you to his own disadvantage, is pride and injustice.

"Ignorance of forms cannot properly be styled *ill-manners*: because forms are subject to frequent changes; and consequently, being not founded upon reason, are beneath a wise man's regard. Besides, they vary in every country; and after a short period of time vary frequently in the same: so that a man who travels, must needs be at first a stranger to them in every court through which he passeth; and perhaps, at his return, as much a stranger in his own; and, after all, they are easier to be remembered or forgotten than faces or names.

"Indeed, among the many impertinencies that superficial young men bring with them from abroad, this bigotry of forms is one of the principal, and more predominant than the rest; who look upon them not only as if they were matters capable of admitting of choice, but even as points of importance; and therefore

\* Harley  
earl of Oxford,  
lord high treasurer to  
Queen Anne.

**Manceuvre, Manoevre.** fore are zealous upon all occasions to introduce and propagate the new forms and fashions they have brought back with them: so that, usually speaking, the worst-bred person in the company, is a young traveller just arrived from abroad."

**MANOEUVRE**, in a military sense, consists solely in distributing equal motion to every part of a body of troops, to enable the whole to form, or change their position, in the most expeditious and best method, to answer the purposes required of a battalion, brigade, or line, of cavalry, artillery, or infantry. It has always been lamented, that men have been brought on service without being informed of the uses of the different manœuvres they have been practising; and, having no ideas of any thing but the uniformity of the parade, instantly fall into disorder and confusion when they lose the step, or see a deviation from the straight lines they have been accustomed to at exercise. It is a pity to see so much attention given to show, and so little to instruct the troops in what may be of use to them in real service.—No manœuvre should be executed in presence of the enemy, unless protected by some division of the troops.

**MANOMETER**, or **MANOSCOPE**, an instrument to show or measure the alterations in the rarity or density of the air. The manometer differs from the barometer in this, That the latter only serves to measure the weight of the atmosphere, or of the column of air over it; but the former, the density of the air in which it is found; which density depends not only on the weight of the atmosphere, but also on the action of heat and cold, &c. Authors, however, generally confound the two together; and Mr Boyle himself gives us a very good manometer of his contrivance, under the name of a *statical barometer*, consisting of a bubble of thin glass, about the size of an orange, which, being counterpoised when the air was in a mean state of density, by means of a nice pair of scales, sunk when the atmosphere became lighter, and rose as it grew heavier.

Another kind of manometers were made use of by colonel Roy, in his attempts to correct the errors of the barometer, and are described in the *Philosophical Transactions*, Vol. LXVII. p. 689. "They were (says he) of various lengths, from four to upwards of eight feet: they consisted of straight tubes, whose bores were commonly from  $\frac{1}{17}$ th to  $\frac{1}{13}$ th of an inch in diameter. The capacity of the tube was carefully measured, by making a column of quicksilver, about three or four inches in length, move along it from one end to the other. These spaces were severally marked, with a fine-edged file, on the tubes; and transferred from them to long slips of pasteboard, for the subsequent construction of the scales respectively belonging to each. The bulb, attached to one end of the manometer at the glass-house, was of the form of a pear, whose point being occasionally opened, dry or moist air could be readily admitted, and the bulb sealed again; without any sensible alteration in its capacity.

"The air was confined by means of a column of quicksilver, long or short, and with the bulb downwards or upwards, according to the nature of the proposed experiment. Here it must be observed, that, from the adhesion of the quicksilver to the tube, the instrument will not act truly, except it be in a vertical

position; and even then, it is necessary to give it a small degree of motion, to bring the quicksilver into its true place; where it will remain in equilibrio, between the exterior pressure of the atmosphere on one side, and the interior elastic force of the confined air on the other.

"Pounded ice and water were used to fix a freezing point on the tube; and by means of salt and ice, the air was farther condensed, generally four, and sometimes five or six degrees below zero. The thermometer and manometer were then placed in the tin vessel, among water which was brought into violent ebullition; where having remained a sufficient time, and motion being given to the manometer, a boiling point was marked thereon. After this the fire was removed, and the gradual descents of the piece of quicksilver, corresponding to every 20 degrees of temperature in the thermometer, were successively marked on a deal rod applied to the manometer. It is to be observed, that both instruments, while in the water, were in circumstances perfectly similar; that is to say, the ball and bulb were at the bottom of the vessel.

"In order to be certain that no air had escaped by the side of the quicksilver during the operation, the manometer was frequently placed a second time in melting ice. If the barometer had not altered between the beginning and end of the experiment, the quicksilver always became stationary at or near the first mark. If any sudden change had taken place in the weight of the atmosphere during that interval, the same was noted, and allowance made for it in afterwards proportioning the spaces.

"Long tubes, with bores truly cylindrical, or of any uniform figure, are scarcely ever met with. Such however as were used in these experiments, generally tapered in a pretty regular manner from one end to the other. When the bulb was downwards, and the tube narrowed that way, the column of quicksilver confining the air lengthened in the lower-half of the scale, and augmented the pressure above the mean. In the upper-half, the column being shortened, the pressure was diminished below the mean. In this case, the observed spaces both ways from the centre, were diminished in the inverse ratio of the heights of the barometer at each space, compared with its mean height. If the bore widened towards the bulb when downwards, the observed spaces, each way from the centre, were augmented in the same inverse ratio; but in the experiments on air less dense than the atmosphere, the bulb being upwards, the same equation was applied with contrary signs: and if any extraordinary irregularity took place in the tube, the corresponding spaces were preportioned both ways from that point, whether high or low, that answered to the mean.

"The observed and equated manometrical spaces being thus laid down on the pasteboard containing the measures of the tube; the 212° of the thermometer, in exact proportion to the sections of the bore, were constructed along-side of them: hence the coincidences with each other were easily seen; and the number of thermometrical degrees answering to each manometrical space readily transferred into a table prepared for the purpose."

**MANOR**, **MANERIUM**, (*à manendo*, because the usual residence of the owner,) seems to have been a

Manor.

Black.  
Commes.

district of ground, held by lords or great personages; who kept in their own hands so much land as was necessary for the use of their families, which were called *terra dominicales*, or *demesne lands*; being occupied by the lord, or *dominus manerii*, and his servants. The other, or *tenemental lands*, they distributed among their tenants; which, from the different modes of tenure, were called and distinguished by two different names.—First, *book land*, or charter-land, which was held by deed under certain rents and free services; and in effect differed nothing from free socage lands: and from hence have arisen most of the freehold tenants who hold of particular manors, and owe suit and service to the same. The other species was called *folk-land*, which was held by no assurance in writing, but distributed among the common folk or people at the pleasure of the lord, and resumed at his discretion; being indeed land held in villenage. See VILLENAGE.

The residue of the manor, being uncultivated, was termed the *lord's waste*, and served for public roads, and for common of pasture to the lord and his tenants. Manors were formerly called *baronies*, as they still are *lordships*; and each lord or baron was empowered to hold a domestic court, called the *court-baron*, for redressing misdemeanors and nufances within the manor, and for settling disputes of property among the tenants. This court is an inseparable ingredient of every manor; and if the number of suitors should so fail, as not to leave sufficient to make a jury or homage, that is, two tenants at the least, the manor itself is lost.

In the early times of our legal constitution, the king's greater barons, who had a large extent of territory held under the crown, granted out frequently smaller manors to inferior persons to be held of themselves; which do therefore now continue to be held under a superior lord, who is called in such cases the *lord paramount* over all these manors: and his feignery is frequently termed an *honour*, not a *manor*; especially if it hath belonged to an ancient feudal baron, or hath been at any time in the hands of the crown. In imitation whereof, these inferior lords began to carve out and grant to others still more minute estates, to be held as of themselves, and were so proceeding downwards *in infinitum*, till the superior lords observed, that, by this method of subinfeudation, they lost all their feudal profits of wardships, marriages, and escheats, which fell into the hands of these mesne or middle lords, who were the immediate superiors of the *terre-tenant*, or him who occupied the land; and also that the mesne lords themselves were so impoverished thereby, that they were disabled from performing their services to their own superiors. This occasioned, first, that provision in the 32d chapter of *magna charta*, 9 Hen. III. (which is not to be found in the first charter granted by that prince, nor in the great charter of king John,) that no man should either give or sell his land, without reserving sufficient to answer the demands of his lord; and, afterwards, the statute of Westm. 3. or *quæ emptores*, 18 Edw. I. c. 1. which directs, that, upon all sales, or feoffments of land, the feoffee shall hold the same, not of his immediate feoffor, but of the chief lord of the fee, of whom such feoffor himself held it. But these provisions not extending to the king's own tenants *in capite*, the

like law concerning them is declared by the statutes of *prærogativa regis*, 17 Edw. II. c. 6. and of 34 Edw. III. c. 15. by which last all subinfeudations, previous to the reign of king Edward I. were confirmed; but all subsequent to that period were left open to the king's prerogative. And from hence it is clear, that all manors existing at this day, must have existed as early as king Edward the First: for it is essential to a manor, that there be tenants who hold of the lord; and, by the operation of these statutes, no tenant *in capite* since the accession of that prince, and no tenant of a common lord since the statute of *quæ emptores*, could create any new tenants to hold of himself. See VILLENAGE.

MANS, an ancient, rich, and populous town of France, capital of the county of Maine, with a bishop's see. Its wax and stufts are famous. It is seated on a high hill near the river Sarre, in E. Long. o. 10. N. Lat. 47. 58.

MANSFELD, a city of Germany, and capital of a county of the same name, in the circle of Upper Saxony. E. Long. 12. 55. N. Lat. 51. 35.

MANSFIELD, a town of Nottinghamshire in England, seated in the forest of Sherwood. It is a pretty large town, with good houses; drives a great trade, and is famous for malt. W. Long. 1. 6. N. Lat. 53. 12.

MANSIO, a term often mentioned in itineraries, denoting *inns* on the public roads to lodge in, at the distance of eighteen miles from each other; (*Laetantius*). Also, in the lower ages, it came to denote "an encampment for one night," (*Lamprius*).

MANSIO, or *Manfus*, was sometimes also used in the same sense with *hide*; that is, for as much land as one plough could till in a year. See *HIDE*.

MANSE, MANSUS, *Manfas*, or *Manfus*; in ancient law-books, denotes an *house*, or habitation, either with or without land. See *HOUSE*, and *MANSION*. The word is formed à *manendo*, "abiding;" as being the place of dwelling or residence.

Capital MANSE, (*Manfum Capitale*), denotes the *manor-house*, or lord's court. See *MANOR*, and *COURT*.

MANSUS *Presbyteri*, is a parsonage or vicarage house for the incumbent to reside in. This was originally, and still remains, an essential part of the endowment of a parish-church, together with the glebe and tythes. It is sometimes called *Presbyterium*. See *PRESBYTERY*.

MANSION, MANSIO, a dwelling-house, or habitation, especially in the country. See *MANS*.

MANSION is more particularly used for the lord's chief dwelling-house within his fee; otherwise called the *capital messuage*, or chief manor-place. See *MANOR*.

MANSLAUGHTER, the unlawful killing of another, without malice either express or implied: Which may be either voluntarily, upon a sudden heat; or involuntarily, but in the commission of some unlawful act. These were called, in the Gothic constitutions, *homicidia vulgaria*; *quæ aut casu, aut etiam spontè committuntur, sed in subitaneo quodam iracundia calore et impetu*. And hence it follows, that in manslaughter there can be no accessories before the

Mans  
#  
Man-  
slaughter.

the fact; because it must be done without premeditation.

1. As to the first, or voluntary branch: If upon a sudden quarrel two persons fight, and one of them kills the other, this is manslaughter; and so it is, if they upon such an occasion go out and fight in a field; for this is one continued act of passion: and the law pays that regard to human frailty, as not to put a hasty and deliberate act upon the same footing with regard to guilt. So also if a man be greatly provoked, as by pulling his nose, or other great indignity, and immediately kills the aggressor, though this is not excusable *se defendendo*, since there is no absolute necessity for doing it to preserve himself; yet neither is it murder, for there is no previous malice; but it is manslaughter. But in this, and in every other case of homicide upon provocation, if there be a sufficient cooling-time for passion to subside and reason to interpose, and the person so provoked afterwards kills the other, this is deliberate revenge, and not heat of blood; and accordingly amounts to murder. So if a man takes another in the act of adultery with his wife, and kills him directly upon the spot; though this was allowed by the laws of Solon, as likewise by the Roman civil law, (if the adulterer was found in the husband's own house), and also among the ancient Goths; yet in England it is not absolutely ranked in the class of justifiable homicide, as in case of a forcible rape, but it is manslaughter. It is, however, the lowest degree of it; and therefore in such a case the court directed the burning in the hand to be gently inflicted, because there could not be a greater provocation. Manslaughter therefore, on a sudden provocation, differs from excusable homicide *se defendendo* in this: That in one case there is an apparent necessity, for self-preservation, to kill the aggressor; in the other no necessity at all, being only a sudden act of revenge.

2. The second branch, or involuntary manslaughter, differs also from homicide excusable by misadventure, in this: That misadventure always happens in consequence of a lawful act, but this species of manslaughter in consequence of an unlawful one. As if two persons play at sword and buckler, unless by the king's command, and one of them kills the other: this is manslaughter, because the original act was unlawful; but it is not murder, for the one had no intent to do the other any personal mischief. So where a person does an act, lawful in itself, but in an unlawful manner, and without due caution and circumspection; as when a workman flings down a stone or piece of timber into the street, and kills a man; this may be either misadventure, manslaughter, or murder, according to the circumstances under which the original act was done. If it were in a country village, where few passers are, and he calls out to all people to have a care, it is misadventure only: but if it were in London, or other populous towns, where people are continually passing, it is manslaughter, though he gives loud warning; and murder, if he knows of their passing and gives no warning at all, for then it is malice against all mankind. And, in general, when an involuntary killing happens in consequence of an unlawful act, it will be either murder or manslaughter, according to the nature of the act which occasioned it. If it be in prosecution of a fe-

lonious intent, or in its consequences naturally tended to bloodshed, it will be murder; but if no more was intended than a mere civil trespass, it will only amount to manslaughter.

3. As to the punishment of this degree of homicide: The crime of manslaughter amounts to felony, but within the benefit of clergy; and the offender shall be burnt in the hand, and forfeit all his goods and chattels.

But there is one species of manslaughter, which is punished as murder, the benefit of clergy being taken away from it by statute; namely, the offence of mortally stabbing another, though done upon sudden provocation. See STABBING.

MANTA, in ichthyology. See RAJA.

MANTE, a considerable town of France, capital of the Mantois; seated on the river Seine, in E. Long. 1. 45. N. Lat. 48. 58.

MANTELETS, in the art of war, a kind of moveable parapets, made of planks about three inches thick, nailed one over another, to the height of almost six feet, generally cased with tin, and set upon little wheels, so that in a siege they may be driven before the pioneers, and serve as a blinds to shelter them from the enemy's small shot.

MANTINEA, (anc. geog.) a town situate in the fouth of Arcadia, on the confines of Laconia, (Ptolemy); called afterwards *Antigonea*, in honour of king Antigonus. It is memorable for a battle fought in its neighbourhood between the Thebans and Spartans, in which fell the celebrated commander Epaminondas. See THEBES.

MANTIS, in zoology, a genus of insects belonging to the order of hemiptera, the characters of which are these: The head bending forward, maxillous, and furnished with palpi: four membranaceous convoluted wings, the two lowermost plicated: the fore-feet compressed, ferrato-denticulated underneath; armed with a single claw, and a setaceous, lateral-jointed toe: the thorax linear, long, and narrow. There are 14 species, of which the most remarkable is the cicifolia, or walking-leaf, said to be brought from the Spanish West Indies: it is very flat-bodied; of the reddish colour of some dried leaves; the wings being a little more yellow, some of them inclining to green. Mr Edwards is of opinion, that they change from green to a reddish brown, according as the leaves of the trees change with the season of the year, in order the better to deceive birds that may feed on them. The hinder legs are perfect; but our author believes the outer joints of the four other legs broke off, and he did not care to supply them by conjecture. See Plate CLXVI. fig. 1.

MANTLE, or MANTLE-Tree, in architecture, the lower part of the chimney, or that piece of timber which is laid across the jaumbs, and sustains the compartments of the chimney-piece.

MANTLE, or Mantling, in heraldry, that appearance of folding of cloth, flourishing, or drapery, which in any achievement is drawn about a coat of arms. See HERALDRY, p. 3607.

MANITO, in poetic history, the daughter of Tiresias, and like her father strongly inspired with prophecy. She was in so great esteem, that, when the Argives pillaged Thebes, they thought they could not acquit

acquit their vow to Apollo, of consecrating to him the most precious thing in their plunder, without offering him this young woman. She was therefore sent to the temple of Delphi. But this did not engage her in any vow of continency; or, if it did, she observed it very ill. For she bore a son, called *Amphilochus*, to Alcmæon, who had been generalissimo of the army which took Thebes; and a daughter to the same, named *Tiphphone*. These children were the fruits of an amour carried on during the madness which had seized Alcmæon, after he had put his mother to death. Virgil transports her into Italy, not for the sake of securing her virginity, but to produce a son of her who built Mantua.

MANTUA, anciently a town of the Transpadana, in Italy, situated on the Mincius, a river running from the Lacus Benacus, (Piny); a very old town, supposed to be older than Rome. It is still called *Mantua*, and is the capital of the duchy of that name. It is now a large place, having eight gates and about 16,000 inhabitants. The streets are broad and straight, and the houses well built. It is very strong by situation as well as by art; lying in the middle of a lake, or rather morass, formed by the river Minchio. There is no access to the city but by two causeways which cross these morasses, and which are strongly fortified; so that the city is looked upon to be one of the most considerable fortresses of Europe; and the allies in 1745, tho' their army was in the duchy, durst not undertake the siege. It was greatly noted for its silk-manufactures, which are now much decayed. The air in the summer-time is very unwholesome. The celebrated poet Virgil was born at a village near this city. E. Long. 10. 47. N. Lat. 45. 10.

MANTUA, the duchy of, a country of Italy, lying along the river Po, which divides it into two parts. It is bounded on the north by the Veronese; on the south, by the duchies of Reggio, Modena, and Mirandola; on the east, by the Ferrarese; and on the west, by the Cremonese. It is about 50 miles in length, and 25 in breadth; is fruitful in corn, pastures, flax, fruits, and excellent wine. Charles IV. the last duke of Mantua, being a vassal of the empire, took part with the French, in the dispute relating to the succession of Spain; for which reason he was put under the ban of the empire, and died at Venice in 1708. He having no heirs, the emperor kept the Mantuan in his own hands, and the duke of Savoy had Montserrat, which were confirmed to them by subsequent treaties. After the death of the emperor, in 1740, his eldest daughter, now empress-queen, kept possession of the Mantuan; and the governor of the Milanese had the administration of affairs. The Mantuan comprehends the duchies of Mantua, Guastalla, and Sabioneta; the principalities of Castiglione, Solferino, and Bosolo; likewise the county of Novellara. The principal rivers are the Po, the Oglio, and the Minchio; and the principal town is Mantua.

MANTUAN (Baptist), a famous Italian poet, born at Mantua in 1448. He took his name from the town; not having a right to that of his father, as being a natural son. In his youth, he applied himself to Latin poetry, which he cultivated all his life; for it does not appear that he wrote any thing in Italian. He entered among the Carmelites, and became gene-

ral of the order; tho' he quitted that dignity upon some disgust in 1515, and died the year following. The duke of Mantua, some years after, erected a marble statue to his memory crowned with laurel, and placed it next to Virgil. His works were collected and published at Paris in three volumes folio in 1515, with the commentaries of St Morrhon, S. Brant, and I. Badius.

MANUAL, a word signifying any thing performed by the hand.

MANUAL (*manualis*), in law, signifies what is employed or used by the hand, and whereof a present profit may be made: as such a thing in the manual occupation of one is where it is actually used or employed by him.

MANUAL *Exercise*, in the army, consists in the observance of certain words of command appointed for this purpose. When a regiment is drawn up, or paraded for exercise, the men are placed three deep, either by companies, or divided into platoons, with the grenadiers on the right. When soldiers are drawn up for exercise, the ranks and files should be exactly even; and each soldier should be instructed to carry his arms well, to keep his firelock steady and even upon his shoulder, with the right hand hanging down, and the whole body without constraint. The distances between the files must be equal, and the ranks eight feet distant from each other. Every motion should be performed with life, and the greatest exactness observed in all firings, wheelings, and marching; and therefore a regiment should never be under arms longer than two hours.

The following is an abstract of the words of command at the manual exercise, with their explanations.

- 1. Pose your firelock:* i. e. Seize the firelock with your right hand, and turn the lock outwards, keeping the firelock perpendicular; then bring up the firelock with a quick motion from the shoulder, and seize it with the left hand, just above the lock, so that the fingers may lie upon the stock, with the elbows down, and the thumb upon the stock; the firelock must not be held too far from the body, and the left-hand must be of an equal height with the eyes.
- 2. Cock your firelock:* i. e. Turn the barrel opposite to your face, and place your thumb upon the cock, raising your elbow square at this motion; then cock your firelock, by drawing your elbow down, placing your right thumb on the breech-pin, and the fingers under the guard.
- 3. Present:* i. e. Step back about six inches to the rear with the right-foot, bringing the left-toe to the front; at the same time the butt-end of the firelock must be brought to an equal height with the shoulder, placing the left-hand on the swell, and the fore-finger of the right-hand before the trigger, sinking the muzzle a little.
- 4. Fire:* i. e. Pull the trigger briskly, and immediately after, bringing up the right-foot to the inside of the left, come to the priming position, with the lock opposite to the right-breech, the muzzle to the height of the hat, keeping it firm and steady; and at the same time seize the cock with the fore-finger and thumb of the right-hand, the back of the hand being turned up.
- 5. Half-cock your firelock:* i. e. Half bend the cock briskly with a draw-back of the right-elbow, bringing it close to the butt of the fire-lock.
- 6. Handle your cartridge:* i. e. Bring your right-

right-hand with a short round to your pouch, slipping it hard; seize the cartridge, and bring it with a quick motion to your mouth; bite the top well off, and bring the hand as low as the chin, with the elbow down. 7. *Prime*: i. e. Shake the powder into the pan, placing the three last fingers behind the rammer, with the elbow up. 8. *Shut your pans*: i. e. Shut your pans briskly, drawing your right-arm at this motion towards your body, holding the cartridge fast in your hand, as before; then turn the piece nimble round to the loading position, with the lock to the front, and the muzzle to the height of the chin, bringing the right-hand behind the muzzle, with both feet kept fast in this motion. 9. *Charge with cartridge*: i. e. Turn up your hand, and put the cartridge into the muzzle, shaking the powder into the barrel; place your hand, closed, with a quick and strong motion, upon the rammer. 10. *Draw your rammer*: i. e. Draw the rammer with a quick motion half out, seizing it at the muzzle back-handed; draw it quite out, turn it, and enter it into the muzzle. 11. *Ram down your charge*: i. e. Ram the cartridge well down in the barrel, instantly recovering and seizing the rammer back-handed at the centre, turning it, and entering it as far as the lower pipe, placing at the same time the edge of the hand on the butt-end of the rammer, with fingers extended. 12. *Return your rammer*: i. e. Return the rammer, bringing up the piece with the left-hand to the shoulder, seizing it with the right-hand under the cock, keeping the left-hand fast at the swell, turning the body square to the front. 13. *Shoulder your firelock*: i. e. Quit the left-hand, and place it strong upon the butt; quit the right-hand, and throw it down the right-side. 14. *Rest your firelock*: i. e. Seize the firelock with the right-hand, turning the lock outwards; raise the firelock from the shoulder, and place your left-hand with a quick motion above the lock, holding the piece right up and down in both hands before you, and your left-hand even with your eyes; step briskly back with your right-foot, placing it a hand's-breadth distance from your left-heel, and at the same time bring down your firelock as quick as possible to the rest, sinking it as far down before your left-hand as your right-hand will permit without constraint; your left-hand being at the feather-spring, and your right, with fingers extended, held under the guard, taking care to draw in the muzzle well towards your body, and to dress in a line with the butt-end. 15. *Order your firelock*: i. e. Place your firelock nimbly with your left-hand against your right-shoulder; quit the firelock with the right-hand, sinking it at the same time with your left; seize it at the muzzle, which must be of an equal height with your chin, and hold it close against your right-side; lift up your right-foot, and place it by your left; at the same time throw back your left-hand by your left-side, and with your right bring down the butt-end strong upon the ground, placing it even with the toe of your right-foot; the thumb of your right-hand lying along the barrel, and the muzzle kept at a little distance from your body. 16. *Ground your firelock*: i. e. Half-face to the right upon your heels, and at the same time turn the firelock, so that the lock may point to the rear, and the flat of the butt-end lie against the inside of your foot; at the same time slipping the right-foot behind the

butt of the firelock, the right-toe pointing to the right, and the left to the front: step directly forward with your left-foot, about as far as the swell of the firelock, and lay it upon the ground, your left hand hanging down by your left-leg, and your right kept fast, with the butt-end against it; raise yourself up again nimbly, bringing back your left-foot to its former position, keeping your body faced to the right; face again to the left upon your heels, and come to your proper front, letting your hands hang down without motion. 17. *Take up your firelock*: i. e. Face to the right upon both heels; sink your body down, and come up to the position described in the second motion of grounding; raise yourself and firelock, bringing it close to your right-side; come to your proper front, seizing your firelock at the muzzle, as in explanation 15. 18. *Rest your firelock*: i. e. Bring your right-hand as far as the swell; raise the firelock high up in a perpendicular line from the ground with your right-hand, and seize it with your left above the spring, the cock being at the height of the waist belt; step back with your right-foot, placing it behind your left-heel, and come to the rest. 19. *Shoulder your firelock*: i. e. Lift up your right foot, and place it by your left; bring the firelock at the same time to your left-shoulder, and seize the butt-end with the left-hand, keeping it in the same position as above described; throw your right-hand briskly back. 20. *Secure your firelock*: i. e. Bring the right-hand briskly up, and place it under the cock, keeping the firelock steady in the same position; quit the butt with the left-hand, and seize the firelock with it at the swell, bringing the elbow close down upon the lock; the right-hand being kept fast in this motion, and the piece still upright; quit the right-hand, and bring it down your right-side, bringing the firelock nimbly down to the secure; the left-hand in a line with the waist-belt. 21. *Shoulder your firelock*: i. e. Bring the firelock up to a perpendicular line, seizing it with the right hand under the cock; quit the left-hand, and place it strong upon the butt; quit the right-hand, and bring it smartly down the right-side. 22. *Fix your bayonet*: i. e. First and second motions, as in the two first of the secure; quit the right-hand, and bring the firelock smartly down to the left-side with the left-hand, as far as it will admit without constraint, seizing the bayonet at the same time with the right-hand, and fixing it, placing that hand just below the brafs, with the piece kept close to the hollow of the shoulder. 23. *Shoulder your firelock*: i. e. Quit the right-hand, and bring up the firelock with the left; seize it again under the cock with your right, as in the second motion of the secure; quit the left hand, and place it strong upon the butt; quit the right-hand, and bring it down the right-side. 24. *Present your arms*: i. e. as explained in three motions of the 14th word of command. 25. *To the right face*: i. e. Bring up the firelock with a quick motion high before you, till your left-hand comes even with your eyes, with the fingers of that hand extended along the stock, just above the feather spring, the right-foot to be brought close up to the left-heel in this motion; face to the right, taking care in facing to hold the firelock right up and down, and steady in your hands; step back with your right-foot, and come down to your present, as in the foregoing explanation. 26. *To the right face*.

face; i. e. as in the foregoing explanation, facing to the right. 27. *To the right-about face*; i. e. as in the 25th explanation, only coming to the right-about instead of to the right. 28. *To the left face*: i. e. Bring the right-foot briskly to the hollow of your left, with the firelock in the same position as in the first motion of *facing to the right*; face to the left; come down to the *present*, as before. 29. *To the left face*; i. e. as in the foregoing explanation. 30. *To the left-about face*; i. e. as before, coming to the left-about instead of to the left. 31. *Shoulder your firelock*; i. e. as in the two motions of the 19th explanation. 32. *Charge your bayonet*; i. e. as in the first explanation: bring the swell of the firelock down strong upon the palm of the hand, grasping the piece at the small, behind the lock, and as high as the waist-belt; the firelock upon a level with the barrel upwards. 33. *Shoulder your firelock*: i. e. Bring up the firelock to the shoulder, place the left-hand upon the butt, bringing the feet square to the front; quit the right-hand, and throw it down the right side. 34. *Advance your arms*; i. e. first and second motions, as in the first explanation: bring the firelock down the right-side, with the right-hand as low as it will admit without constraint, slipping up the left-hand at the same time to the swell, the guard between the thumb and fore finger of the right-hand, the three last fingers under the cock, with the barrel to the rear; quit the left-hand. 35. *Shoulder your firelock*; i. e. bring up the left-hand, and seize it at the swell; come smartly up to the poise; shoulder. 36. *Prime and load*: i. e. Come smartly to the *recover*, by springing the firelock straight up with the left-hand, turning the barrel inwards to the proper height of the *recover*: at the same time that the left-hand springs the firelock, the right-hand is raised briskly from the right-side, and seizes the firelock across the breast: as it rises below the cock, the left-hand comes with a quick motion from the butt, and seizes the firelock strong above the lock, the little finger of the left-hand at the spring of the lock, the left-hand at an equal height with the face, the butt close to the body, but not pressed, the firelock perpendicular opposite the left-side of the face: bring the firelock down with a brisk motion to the priming position, the left-hand holding the firelock, as in priming; the thumb of the right-hand placed against the face of the steel, the fingers clinched, and the elbow a little turned out, that the wrist may be clear of the cock: open the pan, by throwing up the steel with a strong motion of the right arm, turning the elbow in, and keeping the firelock steady in the left-hand: handle your cartridge; prime; shut your pan; cast about; load; draw rammers; ram down the cartridge; return the rammers; shoulder. N. B. The motion of *recover*, and coming down to the priming position and opening pans, are to be done in the usual time. The motions of handling cartridge to shutting the pans, are to be done as quick as possible: when the pans are shut, a small pause is to be made, and then cast about together; then the loading motions are to be done as quick as possible; but before the rammer is returned, another small pause is to be made, counting 1, 2, between each motion, till the firelock is shouldered.—*Front rank, make ready*: i. e. Spring the firelock briskly to the *recover*, keeping the left-foot fast in this motion; as

soon as the firelock is at the *recover*, without any stop, sink the body briskly without slooping forward, with a quick motion down upon the right knee; the butt-end of the firelock at the same time falls upon the ground, the front part of the butt being in a line with the heel of the left-foot. As soon as the butt comes to the ground, the firelock is to be cocked, immediately seizing the cock and steel in the right-hand; the firelock to be held firm in the left-hand, about the middle of that part of the firelock between the lock and the swell of the stock; the point of the left-thumb to be close to the swell, pointing upwards. As the body is sinking, the right-knee is to be thrown as far back as the left-leg may be right up and down; the right foot to be thrown a little to the right; the body to be kept straight; the head up, looking to the right along the rank, the same as if shouldered; the firelock to be upright, and the butt about four inches to the right of the inside of the left-foot. *Present*: i. e. Bring the firelock briskly down to the *present*, by extending the left-arm to the full length with a strong motion; at the same time spring up the butt by the cock with the right-hand, and raise up the butt so high upon the right-shoulder, that you may not be obliged to stoop too much with the head; the right-check to be close to the butt, and the left-eye shut, and look along the barrel with the right-eye from the breech-pin to the muzzle; keep the left-elbow down in an easy position, and stand as steady as possible; the thumb of the right-hand to remain in the position as described in the third explanation of the manual. *Fire*: i. e. Pull the trigger as directed in the manual; and as soon as the piece is fired, give yourself a strong spring upon your left-leg, raising your body briskly, and straight up, keeping your left foot fast, and bringing the right-heel to the inside of the left; at the same time the firelock is to be brought up to the priming position, and half-cocked immediately: a short pause is to be made; then handle cartridge, and go on with the loading motions described in the explanation of *prime and load*.—*Centre rank, make ready*: i. e. Spring the firelock briskly to the *recover*; so soon as the left-hand seizes the firelock above the lock, the right-elbow is to be nimbly raised a little, placing the thumb of that hand upon the cock; the fingers open by the plate of the lock, and as quick as possible force the piece to the cock, by dropping the elbow, and forcing down the cock with the thumb, stepping at the same time a moderate pace to the right, keeping the left foot fast; as the firelock is cocked, the thumb is to fall below the cock, the right-hand seizing the firelock close under the cock, firmly, the fore-finger not to be before the trigger; the piece to be held in this position perpendicular, opposite the left-side of the face, the butt close to the left-breast, but not pressed; the body to be straight, and as full to the front as possible; the head kept up, looking to the right of the rank, that the body and the firelock may not stoop forward, nor lean much out of the rank. *Present*: i. e. Spring the firelock from the body to the arm's length with a quick motion, pressing down the muzzle with the left-hand, and spring up the butt with the right-hand, as in the foregoing explanation of the *front-rank*. *Fire*. As in explanation 4, in the manual, with this difference, that the left-foot is to be brought up to the right, at the same time that the firelock is brought

brought

Manotius.

brought down to the priming position. The loading motions as in the explanations of priming and loading; and at the last motion of shouldering, to spring to the left again, and cover the file-leaders.—*Rear rank make ready*: i. e. Recover the firelock, and cock as before directed for the centre rank; as the firelock is recovered and cocked, step briskly straight to the right, with the right-foot, a full pace; bring the left-heel about six inches before the right-foot; the body straight, and as square to the front as possible, as in the explanation of the centre rank. *Present*: As in explanation *present*, before. *Fire*: As in explanation of the centre rank; and as the firelock is coming down to the priming position, the left is to be brought back to the right; and at the last motion of shouldering, to spring to the left again, and cover the file-leader.

There are some peculiar words of command at the manual exercise of the grenadiers, when apart from the battalion; and also for the cavalry and artillery.

MANUFACTURE, a commodity produced by the work of the hand, as cloth, &c.

MANUFACTURER, one who works up a natural product into an artificial commodity.

MANURE, any thing used for fattening and improving land. See AGRICULTURE, Sect. I. II. and III.

MANUSCRIPT, in matters of literature, denotes a written book, in contradistinction to a printed book. See Book.

MANUTIUS (Aldus), the first of those celebrated Venetian printers, who were as illustrious for their learning, as for uncommon skill in their profession. He was born at Bassano in Italy, about the middle of the 15th century; and hence is sometimes called *Bassianus*, though generally better known by the name of *Aldus*. He was the first who printed Greek neatly and correctly; and acquired so much reputation by it, that whatever was finely printed, was proverbially said to have "come from the press of Aldus." We have a kind of Greek grammar of his, with notes upon Homer, Horace, &c.

MANUTIUS (Paulus), son of the former, was born at Venice in 1512. He was more learned than his father; and he acquired, by continual reading of Tully, such a purity in writing Latin, that even Scaliger allows, a Roman could not exceed. Pope Pius IV. placed him at the head of the apostolical press, and gave him the charge of the Vatican library. His Epistles are infinitely laboured, and very correct; but, as may be said of most of the Ciceronians, they contain scarcely any thing but mere words. This constant reading of Tully, however, together with his profound knowledge of antiquity, qualified him extremely well for an editor of Tully; whose works he accordingly published, with Commentaries on them, in 4 vols folio, at Venice in 1523. He died in 1574.

MANUTIUS (Aldus), the Younger, the son of Paulus, and the grandson of Aldus Manutius, was esteemed one of the greatest geniuses and most learned men of his time. Clement VIII. gave him the direction of the Vatican printing-house; but probably the profits of that place were very small, since Manutius was obliged for his subsistence, to accept of a professor of rhetoric's chair, and to sell the excellent library that was in his family, which his father, his uncle, and his great-

uncle, had collected with extraordinary care, and which it is said contained 80,000 volumes. He died at Rome in 1597, without any other recompense than the praises due to his merit. He wrote, 1. Commentaries on Cicero. 2. A treatise on orthography. 3. Three books of epistles; and other works in Latin and Italian, which are esteemed.

MAON, (anc. geog.), a town of the tribe of Judah, to the south-east, towards the Dead Sea. It gave name to the *wilderness of Maon*, 1 Sam. xxiii.

MAP, a plain figure, representing the surface of the earth, or a part thereof, according to the laws of perspective. See GEOGRAPHY, n° 13—23.

MAPLE. See ACER.

MAPLETOFT (Dr John), descended from a good family in Huntingdonshire, was born in 1631. He was educated in Trinity-college, Cambridge, and qualified himself for the profession of physic; and in 1675 was chosen professor of that art at Gresham college. He translated Dr Sydenham's *Observationes Medicæ circa morborum acutorum historiam et curationem* into the Latin, and Sydenham dedicated them to Mapletoft. He married in 1679, and soon after transferred his studies from physic to divinity; took orders; obtained the vicarage of St Lawrence Jewry, with the lectureship of St Christopher's in London; and having been a benefactor to Sion college, was, in 1707, elected president. He continued to preach in his church of St Lawrence Jewry till he was above 80 years of age; and in his decline printed a book intitled *The principles and duties of the Christian religion*, &c. 8vo. 1710. a copy of which he sent to every house in his parish. He was a polite scholar; and beside some other pieces on moral and theological subjects, there are in the Appendix to Ward's Lives of the professors of Gresham-college, three Latin lectures read there by him, on the origin of the art of Medicine, and the history of its invention.

MAPPARIUS, in Roman antiquity, the officer who gave the signal to the gladiators to begin fighting; which he did by throwing an handkerchief that he had received from the emperor or other magistrate.

MARACANDA (anc. geog.), capital of the Sogdiana. Now thought to be *Samarcand*, a city of Usbec Tartary in Asia, the country and royal residence of Tamerlane. See SAMARCAND.

MARACAYBO, a rich and considerable town of South America, and capital of the province of Venezuela, seated near a lake of the same name. It carries on a great trade in skins and chocolate, which is the best in America; and they have likewise very fine tobacco. It was taken by the French bucaniers in 1666 and 1678. W. Long. 70. 45. N. Lat. 10. 0.

MARACAYBO, a lake in South America, 200 miles long and 100 broad, which discharges itself by a river into the North Sea. It is well defended by strong forts; which, however, did not hinder Sir Henry Morgan, a bucanier, from entering it, and plundering several Spanish towns on the coast, after defeating a squadron sent out against him.

MARAGNÂN, a province of Brazil in South America, which comprehends a fertile populous island, 112 miles in circumference. The French settled here in 1612, and built a town; but they were soon driven

Maon  
|  
Maragnan.

Maraldi  
||  
Maranta.

from thence by the Portuguese, who have possessed it ever since. The town is little, but strong; and has a castle, a harbour, and a bishop's see. The climate is very agreeable and wholesome, and the soil produces plenty of all the necessaries of life. W. Long. 54. 35. S. Lat. 2. 0.

MARALDI (James Philip), a learned mathematician and astronomer, of the academy of sciences at Paris, was born in 1665. He was the son of Francis Maraldi and Angela Catharine Caffini, the sister of the famous astronomer of that name. His uncle made him go to France in 1687, where he acquired great reputation on account of his learning and observations. He made a catalogue of the fixed stars, which is more particular and exact than Bayer's; and has given a great number of curious and interesting observations in the memoirs of the academy; in particular, those on bees and petrifications have been universally applauded. He died in 1729.

MARANA (John Paul), an ingenious writer of the 17th century, was of a distinguished family, and born at Genoa; where he received an education suitable to his birth, and made a great progress in the study of polite literature and the sciences. Having been engaged in the conspiracy of Raphael della Terra, to deliver up Genoa to the duke of Savoy, he was in 1670, when 28 years of age, imprisoned in the tower of that city, and remained there four years. Being at length set at liberty, he was ordered to write the history of that conspiracy; but, when finished, it was seized, and prevented from being published. When the republic of Genoa was at variance with the court of France, Marana, who had always an inclination for that court, was afraid of being imprisoned a second time; and retired to Monaco, where he again wrote the history of the conspiracy in Italian; and, in 1682, went to Lyons to get it printed. From Lyons he went to Paris, where his merit soon acquired him powerful protectors. He spent the rest of his life in a happy and tranquil mediocrity, devoted to study and the society of men of learning; and died in 1693. His history of the conspiracy contains many curious and interesting anecdotes, which are nowhere else to be found. He also wrote several other works; the most known of which is the Turkish Spy, in 6 vols 12mo, which was in 1742 augmented to seven. Of this ingenious work we have an excellent English translation.

MARANO, a town of Italy, in the territory of Venice and province of Friuli, with a strong citadel; seated in a marsh at the bottom of the Gölph of Venice, which renders it difficult of access.

MARANS, a rich town of France, in the territory of Aunis and diocese of Rochelle, seated among salt marshes, near the river Sevre, three miles from the sea. It carries on a very great trade in corn; and is seated in W. Long. 0. 55. N. Lat. 46. 20.

MARANTA, INDIAN ARROW-ROOT; a genus of the monogynia order, belonging to the monandria class of plants. There are two species, the arundinacea and galanica, both of them herbaceous perennial exotics of the Indies, kept here in hot-houses for curiosity: they have thick, knotty, creeping roots, crowned with long, broad, arundinaceous leaves, ending in points, and upright stalks, half a yard high, terminated by bunches of monopetalous, ringent, five-parted flowers.

They are propagated by parting the roots in spring, and planting them in pots of light rich earth, and then plunging them in the bark-bed. The root of the galanga is used by the Indians to extract the *virius* communicated by their poisoned arrows; from whence it has derived its name of *arrow root*.

MARASMUS, among physicians, denotes an atrophy or consumption in its last and most deplorable stage.

MARATHON, (anc. geog.), one of the demi or hamlets of Attica; about 10 miles to the north-east of Athens, towards Boeotia, near the sea; famous for the victory of the Athenians over the Persians under Miltiades; and for the Marathonian bull slain by Theseus, (Plutarch, Ovid). Near Marathon is a bog, into which the Persians plunging in their flight stuck fast, and were slain by the conquerors.

MARATTI (Carlo), a celebrated painter, was born at Camorano, near Ancona, in 1625. He came a poor boy to Rome, when only 11 years old; and at 12 recommended himself so effectually to Andrea Sacelli, by his drawings after Raphael in the Vatican, that he took him into his school, where he continued 25 years till his master's death. His graceful and beautiful ideas occasioned his being generally employed in painting madonas and female saints. No man ever performed in a better style, or with a greater elegance. From the finest statues and pictures, he made himself master of the most perfect forms, and the most charming airs of heads, which he sketched with equal ease and grace. He has produced a noble variety of draperies, more artfully managed, more richly ornamented, and with greater propriety than even the best of the moderns. He was inimitable in adorning the head, in the disposal of the hair, and the elegance of his hands and feet, which are equal to those of Raphael; and he particularly excelled in graces. In his younger days he etched a few prints, as well of his own invention as after others, with equal spirit and correctness. It would be endless to recount the celebrated paintings done by this great man. Yet he executed nothing slightly, often changed his design, and almost always for the better, whence his pictures were long in hand. By the example of his master, he made several admirable portraits of popes, cardinals, and other people of distinction, from whom he received the highest testimonials of esteem, as he likewise did from almost all the monarchs and princes of Europe. Innocent XI. appointed him keeper of the paintings in his chapel and the Vatican. Maratti erected two noble monuments for Raphael and Hannibal, at his own expence, in the Pantheon. How well he maintained the dignity of his profession, appears by his answer to a Roman prince, who complaining of the excessive price of his pictures, he told him there was a vast debt due from the world to the famous artists his predecessors, and that he, as their rightful successor, was come to claim those arrears. His abilities in painting were accompanied with many virtues, and particularly with an extensive charity. This great painter died at Rome in 1713, in the 88th year of his age.

MARAUDING, in a military sense, means a party of soldiers, who, without any order, go into the neighbouring houses and villages, when the army is either in camp or garrison, to plunder and destroy, &c. Marauders are a disgrace to the camp, to the military profession,

Marasmus  
||  
Marauding.

feffion, and deferve no better quarter from their officers than they give to poor peafants, &c.

MARBLE, in natural hiftory, a genus of foffils; being bright and beautiful ftones compofed of fmall feperate concretions, moderately hard, not giving fire with fteel, fermenting with and foluble in acid menftrua, and calcining in a flight fire.—The word comes from the French *marbre*, and that from the Latin *marmor*, or the Greek *μαρμαριον*, to “fhine or glitter.”

The colours of marbles being a very obvious and ftriking character, they are arranged according to them in the following divifions. 1. Of the white plain marbles there are two forts; the Parian marble of the ancients, and ftatuary marble of the moderns, an extremely bright and elegant marble; and the Carara marble, a very fine marble, more compact and clofe than the former, but lefs bright. 2. Of the plain yellowifh marbles there is only one fort, which is a hard, pale yellow, and gloffy marble, found in many parts of Italy. 3. Of the bluish and black marbles there are a great many fpecies, as the China marble, bafaltic, &c. 4. Of the plain green marbles there is only one kind, the Lacedaemonian marble of the ancients. 5. The pale coloured or whitifh brown, commonly called *Darby marble*. 6. The green marbles with fhells. 7. The black caralloide marble, with and without fhells. 8. Of the white variegated marbles there are a great many fpecies, variegated with purple, brown, red, blue, &c. 9. Of the brown variegated marbles there are likewife feveral forts, fome with red veins, others with white, black, or brown veins. 10. Of the yellow-veined and variegated marbles, fome are veined with purple, and others with blue. 11. Of the black variegated marbles, fome are veined with white, and others with blue, yellow, red, &c. 12. The green variegated marbles are likewife diftinguifhed by the colour of their veins. 13. The gray spotted marbles are variegated, fome with black, and others with green fpoats. 14. The red variegated marble is the brocatello of the Italians, with white and gold veins.

Marble, when chemically examined, appears to confift of calcareous earth united with much fixed air; and is, like limftone or chalk, capable of being converted into a ftrong quicklime.—Dr Black derives the origin of marbles, as well as limftone and marle, from the fame fource, viz. from the calcareous matter of fhells and lithophyta. In one kind of limftone known by the name of *Portland ftone*, and confifting of round grains united together, it was fuppofed to be compofed of the fpawn of fifh; but comparifons of other phenomena have explained it. It is plain that it has been produced from a calcareous fand, which is found on the fhore of fome of the iflands in the fouthern climates. By the conflant agitation the fofter parts are wore off, and the harder parts remain in the form of particles that are highly polifhed, and which are afterwards gradually made to concrete together by caufes of which we have yet no knowledge.—There are indeed fome few of the limftones and marbles in which we cannot difcover any of the relics of the fhells; but there are many figns of their having been in a diffolved or liquified ftate; fo we cannot expect to fee the remains of the form of the fhells: but even in many of the marbles that have the greateft appearance of a complete mixture, we ftill find often the confufed remains of the

fhells of which they have been originally compofed. We fhould ftill find it difficult to conceive how fuch mafles fhould have derived their origin from fhells; but, confidering the many collections that we have an opportunity of feeing in their fteps towards this procefs, and a little concreted together, fo that by their going a ftep further they might form limftone and marbles, we fhall foon fee the poffibility of their being all produced in the fame manner. Thus vaft quantities of fhells have been found in the province of Turin in France; and indeed there is no place where they have not been found. The lithophyta likewife feem to be a very fruitful fource of this kind of earth. In the cold climates, where the moderate degree of heat is not fo productive of animal-life, we have not fuch an opportunity of obferving this: but in the hot climates, the fea, as well as the fand, fwarms with innumerable animals; and, at the bottom, with thofe that produce the corals and madripores. We learn from the hiftory of a fhip that was funk in a ftorm in the Gulf of Mexico, the vaft growth there is of thefe bodies. About 30 years after, they attempted to dive into it to get out a quantity of filver; but they found great difficulty in getting it, from the fhip being overgrown with coral. Sir Hans Sloan, in the Philofophical Tranfactions, and in his hiftory of Jamaica, obferves, that the fhip's timber, the iron, and money, were all concentered by the growth of the calcareous matter. So in a tract of many thoufands of years the quantity of it fhould be very great; and as this is going on through a very great extent of the bottom of the fea, it will produce very extenfive as well as mafly collections of calcareous matter.

**Colouring MARBLE.** This is a nice art; and, in order to fucceed in it, the pieces of marble on which the experiments are tried, muft be well polifhed, and free from the leaft fpot or vein. The harder the marble is, the better will it bear the heat neceffary in the operation; therefore alabafter and the common foft white marble are very improper for performing thefe operations upon.

Heat is always neceffary for opening the pores of marble, fo as to render it fit to receive the colours: but the marble muft never be made red-hot; for then the texture of it is injured, and the colours are burnt, and lofe their beauty. Too fmall a degree of heat is as bad as one too great; for, in this cafe, though the marble receives the colour, it will not be fixed in it, nor ftrike deep enough. Some colours will ftrike even cold; but they are never fo well funk in as when a juft degree of heat is ufed. The proper degree is that which, without making the marble red, will make the liquor boil upon its furface. The menftrums ufed to ftrike in the colours muft be varied according to the nature of the colour to be ufed. A lixivium made with horfe's or dog's urine, with four parts of quicklime, and one of pot-afhes, is excellent for fome colours; common ley of wood-afhes is very good for others; for fome, fpirit of wine is beft; and laftly, for others, oily liquors, or common white-wine.

The colours which have been found to fucceed beft with the peculiar menftrums, are thefe. Stone-blue diffolved in fix times the quantity of fpirit of wine, or of the urinous lixivium, and that colour which the painters call *litmus*, diffolved in common ley of wood-afhes.

Marble.

ashes. An extract of saffron, and that colour made of backhorn berries, and called by painters *sap-green*, both succeed well when dissolved in urine and quicklime; and tolerably well when dissolved in spirit of wine. Vermilion, and a very fine powder of cochineal, also succeed very well in the same liquors. Dragon's-blood succeeds in spirit of wine, as does also a tincture of logwood in the same spirit. Alkanet-root gives a fine colour: but the only menstruum to be used for it is oil of turpentine; for neither spirit of wine, nor any lixivium, will do with it. There is another kind of *sanguis draconis*, commonly called *dragon's-blood in tears*, which, mixed with urine, gives a very elegant colour.

Besides these mixtures of colours and menstruums, there are other colours which must be laid on dry and unmixed. These are, Dragons-blood of the purest kind, for a red; gamboge, for a yellow; green wax, for a green; common brimstone, pitch, and turpentine, for a brown colour. The marble for these experiments must be made considerably hot, and then the colours are to be rubbed on dry in the lump. Some of these colours, when once given, remain immutable, others are easily changed or destroyed. Thus, the red colour given by dragon's-blood, or by a decoction of logwood, will be wholly taken away by oil of tartar, and the polish of the marble not hurt by it.

A fine gold colour is given in the following manner: Take crude sal ammoniac, vitriol, and verdigrise, of each equal quantities. White vitriol succeeds best; and all must be thoroughly mixed in fine powder.

The staining of marble to all the degrees of red or yellow, by solutions of dragon's-blood or gamboge, may be done by reducing these gums to powder, and grinding them with the spirit of wine in a glass mortar. But, for smaller attempts, no method is so good as the mixing a little of either of those powders with spirit of wine in a silver spoon, and holding it over burning charcoal. By this means a fine tincture will be extracted: and, with a pencil dipt in this, the finest traces may be made on the marble while cold; which, on the heating of it afterwards, either on sand, or in a baker's oven, will all sink very deep, and remain perfectly distinct on the stone. It is very easy to make the ground-colour of the marble red or yellow by this means, and leave white veins in it. This is to be done by covering the places where the whiteness is to remain with some white paint, or even with two or three doubles only of paper; either of which will prevent the colour from penetrating. All the degrees of red are to be given to marble by this gum alone; a slight tincture of it, without the assistance of heat to the marble, gives only a pale flesh-colour: but the stronger tinctures give it yet deeper; to this the assistance of heat adds greatly; and finally, the addition of a little pitch to the tincture, gives it a tendency to blackness, or any degree of deep red that may be desired.

A blue colour may be given also to marble by dissolving turnsole in lixivium, in lime and urine, or in the volatile spirit of urine; but this has always a tendency to purple, whether made by the one or the other of these ways. A better blue, and used in an easier manner, is furnished by the Canary turnsol, a substance well known among the dyers. This needs

only to be dissolved in water, and drawn on the place with a pencil: it penetrates very deeply into the marble; and the colour may be increased, by drawing the pencil wetted afresh several times over the same lines. This colour is subject to spread and diffuse itself irregularly: but it may be kept in regular bounds, by circumscribing its lines with beds of wax, or any such substance. It is also to be observed, that this colour should always be laid on cold, and no heat given even afterwards to the marble: and one great advantage of this colour is, that it is therefore easily added to marbles already stained with other colours, is a very beautiful tinge, and lasts a long time.—For other methods of staining marble, see CHEMISTRY, n° 197.

*Arundel* MARBLES, ancient marbles with a chronicle of the city of Athens inscribed on them many years before our Saviour's birth; presented to the university of Oxford by Thomas earl of Arundel, whence the name.

MARBLING, the method of preparing and colouring the marbled paper.

There are several kinds of marbled paper; but the principal difference of them lies in the forms in which the colours are laid on the ground: some being disposed in whirls or circumvolutions; some in jagged lengths; and others only in spots of a roundish or oval figure. The general manner of managing each kind is, nevertheless, the same; being the dipping the paper in a solution of gum-tragacanth, or, as it is commonly called, *gum-dragon*; over which the colours, previously prepared with ox-gall and spirit of wine, are first spread.

The peculiar apparatus necessary for this purpose, is a trough for containing the gum-tragacanth and the colours; a comb for disposing them in the figure usually chosen; and a burnishing stone for polishing the paper. The trough may be of any kind of wood; and must be somewhat larger than the sheets of paper, for marbling which it is to be employed: but the sides of it need only rise about two inches above the bottom; for by making it thus shallow, the less quantity of the solution of the gum will serve to fill it. The comb may be also of wood, and five inches in length; but should have brass teeth, which may be about two inches long, and placed at about a quarter of an inch distance from each other. The burnishing stone may be of jasper, or agate; but as those stones are very dear when of sufficient largeness, marble or glass may be used, provided their surface be polished to a great degree of smoothness.

These implements being prepared, the solution of gum-tragacanth must be made, by putting a sufficient proportion of the gum, which should be white and clear from all foulness, into clean water; and letting it remain there a day or two, frequently breaking the lumps and stirring it, till the whole shall appear dissolved, and equally mixed with the water. The consistence of the solution should be nearly that of strong gum-water, used in miniature-painting; and if it appear thicker, water must be added; or if thinner, more of the gum. When the solution is thus brought to a due state, it must be passed through a linen cloth; and being then put into the trough, it will be ready to receive the colours.

Marble,  
Marbling.

Marbling.

The colours employed for red are carmine, lake, rose-pink, and vermillion; but the two last are too hard and glaring, unless they be mixed with rose-pink, or lake, to bring them to a softer cast; and with respect to the carmine and lake, they are too dear for common purposes:—for yellow, Dutch pink and yellow oker may be employed:—for blue, Prussian blue and verditer may be used:—for green, verdigrise, a mixture of Dutch pink and Prussian blue, or verditer, in different proportions:—for orange, the orange-lake, or a mixture of vermillion, or red lead, with Dutch pink:—for purple, rose-pink and Prussian blue.

These several colours should be ground with spirit of wine till they be of a proper fineness; and then, at the time of using them, a little fish-gall, or in default of it the gall of a beaf, should be added, by grinding them over again with it. The proper proportion of the gall must be found by trying them; for there must be just so much as will suffer the spots of colour, when sprinkled on the solution of the gum-tragacanth, to join together, without intermixing or running into each other.

When every thing is thus prepared, the solution of the gum-tragacanth must be poured into the trough; and the colours, being in a separate pot, with a pencil appropriated to each, must be sprinkled on the surface of the solution, by shaking the pencil, charged with its proper colour, over it; and this must be done with the several kinds of colour desired, till the surface be wholly covered.

When the marbling is proposed to be in spots of a simple form, nothing more is necessary: but where the whirls or snail-shell figures are wanted, they must be made by means of a quill; which must be put among the spots to turn them about, till the effect be produced. The jagged lengths must be made by means of the comb above described, which must be passed through the colours from one end of the trough to the other, and will give them that appearance: but if they desired to be pointed both ways, the comb must be again passed through the trough in a contrary direction; or if some of the whirls or snail-shell figures be required to be added, they may be yet made by the means before directed.

The paper should be previously prepared for receiving the colours, by dipping it over-night in water; and laying the sheets on each other with a weight over them. The whole being thus ready, the paper must be held by two corners, and laid in the most gentle and even manner on the solution covered with the colours; and there softly pressed with the hand, that it may bear every-where on the solution. After which it must be raised and taken off with the same care, and then hung to dry across a proper cord, subtended near at hand for that purpose: and in that state it must continue, till it be perfectly dry. It then remains only to give the paper a proper polish: in order to which, it is first rubbed with a little soap; and then must be thoroughly smoothed by the glass polifhers, such as are used for linen, and called the *calender glasses*. After which it should be again rubbed by a burnisher of jasper, or agate; or, in default of them, of glass ground to the highest polish: for on the perfect polish of the paper depends in a great measure its

beauty and value.

Gold or silver powders may be used, where desired, along with the colours; and require only the same treatment as them, except that they must be first tempered with gum-water.

Marbling of books or paper is performed thus: Dissolve four ounces of gum-arabic into two quarts of fair water; then provide several colours mixed with water in pots or shells; and, with pencils peculiar to each colour, sprinkle them by way of intermixture upon the gum-water, which must be put into a trough or some broad-vessel; then with a stick curl them, or draw them out in streaks, to as much variety as may be done. Having done this, hold your book or books close together, and only dip the edges in, on the top of the water and colours, very lightly; which done, take them off, and the plain impression of the colours in mixture will be upon the leaves; doing as well the ends as the front of the book in the like manner.

Marbling a book on the covers is performed by forming clouds with aqua fortis or spirit of vitriol mixed with ink, and afterwards glazing the covers. See the article BOOK-BINDING.

MARCA (Peter de), one of the greatest ornaments of the Gallican church, was born in Bearn, of an ancient family, in 1594. He first studied the law, was made president of the parliament of Bearn, and, going to Paris in 1639, was made a counsellor of state: the good opinion entertained of his knowledge was confirmed by his *Histoire de Bearn*. By the king's order he published a work, *De concordia sacerdotii et imperii, sive de libertatibus ecclesie Gallicae*, in refutation of a book that appeared under the title of *Opusculum Gallus*; and on this account, when on the death of his wife he was nominated bishop of Conferans, the court of Rome refused the bulls in his favour, until by another book he explained away all he had said on behalf of the state, to the limitation of the papal power. He obtained his confirmation, after seven years suspense, in 1648; was translated to the archbishopric of Toulouse in 1652; and was made minister of state in 1658. He died at Paris in 1662, a short time after he had received the bulls as the archbishop of that metropolis. After his death appeared his *Posthumous works*, with prefaces, notes, &c. by M. Baluze. In all he wrote, he shewed great abilities and learning, but is reproached for accommodating them to his views of interest and ambition.

MARCASITE, in mineralogy. This name has long been given indifferently to all sorts of minerals; to ores, pyrites, and to semimetals. Lately, it seems to be confined to pyrites, and Wallerius proposes to confine it to such pyrites as are regularly formed. This seems to be better than to leave it a vague and indeterminate signification, on account of the ambiguity and obscurity which might thereby be introduced. See PYRITES.

MARCELLINUS (Ammianus.) See AMMIANUS. MARCELLUS (Marcus Claudius), a Roman commander, famous for his valour, was five times consul. He was called *The sword of the Romans*, and killed king Britomarus with his own hand. He subdued the Insubrians, and took Milan their capital; as also Syracuse, where he endeavoured to preserve Archimedes.

medes. He fought two days with Hannibal with equal success; but was killed on the third, and his corpse treated with all imaginable respect by the conqueror. See CARTHAGE, ROME, and SICILY.

MARCGRAVE, or MARGRAVE, a kind of dignity in Germany, answering to our marquis. See MARQUIS. The word is derived from the German *Marche*, or *Marcks*, which signifies a frontier; and *Graf*, count, governor; *Margraves* being originally governors of cities lying on the frontiers of a country or state.

MARCH, MARTIUS, the third month of the year, according to the common way of computing. See MONTH, and YEAR.

Among the Romans, March was the first month: and in some ecclesiastical computations; that order is still preserved; as particularly reckoning the number of years from the incarnation of our Saviour; that is, from the 25th of March.

Till the year 1564, the French reckoned the beginning of their year from Easter: so that there were two months of March in one year, one of which they called *March before Easter*, and the other *March after Easter*. When Easter fell within the month of March, the beginning of the month was in one year, and the end in another.

It was Romulus who divided the year into months; to the first of which he gave the name of his supposed father *Mars*. Ovid, however, observes, that the people of Italy had the month of March before Romulus's time; but that they placed it very differently, some making it the third, some the fourth, some the fifth, and others the tenth month of the year.

In this month it was that the Romans sacrificed to Anna Perenna; that they began their comitia; that they adjudged their public farms and leases; that the mistresses served the slaves and servants at table, as the masters did in the Saturnalia; and that the vestals renewed the sacred fire.

The month of March was always under the protection of Minerva, and always consisted of 31 days.—The ancients held it an unhappy month for marriage, as well as the month of May.

MARCH, in the military art, is the moving of a body of men from one place to another. Care must be taken, in marching of troops, that they are not liable to be flanked or intercepted; for of all operations none is more difficult, because they must not only be directed in the objects they have in view, but according to the movements the enemy may have made.

Of all the mechanical parts of war, none is more essential than that of marching. It may be justly called the *key* which leads to all sublime motions and manoeuvres of an army; for they depend entirely on this point. A man can be attacked in four different ways; in the front, on both flanks, and in the rear; but he can defend himself, and annoy the enemy, only when placed with his face towards him. Hence it follows, that the general object of marching is reduced to three points only; to march forwards, and on both sides, because it is impossible to do it for any time backwards, and by that means face the enemy wherever he presents himself. The different steps to be made use of are three; slow, fast, and oblique.

The first is proper in advancing, when at a considerable distance from the enemy, and when the ground is unequal, that the line may not be broke, and a regular fire kept up without intermission. The second is chiefly necessary, when you want to anticipate the enemy in occupying some post, in passing a defile, and, above all, in attacking an intrenchment, to avoid being a long while exposed to the fire of the artillery and small arms, &c. The third step is of infinite consequence, both in the infantry and cavalry: columns may be opened and formed into lines, and, *vice versa*, lines into columns, by this kind of step, in a lesser space, and consequently in less time, than by any other method whatsoever. In coming out of a defile, you may instantly form the line without presenting the flank to the enemy. The line may be formed, though ever so near to the enemy, with safety, because you face him, and can with ease and safety protect and cover the motion of the troops, while they are coming out of the defiles, and forming. The same thing may be equally executed, when a column is to be formed in order to advance or retreat; which is a point of infinite consequence, and should be established as an axiom.

The order of march of the troops must be disposed, that each should arrive at their rendezvous, if possible, on the same day. The quarter-master-general, or his deputy, with an able engineer, should sufficiently reconnoitre the country, to obtain a perfect knowledge of it and the enemy, before he forms his routes.

Before a march, the army generally receives several days bread. The quarter-masters, camp colour-men, and pioneers, parade according to orders, and march immediately after, commanded by the quarter-master-general, or his deputy. They are to clear the roads, level the ways, make preparations for the march of the army, &c. The general, for instance, beats at 2, the assembly at 3, and the army to march in 20 minutes after. Upon beating the general, the village, and general officer's guards, quarter and rear-guards, join their respective corps; and the army pack up their baggage. Upon beating the assembly, the tents are to be struck, and sent with the baggage to the place appointed, &c.

The companies draw up in their several files, and the rolls are called. At the time appointed, the drummers are to beat a march, and fliers play at the head of the line; upon which the companies march out from their several files, form battalions as they advance to the head of the line, and then halt.

The several battalions will be formed into columns by the adjutant-general, and the order of march, &c. be given to the general officers who lead the columns.

The cavalry generally march by regiments or squadrons. The heavy artillery always keeps the great roads, in the centre of the columns, escorted by a strong party of infantry and cavalry. The field-pieces march with the columns.

Each soldier generally marches with 36 rounds of powder and ball, and 2 good flints; one of which is to be fixed in the cock of his firelock. The routes must be formed so that no columns cross one another on the march.

**MARCHANTIA**, in botany, a genus of the order of algae, belonging to the cryptogamia class of plants. There are eight species, of which the most remarkable are, 1. The polymorpha, or great star-handed marchantia, is a native of Britain, growing on the banks of rivulets, on shady moist rocks, the sides of wells, and sometimes bogs. The leaves are about three inches long; from half an inch to an inch broad, lying flat on the ground, and adhering closely to it by numerous downy radicles, which grow out of the middle and base of the leaf on the under side. These leaves are situated on their edges, their upper surface of a dark, shining, green colour, reticulated with numerous, minute, rhomboidal, or lozenge-like scales; variously divided into obtuse lobes, and in the middle by a blackish purple vein; their under side is of a paler green, and their substance coriaceous, and nearly opaque. There are three varieties, from one of which is produced a yellow powder, showing a most curious and wonderful mechanism when examined by the microscope. The leaves have a strong aromatic smell, and acrid taste; and are recommended, in a decoction of skimmed milk, as good in the jaundice and other disorders of the liver. 2. The conica, or conic-mushroom marchantia, with warted leaves, grows on moist shady banks by the sides of rivulets. The leaves are broad, flat, about two inches long, dichotomous, obtusely lobed, and lie upon one another. Their surface is of a pale-green glossy colour, curiously tessellated with rhomboidal and hexagonal tubercles, each having a white vesicle or wart in the centre, with a puncture on its head. The leaves have a peculiar strong fragrant smell, and acrid aromatic taste. They are supposed to possess the same attenuating quality as the first, but in a higher degree. They are also recommended as an antiscorbutic, and for thinning the blood.

**MARCHE**, a province of France, bounded on the north by Berry, on the east by Avergne, on the west by Angoumois, and on the south by Limosin. It is about 55 miles in length, and 25 in breadth, and is pretty fertile in corn and wine.

**MARCHENA**, an handsome, ancient, and considerable town of Spain, in Andalusia, with the title of a duchy, and a suburb as large as the town, situated in the middle of a plain, particularly fertile in olives, tho' very destitute of water. W. Long. 5. 20. N. Lat. 37. 20.

**MARCHERS**, or **LORDS-MARCHERS**, were those noblemen that lived on the marches of Wales or Scotland; who, in times past, according to Camden, had their laws, and *goflatem vite*, &c. like petty kings, which are abolished by the stat. 27 H. 8. c. 26. and 1 Edw. 6. c. 10. In old records the lords marches of Wales were styled *Marchianes de Marchia Wallie*. See 1 & 2 P. & M. c. 15.

**MARCHES**, (*quarchia*.) from the German *march*, i. e. *limes*, or from the French *marque*, viz. *signum*, (being the notorious distinction between two countries or territories), are the limits between England and Wales, or between England and Scotland, which last are divided into west and middle marches, 4 Hen. 5. c. 7. 22 Ed. 4. c. 8. 24 Hen. 8. c. 9. And there was formerly a court called the *court of the marches of Wales*, where pleas of debt or damages, not above

the value of 50 pounds, were tried and determined; and if the council of the marches held plea for debts above that sum, &c. a prohibition might be awarded. Hill. 14. Car. 1. Gro. Car. 384.

**MARCION**, an heresiarch, born at Sinope in Paphlagonia, or Pontus, in the second century. In his younger years he followed the stoic philosophy, and loved solitude and poverty; but being convicted of uncleanness with a virgin, he was expelled the church by his father, who was bishop. Afterwards he came to Rome, where he invented his heresies. His doctrines were, many of them, the same that were afterwards adopted by the Manichæans; as, for instance, that there two coeternal independent principles, one the author of all good, the other the author of all evil. Marcion meeting St Polycarpus in the streets of Rome, asked him, whether he knew him? "Very well, (answered the bishop), I know you to be the devil's eldest son." Tertullian relates, that Marcion, repenting of his errors, would have abjured them publicly, provided he might have been again admitted into the church; which was agreed to, on condition he would bring back all those he had seduced from it: but before he could effect this task, he died.

**MARCIONITES**. See **MARCION**.  
**MARCOMANNI**, an ancient people of Germany, who seem to have taken their name from their situation on the limits or marches, to the east of the Higher Rhine, and the north of the Danube. Cluverius allots to them the duchy of Wurtemberg, a part of the palatinate between the Rhine and the Neckar, the Brisgau, and a part of Suabia, lying between the springs of the Danube and the river Bregentz: they afterwards removed to the country of the Boii, whom they expelled and forced to withdraw more to the east, occupying what is now called *Bohemia*. (Strabo, Velicius.)

**MARCOSIANS**, a set of Christian heretics of the second century, so called from their leader Marcus, who represented the supreme God as consisting not of a Trinity, but a Quaternity; viz. the Ineffable, Silence, the Father, and Truth.

**MARCUS** (Aurelius Antoninus). See **ANTONINUS**.

**MARDIKERS**, or **TOPASSES**, a mixed breed of Dutch, Portuguese, Indians, and other nations, incorporated with the Dutch at Batavia, in the East Indies.

**MARE**, the female of the horse kind. See the article *EQUUS*.

Before a mare is covered, she should be in the house about six weeks, during which time she should be well fed with good hay and oats well sifted; and in order to render her conception the more certain, near a quart of blood may be taken from each side of her neck, about five or six days before covering. Another method to bring a mare in season and make her retain, is to give her, for the space of eight days before you bring her to the horse, about two quarts of hemp-feed in the morning, and as much at night; and if she refuses to eat it, to mingle it with a little bran or oats, or else to let her fast for a while: and if the stallion also eat of it, it will greatly contribute to generation.

Mares go with foal 11 months, and as many days.

Marets.

as they are years old; and therefore the properest time for covering them is in the beginning of June, that they may foal the May following, when there will be plenty of grass, which will afford the mares a great abundance of milk for nourishing their foals. After covering, let her, for three weeks or a month, have the same diet as before, and be kept clean in the stable till the middle of May, with her feet well pared and thin shod: take her in again about the latter end of September, if not before, and keep her to the end of her foaling. If she cannot readily bring forth, hold her nostrils for as to stop her taking wind; and if that will not do, dissolve madder, to the quantity of a walnut, in a pint of ale, and give it her warm. In case she cannot void her secundine, or after-burden, boil two or three handfuls of fennel in running water; then put half a pint of that liquor into as much sack, or, for want thereof, into a pint of ale, with a fourth part of salad-oil, mixed together, and pour it lukewarm into her nostrils, holding them close for some time. Otherwise, give her green wheat, or rye, the last of which is best.

If the mare has but little milk, boil as much as you can get from her, with the leaves of lavender and spike, and bathe the udder with it warm, till the knobs and knots are dissolved. She should now drink only white water, which is bran put into water; give her also sweet mashes: and a month after foaling, let her have a mash with some brimstone or safin in it.

MARETS (Jean de), a Parisian, one of the finest geniuses of the 17th century, became at last a visionary and a fanatic. He was a great favourite of cardinal Richlieu, and possessed an employment of genius under him; for he was called upon to relax and divert him, after the fatigue of business, by facetious conversation. He used, in order to triumph over the virtue of women, when they objected to him the interest of their salvation, to lead them into atheistical principles. He was a member of the French academy from its first erection. He wrote several dramatic pieces, which were well received. He attempted an epic poem; but after spending several years about it, dropped the design, to write books of devotion. He likewise wrote romances; but not such virtuous ones as used to be wrote at that time. He was a declared enemy of the Jansenists. His visions are well described by the Messieurs de Port Royal. He promised the king of France, by the explication of prophecies, the honour of overthrowing the Mahometan empire. In his last years he wrote something against Boileau's Satires.

MARETS (Samuel de), one of the most celebrated divines of the reformed church, was born in Picardy, in 1599. In 1620, he was settled in the church of Laon; but, in 1624, accepted a call to that of Sedan: in 1642, he obtained a professorship at Groningen; and, from that time to his death, exerted himself so much in the service of that university, that it was reckoned one of the most flourishing in the Netherlands. His System of Divinity was found to be so methodical, that it was made use of at other academies; and at the end of it may be found a chronological table of all his works. Their number is prodigious; and their variety shows the extent of his genius. He was moreover engaged in many disputes and controversies, and

died in 1673.

MARGARET (countess of Richmond and Derby), the learned and pious mother of Henry VII. was born at Bethoe in Bedfordshire, in 1441; and was the sole heiress of John Beaufort, duke of Somerset, grandson to John of Gaunt. Her mother was the heiress of lord Beauchamp of Powick. Whilst yet very young, the great duke of Suffolk, minister to Henry VI. or rather to queen Margaret, sought her in marriage to his son; and she was at the same time solicited by the king for his half-brother Edmund, earl of Richmond. To the latter she gave her hand. Henry VII. was the sole fruit of this marriage, his father dying when he was but 15 weeks old. Her second husband was Sir Henry Stafford, knight, second son to the duke of Buckingham; by whom she had no issue. Soon after his death, which happened in the year 1482, she sought consolation in a third husband, Thomas lord Stanley, who, in the first year of her son's reign, was created earl of Derby. He died in the year 1504, without issue, being then high constable of England. She survived her lord not quite five years, dying at Westminster in June 1509, in the 69th year of her age. She was buried in Henry VII.'s chapel, on the south-side of which was erected to her memory an altar-tomb of black marble, with her statue of brass.

From her funeral sermon preached by her confessor bishop Fisher, who, says Ballard, knew the very secrets of her soul, we learn, "that she possessed almost all things that were commendable in a woman, either in mind or body." She understood the French language perfectly, and had some knowledge of the Latin. She was devout even to austerity, in humility romantic, profuse in the encouragement of learning, and singularly chaste; but this last virtue became conspicuous only towards the latter end of a third marriage. "In her last husband's days (says Baker), she obtained a licence of him to live chaste, whereupon she took upon her the vow of celibacy." "A boon, (says Mr Walpole), as seldom requested, I believe, of a third husband, as it probably would be easily granted." Her life, from the turbulence of the times, and vicissitude of her son's fortune, must necessarily have been subject to infinite disquiet, which however she is said to have supported with singular fortitude.—She wrote, 1. The mirroure of golde for the sinful soule, translated from a French translation of a book called *Speculum aureum peccatorum*. Emprynted at London, in Flete-strete, at the signe of St George, by Richard Pynson, quarto, with cuts on vellum. 2. Translation of the fourth book of Dr Gerfen's treatise of the imitation and following the blessed life of our most merciful Saviour Christ. Printed at the end of Dr Wm. Atkinson's English translation of the three first books, 1504. 3. A letter to the king; in Howard's collection. 4. By her son's order and authority, she also made the Orders for great estates of ladies and noble women, for their precedence, and wearing of barbes at funerals, over the chin and under the same.

MARGARET, the daughter of Woldemar III. king of Denmark, styled the *Semiramis of the North*: she succeeded her father in the throne of Denmark, her husband in that of Norway, and the crown of Sweden was given her as a recompence for delivering the Swedes from the tyranny of Albert their king. Thus  
pos-

Margaret.

Margaret  
Maria.

possessed of the three kingdoms, she formed the grand political design of a perpetual union, which she accomplished, *pro tempore* only, by the famous treaty styled the *union of Colmar*. She died in 1412, aged 59.

MARGARET of Anjou, daughter of René D'Anjou, king of Naples, and wife of Henry VI. king of England; an ambitious, enterprising, courageous woman. Intrepid in the field, she signalized herself by heading her troops in several battles against the house of York; and if she had not been the authoress of her husband's misfortunes, by putting to death the duke of Gloucester his uncle, her name would have been immortalized for the fortitude, activity, and policy with which she supported the rights of her husband and son, till the fatal defeat at Tewksbury; which put an end to all her enterprises, the king being taken prisoner, and prince Edward their only son basely murdered by Richard duke of York. Margaret was ransomed by her father, and died in Anjou in 1482. See ENGLAND, n° 190.—198.

MARGARITA, or PEARL-ISLAND, an island of South America, the middle of which is seated in W. Long. 64. 2. N. Lat. 11. 30. It was discovered by Columbus, and is about 35 leagues in compass. The soil is very fertile in maize and fruits, and abounds in pasture and verdant groves; yet is totally destitute of fresh water, which the inhabitants are obliged to bring from the continent. When the Spaniards first landed here, they found the natives busy in fishing for oysters. Columbus ordered some of the savages aboard his ship, who were so far from being terrified, that they very soon became familiar with the Spaniards. The latter at first imagined that the oysters served them for food; but on opening the shells, they found they contained valuable pearls. Upon this discovery they immediately landed, and taught the natives ready to part with their pearls for the merest trifles. In process of time the Spaniards built a castle, called *Monpadre*, and employed prodigious numbers of Guinea and Angola Negroes in the pearl-fishery; cruelly forcing them to tear up the oysters from the rocks to which they stuck, during which time many of them were destroyed by the sharks and other voracious fishes. In 1620, this island was invaded by the Dutch, who demolished the castle upon it: since which time it has been in a manner abandoned by the Spaniards; and is now principally inhabited by the natives, to whom some particular indulgences were granted by the court of Spain, on account of their ready submission to Columbus.

MARGARITA, a general name for the navy of a kingdom or state; as also the whole œconomy of naval affairs; or whatever respects the building, rigging, arming, equipping, navigating, and fighting ships. It comprehends also the government of naval armaments, and the state of all the persons employed therein, whether civil or military.

MARGATE, a sea-port town of Kent, in the isle of Thanet, much frequented in the summer-time for bathing in the salt-water. E. Long. 1. 30. N. Lat. 51. 24.

MARIA, or SANCTA MARIA, an island of the Indian Ocean, lying about five miles east from Madagascar. It is about 27 miles long, and five broad; well watered, and surrounded by rocks. The air is extremely moist, for it rains almost every day. It is inhabited by 500 or 600 negroes, but seldom visited by ships.

MARIA (St.), a considerable town of South America, in the audience of Panama, built by the Spaniards

after they had discovered the gold mines near it, and soon after taken by the English. It is seated at the bottom of the Gulf of St Michael, at the mouth of a river of the same name; which is navigable, and the largest that falls into the gulf. The Spaniards come here every year in the dry season, which continues three months, to gather the gold-dust out of the sands of the neighbouring streams; and carry away great quantities. W. Long. 148. 30. N. Lat. 7. 0.

MARIA (St.), a handsome and considerable town of Spain, in Andalusia, with a small castle. It was taken by the English and Dutch in 1702, for the archduke of Austria. It is seated on the Guadaleta, at the mouth of which is a tower and a clove battery. W. Long. 5. 33. N. Lat. 36. 35.

MARIAN ISLANDS. See LADRONE ISLANDS.

MARIANA (John), a learned Spanish historian, born at Talavera in the diocese of Toledo. He entered among the Jesuits in 1554, at 17 years of age; and became one of the most learned men of his time. He was a great divine, a good humanist, and profoundly versed in ecclesiastical as well as profane history. He taught at Rome, in Sicily, at Paris, and in Spain; and died at Toledo in 1624. His principal works are, 1. An excellent history of Spain in 30 books; which he himself translated from the Latin into Spanish, without severely following his own Latin edition. 2. *Scholia*, or short notes on the bible. 3. A treatise on the changes the species has undergone in Spain; for which he was thrown into prison by the duke of Lerma, the Spanish minister. 4. A famous treatise *De rege et regis institutione*, which made much noise, and was condemned by the parliament of Paris to be burnt by the hands of the common hangman, for his asserting in that work, that it is lawful to murder tyrants. 5. A work on the faults of the government of the society of Jesuits, which has been translated into Spanish, Latin, Italian, and French, &c.

MARIANUS SCORUS, an Irish monk, was related to the Venerable Bede, and wrote a chronicle which is esteemed. He died in the abbey of Fuld, in 1086, aged 58.

MARIGALANTE, an island of North America, and one of the least of the Caribbees. It was discovered by Christopher Columbus in 1493; the French settled here in 1648; and it was taken by the English in 1691, but the French soon got possession of it again. The land is proper for sugar-canes, indigo, tobacco, and cotton; but sometimes they are in great want of water. W. Long. 60. 51. N. Lat. 16. 32.

MARINE, a general name for the navy of a kingdom or state; as also the whole œconomy of naval affairs; or whatever respects the building, rigging, arming, equipping, navigating, and fighting ships. It comprehends also the government of naval armaments, and the state of all the persons employed therein, whether civil or military.

The history of the marine affairs of any one state is a very comprehensive subject, much more that of all nations. Those who would be informed of the maritime affairs of Great Britain, and the figure it has made at sea in all ages, may find abundance of curious matter in Selden's *Mare Clausum*; and from his time to ours, we may trace a series of facts in Lediard's and Burchet's Naval History, but above all in the Lives

Maria  
Marine.

Marines  
&  
Mariner.

of the Admirals, by the accurate and judicious Dr Campbell.

**MARINES**, or *MARINE Forces*, a body of soldiers raised for the sea-service, and trained to fight either in a naval engagement, or in an action ashore.

The great service of this useful corps was manifested frequently in the course of the late war, particularly at the siege of Belleisle, where they acquired a great character, although lately raised and hardly exercised in military discipline. At sea they are incorporated with the ship's crew, of which they make a part; and many of them learn in a short time to be excellent seamen, to which their officers are ordered by the admiralty to encourage them, although no sea-officer is to order them to go aloft against their inclination. In a sea-fight their small-arms are of very great advantage in scouring the decks of the enemy; and when they have been long enough at sea to stand firm when the ship rocks, they must be infinitely preferable to seamen if the enemy attempts to board, by raising a battalion with their fixed bayonets to oppose him.

The marine forces of Great Britain in the time of peace are stationed in three divisions; one of which is quartered at Chatham, one at Portsmouth, and another at Plymouth. By a late regulation, they are ordered to do duty at the several dock-yards of those ports, to prevent embezzlement of the king's stores, for which a captain's guard mounts every day; which certainly requires great vigilance, as so many abuses of this kind have been committed, that many of the inhabitants, who have been long used to an infamous traffic of this kind, expect these conveyances at certain periods as their due, and of course resent this regulation in the highest degree as an infringement of their liberties as British subjects.

**MARINE Discipline**, is the training up soldiers for sea-service, in such exercises as the various positions of the firelock and body, and teaching them every manœuvre that can be performed on board ships of war at sea. See **EXERCISE**.

**MARINE Chair**, a machine invented by Mr Irwin, for viewing the satellites of Jupiter at sea, and of course determining the longitude by their eclipses. An account of it is given in the *Journal Estranger* for March 1760. An account of its accuracy was published the year following, by M. de L'Isle astronomer in the imperial academy of Petersburg; but notwithstanding the encomiums bestowed upon it by this gentleman, it hath never come into general use; and therefore we may conclude, that it is much inferior to the inventions of Mr Harrison for the same purpose. See **HARRISON** and **NAVIGATION**.

**MARINER**, the same with a sailor or seaman. See these articles.

*Method of Preserving the Health of MARINERS*. See **SEAMEN**.

**MARINER'S Compass**. See **COMPASS**.

The invention of the compass is usually ascribed to Flavio da Melfi, or Flavio Gioia, a Neapolitan, about the year 1302; and hence it is, that the territory of Principato, which makes part of the kingdom of Naples, where he was born, has a compass for its arms. Others say that Marcus Paulus, a Venetian, making a journey to China, brought back the invention with him in 1260. What confirms this conjecture is, that

at first they used the compass in the same manner as the Chinese still do; i. e. they let it float on a little piece of cork, instead of suspending it on a pivot. It is added, that their emperor Chiningus, a celebrated astrologer, had a knowledge of it 1120 years before Christ. The Chinese only divide their compass into 24 points. Fauchette relates some verses of Guyot de Provence, who lived in France about the year 1200, which seem to make mention of the compass under the name of *marinette*, or *mariner's stone*; which shew it to have been used in France near 100 years before either the Melisite or Venetian. The French even lay claim to the invention, from the *fleur de lys* wherewith all nations still distinguish the north point of the card. With as much reason Dr Wallis ascribes it to the English, from its name *compass*, by which name most nations call it, and which he observes is used in many parts of England to signify a circle.

The compass hath sometimes been observed to be disturbed by the electricity of its glass-cover; and this from so slight an application of the finger as was barely necessary to wipe off a little dust. The same glass, rubbed a little more with the finger, a bit of muslin, or paper, would attract either end of the needle, so as to hold it to the glass for several minutes, far out of the due direction, according to that part of the glass which was most excited. And when the needle, after adhering to the glass, has dropped loose, and made vibrations, those would not be bisected as usual by that point where the needle should rest; but would either be made all on one side, or be very unequally divided, by means of some remains of electrical virtue in that part of the glass which had attracted the needle, until at length, after 15 minutes or more, all the electricity being discharged, the magnetical power took place. The remedy for this inconvenience is to moisten the surface of the glass: a wet finger will do it immediately and effectually. The mariner's compass with a chart is much less dangerously moved than the common compass with a bare needle: and the deeper, or farther distant, the needle hangs below the glass, the less disturbance it is likely to receive.

**ST MARINO**, a small town and republic of Italy, situated in E. Long. 13. 44. N. Lat. 44. 21. This small republic consists only of a mountain, and a few hillocks, that lie scattered about the bottom of it. The number of the inhabitants is about 5000. The mountain yields good wine, but they have no other than rain or snow water. The founder of the republic was a Dalmatian, and a mason, who upwards of 1300 years ago turned hermit, and retired to this mountain. Here his devotion and austerity, and, in consequence of that, his reputation for sanctity, were such, that the princeps of the country made him a present of the mountain, on which many, out of veneration for the saint, soon after took up their abode. Thus was the foundation laid of the town and republic, which still bears the name of the saint. The town stands on the top of the mountain, and there is only one way by which it can be come at. In the whole territory are only three castles, three convents, and five churches. The largest of the churches is dedicated to the saint, and contains his ashes and his statue. He is looked upon as the greatest saint, next to the blessed Virgin; and to speak disrespectfully of him is accounted blasphemy, and punished

Mariner,  
Marino.

nished as such. The republic is under the protection of the pope. All that are capable of bearing arms are exercised, and ready at a minute's call. In the ordinary course of government, the administration is in the hands of the council of 60, which, notwithstanding its name, consists only of 40; one half of the members of which are of the noble families, and the other of the plebeian: on extraordinary occasions, however, the *arengo*, in which every house has its representative, is called together. The two principal officers are the capitaneos, who are chosen every half year; and next to them is the commissary, who judges in civil and criminal matters, and is joined in commission with the capitaneos; both he and the physician must be foreigners, and both have their salaries out of the public stock. When any person, after due summons, neglects to assist at the council according to their statute-book, he is to be fined in about a penny English; and when an ambassador is to be sent to any foreign state, he is to be allowed about 18. a-day.

MARINO (John Baptist), a celebrated Italian poet, born at Naples in 1569. His father, who was an able civilian, obliged him to study the law; at which being disgusted, he left his parents, and retired to the house of the Sieur Manzi, who was a friend to all persons of wit. He at length became secretary to Matthew of Capua, great admiral of the kingdom of Naples, and contracted a friendship with Tasso. A short time after, he went to Rome, and entered into the service of cardinal Aldobrandini, nephew to pope Clement VIII. who took him with him to Savoy. Marino was in great favour with the court of Turin; but afterwards created himself many enemies there, the most furious of whom was the poet Gaspard Murtola, who, attempting to shoot him with a pistol, wounded one of the duke of Savoy's favourites. Marino being obliged to leave Turin, went to Paris at the desire of queen Mary de Medicis, and published there his poem on Adonis. He afterwards went to Rome, where he was made prince of the academy of the humoristi; from thence to Naples, where he died while he was preparing to return home. He had a very lively imagination, but little judgment; and, giving way to the points and conceits then in vogue, his authority, far from correcting the false taste of the Italians, served rather to keep it farther from reformation. His works, which are numerous, have been often printed.

MARIOTTE (Edme), an eminent physician and mathematician, was born in Burgundy, and was made a member of the academy of sciences. He died in 1684. His works, which are much esteemed, were printed at Leyden in 1717, 2 vols 4to.

MARJORAM, in botany. See ORIGANUM.

MARTAGIUM, that portion which is given with a daughter in marriage.

MARITAGIUM, or Marriage, strictly taken, is that right which the lord of the fee had, to marry the daughters of his vassals after their death: Others tell us, it was that profit which might accrue to the lord, by the marriage of one under age, who held his lands of him by knight's service.

MARITIME, something relating to, or bounded by the sea. Thus a maritime province, or country, is one bounded by the sea; and a maritime kingdom is one that makes a considerable figure, or that is very

powerful at sea. Hence, by *maritime* powers among the European states, are understood Great Britain and Holland.

MARITIME State, in British polity, one of the three general divisions of the laity: (See LAITY.) This state is nearly connected with the military; though much more agreeable to the principles of our free constitution. The royal navy of England hath ever been its greatest defence and ornament; it is its ancient and natural strength; the floating bulwark of the island; an army, from which, however strong and powerful, no danger can ever be apprehended to liberty; and accordingly it has been assiduously cultivated from the earliest ages. To so much perfection was our naval reputation arrived in the 12th century, that the code of maritime laws, which are called the *laws of Oleron*, and are received by all nations in Europe as the ground and substruction of all their marine constitutions, was confessedly compiled by our king Richard I. at the isle of Oleron on the coast of France, then part of the possessions of the crown of England. And yet, so vastly inferior were our ancestors in this point to the present age, that even in the maritime reign of queen Elizabeth, Sir Edward Coke thinks it matter of boast, that the royal navy of England then consisted of *three and thirty* ships. The present condition of our marine is in great measure owing to the salutary provisions of the statutes called the *navigation acts*; whereby the constant increase of English shipping and seamen was not only encouraged, but rendered unavoidably necessary. By the statute 5 Ric. II. c. 3. in order to augment the navy of England, then greatly diminished, it was ordained, that none of the king's liege people should ship any merchandise out of or into the realm, but only in ships of the king's licence, on pain of forfeiture. In the next year, by statute 6 Ric. II. c. 8. this wise provision was enervated, by only obliging the merchants to give English ships (if able and sufficient) the preference. But the most beneficial statute for the trade and commerce of these kingdoms is that navigation-act, the rudiments of which were first framed in 1650, with a narrow partial view; being intended to mortify our own sugar-islands, which were disaffected to the parliament, and still held out for Charles II. by stopping the gainful trade which they then carried on with the Dutch, and at the same time to clip the wings of those our opulent and aspiring neighbours. This prohibited all ships of foreign nations from trading with any English plantations, without license from the council of state. In 1651, the prohibition was extended also to the mother-country: and no goods were suffered to be imported into England, or any of its dependencies, in any other than English bottoms; or in the ships of that European nation, of which the merchandise imported was the genuine growth or manufacture. At the Restoration, the former provisions were continued, by stat. 12 Car. II. c. 18. with this very material improvement, that the master and three-fourths of the mariners shall also be English subjects.

Many laws have been made for the supply of the royal navy with seamen; for their regulation when on board; and to confer privileges and rewards on them during and after their service.

1. For their supply. The principal, but the most odious, though often necessary method for this purpose, is by impressing; see IMPRESSING. But there are other ways that tend to the increase of seamen, and manning the royal navy. Parishes may bind out poor boys apprentices to the masters of merchantmen, who shall be protected from impressing for the first three years; and if they are impressed afterwards, the masters shall be allowed their wages: great advantages in point of wages are given to volunteer seamen, in order to induce them to enter into his majesty's service: and every foreign seaman, who, during a war, shall serve two years in any man of war, merchantman, or privateer, is naturalized *ipso facto*. About the middle of king William's reign, a scheme was set on foot for a register of seamen to the number of 30,000, for a constant and regular supply of the king's fleet; with great privileges to the registered men, and, on the other hand, heavy penalties in case of their non-appearance when called for: but this registry, being judged to be rather a badge of slavery, was abolished by stat. 9 Ann. c. 21.

2. The method of ordering seamen in the royal fleet, and keeping up a regular discipline there, is directed by certain express rules, articles, and orders, first enacted by the authority of parliament soon after the Restoration; but since new-modelled and altered, after the peace of Aix-la-Chapelle, to remedy some defects which were of fatal consequence in conducting the preceding war. In these articles of the navy almost every possible offence is set down, and the punishment thereof annexed: in which respect the seamen have much the advantage over their brethren in the land-service; whose articles of war are not enacted by parliament, but framed from time to time at the pleasure of the crown. Yet from whence this distinction arose, and why the executive power, which is limited so properly with regard to the navy, should be so extensive with regard to the army, it is hard to assign a reason; unless it proceeded from the perpetual establishment of the navy, which rendered a permanent law for their regulation expedient, and the temporary duration of the army, which subsisted only from year to year, and might therefore with less danger be subjected to discretionary government. But, whatever was apprehended at the first formation of the mutiny-acts, the regular renewal of our standing force at the entrance of every year has made this distinction idle. For, if from experience past, we may judge of future events, the army is now lastingly ingrafted into the British constitution; with this singularly fortunate circumstance, that any branch of the legislature may annually put an end to its legal existence, by refusing to concur in its continuance.

3. With regard to the privileges conferred on sailors, they are pretty much the same with those conferred on soldiers; with regard to relief, when maimed, or wounded, or superannuated, either by county-rates, or the royal hospital at Greenwich; with regard also to the exercise of trades, and the power of making nuncupative testaments: and, farther, no seaman aboard his majesty's ships can be arrested for any debt, unless the same be sworn to amount to at least twenty pounds; though, by the annual mutiny-acts, a soldier may be arrested for a

debt which extends to half that value, but not to a less amount.

MARIUS, the Roman general, and seven times consul, who fulfilled his great military reputation by savage barbarities, died about 86 B. C.

St MARK the *Evangelist's Day*, a festival of the Christian church, observed April 25.

St Mark was by birth a Jew, and descended of the tribe of Levi. He was converted by some of the apostles, probably by St Peter; to whom he was a constant companion in all his travels, supplying the place of an amanuensis and interpreter. He was by St Peter sent into Egypt, fixing his chief residence at Alexandria, and the places thereabout: where he was so successful in his ministry, that he converted multitudes both of men and women. He afterwards removed westward, towards the parts of Libya, going through the countries of Marmorea, Pentapolis, and others thereabouts; where, notwithstanding the barbarity and idolatry of the inhabitants, he planted the gospel. Upon his return to Alexandria, he ordered the affairs of that church, and there suffered martyrdom in the following manner. About Easter, at the time the solemnities of Serapis were celebrated, the idolatrous people, being excited to vindicate the honour of their deity, broke in upon St Mark, while he was performing divine service, and, binding him with cords, dragged him through the streets, and thrust him into prison, where in the night he had the comfort of a divine vision. Next day, the enraged multitude used him in the same manner, till, his spirits failing, he expired under their hands. Some add, that they burnt his body, and that the Christians decently interred his bones and ashes near the place where he used to preached. This happened in the year of Christ 68.

Some writers assert, that the remains of St Mark were afterwards, with great pomp, translated from Alexandria to Venice. However, he is the tutelar saint and patron of that republic, and has a very rich and stately church erected to his memory.

Some have confounded this evangelist with John Mark so often spoken of in the Acts of the Apostles: but this opinion is now generally given up. This apostle is author of one of the four gospels inscribed with his name. See the following article.

St MARK's Gospel, a canonical book of the New Testament, being one of the four gospels.

St Mark wrote his gospel at Rome, where he accompanied St Peter in the year of Christ 44. Tertullian and others pretend, that St Mark was no more than an amanuensis to St Peter, who dictated this gospel to him; others affirm, that he wrote it after St Peter's death. Nor are the learned less divided as to the language it was wrote in; some affirming it was composed in Greek, others in Latin. Several of the ancient heretics received only the gospel of St Mark: others, among the Catholics, rejected the 12 last verses of this gospel. The gospel of St Mark is properly an abridgement of that of St Matthew.

Canons of St MARK, a congregation of regular canons, founded at Mantua, by Albert Spinola a priest, towards the end of the 12th century. Spinola made a rule for them, which was approved, corrected, and confirmed by several succeeding popes. About the year

Mark  
Marlborough.

year 1450, they were reformed, and followed only the rule of St Augustine. This congregation having flourished by the space of 400 years, declined by little and little, and is now become extinct.

*Knights of St MARK*, an order of knighthood in the republic of Venice, under the protection of St Mark the evangelist. The arms of the order are, gules, a lion winged or; with this device, PAX TIBI MARCE EVANGELISTA. This order is never conferred but on those who have done signal service to the commonwealth.

MARK, or *Marc*, also denotes a weight used in several states of Europe, and for several commodities, especially gold and silver. In France, the mark is divided into eight ounces, 64 drachms, 192 deniers or penny-weights, 160 esterlins, 300 mailles, 640 felins, or 4608 grains. In Holland, the mark weight is also called *Troy-weight*, and is equal to that of France. When gold and silver are sold by the mark, it is divided into 25 carats.

MARK, is also used among us for a money of account, and in some other countries for a coin. See MONEY-Table.

The English mark is two thirds of a pound Sterling, or 12 s. 4 d. and the Scotch mark is of equal value in Scots money of account, viz. 13  $\frac{1}{2}$  d.

MARKET, a public place in a city or town, in which live-cattle, provisions, or other goods, are set to sale; and also a privilege, either by grant or prescription, by which a town is enabled to keep a market.

MARKHAM (Gervase), an English author, was the son of Robert Markham of Gotham, esq; in Nottinghamshire, and bore a captain's commission under Charles I. in the civil wars. He was esteemed both a good soldier and a good scholar. He was particularly master of the French, Italian, and Spanish. He wrote, 1. The tragedy of Herod and Antipater, which was printed in 1622. 2. Many volumes upon husbandry and horsemanship. 3. A piece on the art of fowling. 4. The soldiers accident and grammar.

MARKLAND (Jeremiah,) one of the most learned scholars and penetrating critics of the age, was born in 1692, and received his education in Christ's hospital. He became first publicly known by his "*Epistola Critica*," addressed to bishop Hare. In this he gave many proofs of extensive erudition and critical sagacity. He afterwards published an edition of Statius, and some plays of Euripides; and assisted Dr Taylor in his editions of *Lyfias* and *Demosthenes*, by the notes which he communicated to him. He has also very happily elucidated some passages in the New Testament, which may be found in Mr Bowyer's edition of it; and was author of a very valuable volume of remarks on the epistles of Cicero to Brutus, and of an excellent little treatise under the title of *Quaestio Grammatica*. He died in 1775, at Milton, near Dorking in Surrey; and was a man not more valued for his universal reading, than beloved for the excellency of his heart and primitive simplicity of manners.

MARLBOROUGH, a town of Wiltshire in England, so called, as some think, from its chalky soil. It is an ancient borough by prescription, and sends two members to parliament. It has suffered greatly by

fire; particularly, in 1728, there was such a conflagration, that, if the street had not been very broad, the whole town would probably have been burnt down.

MARLBOROUGH (duke of). See CHURCHILL.

MARLBOROUGH-FORT, an English factory on the west coast of the island of Sumatra in Asia; seated three miles west of the town of Bencoolen. E. Long. 101. 12. S. Lat. 4. 21.

MARLE, a kind of calcareous earth, very much used in agriculture as a manure. See AGRICULTURE, n<sup>o</sup> 169, 170.

Marle is dug in many places of Great Britain and Ireland. In digging for it in Ireland, they meet with horns and other curious fossils. The marle always lies in the bottoms of low bogs, and is found by boring with augres made for that purpose. It usually lies at five, seven, or nine feet depth. The obtaining it in many places is attended with very considerable expenses in draining off the water. The manner of digging it is this: They employ six able labourers and a supernumerary; and these cut up a hole of 12 feet square, which is supposed a pit that this number of men can manage in one day. Two men dig, two throw it up, and two throw it by, and the supernumerary man supplies defects on all occasions. For the first three feet they dig through a fuzzy earth, fit for making of turf or fuel. Under this lies a stratum of gravel, of about half a foot: under this often, for three feet more, there is a more kindly moss, which would make better fuel. This lower stratum is always full of fossil wood, which is usually so soft, that the spade cuts as easily through it as through the earth it lies in. Under this, for the thickness of about three inches, is found a series of leaves, principally of the oak. These appear very fair to the eye, but fall to pieces on being touched; and this stratum is sometimes interrupted by vast heaps of feed, which seem to be broom or furze feed. In some places there appear berries of different kinds, and in others several species of sea-plants; all lying in the same confused manner as the oak-leaves. Under this vegetable stratum there lies one of blue clay, half a foot thick, and usually full of sea-shells. This blue clay is not so tough as common clay; but is thrown carefully up, and used as marle in some places. Under this always appears the true marle; the stratum of which is usually from two to four feet thick, and sometimes much more.—This marle looks like buried lime, and is full of shells; which are usually of a small size, and of the periwinkle kind; but there are several other sorts at times found among them. Among this marle, and often at the very bottom of it, are found great numbers of very large horns of the deer kind, which are vulgarly called *elk's horns*. These, where they join to the head, are thick and round; and at that joining there grows out a branch, which is about a foot long, and seems to have hung just over the creature's eyes: it grows still round for about a foot above this; and then spreads out broad, and terminates in branches long and round, terminating with a small bend. The labourers are obliged to work in a hurry in all these pits, so that they seldom bring out the horns whole. There are also, at times, found the leg-bones and other parts of the skeletons of the same beasts; but this more rarely, only a few

Marlborough,  
Marle.

Marle  
Marloe.

few together, and but in few places.

Dr Black is of opinion, that all kinds of marle derive their origin from the calcareous matter of shells and lithophyta.

Shell-marle, says he, is composed of the shells of aquatic animals, which are sometimes very entire, and often decayed or mixed down with other earthy substances. Examining this matter as occurring in different places, it may be distinguished into fresh-water marle, and the marle of sea-shells. Of the first we have an example in the Meadow at Edinburgh. Wherever the soil is turned up to the depth of six inches, a quantity appears. It is composed of the shells of a small fresh-water snail or welk. This animal, when alive, is not easily discernible, the shell being much of the same obscure colour as the stones covered with the water. But we can observe a great number of them in all running brooks and other collections of fresh water; and as the animal dies the shells are deposited where the water stagnates in very great quantity. That composed of sea shells, constitutes greater collections that are found in innumerable places now far removed from the sea. That most particularly described by Reaumur is a collection of this kind in a province of France, and at Turin. That part of the country where it is found is computed to contain 80 square miles of surface; and wherever they dig to a certain depth, they find this collection of shells: the country at present is 108 miles from the sea. They find the marle eight or nine feet below the surface, and they dig it to the depth of 20 feet. It is still deeper, but they find it too expensive to search for it. He supposes it to be only 18 feet deep; and even at this depth the quantity will appear enormous. It will amount to 140 millions of cubic fathoms of shells that are mostly decayed and broken into fragments, and mixed with other marine productions, as millipores, madripores, and other coralline bodies, which are all productions of the sea.

MARLIN, in sea-affairs, are tarred white skains, or long wreaths or lines of untwisted hemp, dipped in pitch or tar, with which cables and other ropes are wrapped round, to prevent their fretting or rubbing in the blocks or pulleys through which they pass. The same serves in artillery upon ropes used for rigging gins, usually put up in small parcels called *skains*.

MARLOE (Christopher), an English dramatic author, was a student in the university of Cambridge; but afterwards turning player, he trode the same stage with the inimitable Shakespeare. He was accounted an excellent poet even by Ben Johnson himself. He wrote six tragedies, one of which called *Luff's Dominion*, or the *Lascivious Queen*, has been altered by Mrs Behn, and acted under the title of *Abdelazar, or the Moor's Revenge*. Some time before his death, he had made a considerable progress in an excellent poem entitled *Hero and Leander*; which was afterwards finished by George Chapman, who is said to have fallen short of the spirit and invention discovered by Marloe. Mr Anthony Wood represents him as a free-thinker, in the worst sense of the word; and gives the following account of his death. Falling deeply in love with a low girl, and having for his rival a fellow in livery, Marloe, imagining that his

mistress granted him favours, was fired with jealousy, and rushed upon him in order to stab him with his dagger: but the footman avoided the stroke, and, seizing his wrist, stabbed him with his own weapon; of which wound he died, in the year 1593.

MARLOW, a town of Buckinghamshire, in England, seated on the river Thames, over which there is a bridge into Berkshire. It sends two members to parliament. W. Long. o. 45. N. Lat. 51. 34.

MARLY, a palace belonging to the king of France, between Versailles and St Germain; seated in a valley, near a village and forest of the same name. It is noted for its fine gardens and water-works, there being a curious machine on the river Seine, which not only supplies them with water, but also those of Versailles. It is 10 miles N. W. of Paris. E. Long. 2. 11. N. Lat. 48. 52.

MRMANDE, a town of France, in Guienne, and in Agennois. It carries on a great trade in corn and wine, and is seated on the river Garonne, in E. Long. o. 15. N. Lat. 38. 35.

MARMALADE, a confection of plums, apricots, quinces, &c. boiled up to a consistence with sugar.

MARMOR. See MARBLE.

MARMORA, the name of four islands of Asia, in the sea of the same name. The largest is about 30 miles in circumference; and the soil of them all produces corn, wine, and fruits. The sea of Marmora is a large gulph, which communicates both with the Archipelago and the Black Sea by that of Constantinople, being 120 miles in length, and 50 in breadth, and all ships must pass through it that sail to Constantinople from the Mediterranean. It was anciently the *Propontis*.

MARMORICA, a country of Africa anciently inhabited by the Libyans. It was bounded on the east by Egypt, on the west by Cyrenaica, on the south by Sahara, or the desert of Libya Interior, and on the north by the Mediterranean; and was reckoned a part of Egypt. There is no distinct history of the country.

MARONITES, certain eastern Christians so called, who inhabit near mount Libanus in Syria. The name is derived either from a town in the country, called *Maronia*; or from *St Maron*, who built a monastery there in the fifth century.

The Maronites hold communion with the Romish church. Pope Gregory XIII. founded a college at Rome, where their youth are educated, and then sent to their own country. They formerly followed the errors of the Jacobites, Nestorians, and Monothelites; but they were re-united to the Roman church in the time Gregory XIII. and Clement VIII. The patriarch of the Maronites was present in the fourth Lateran Council, under Innocent III. in 1215.

The Maronites have their patriarch, archbishops, bishops, and about 150 inferior clergy, who are so oppressed by the Turks, that they are reduced to work for their living. They keep Lent according to the ancient rigour, eating but one meal a-day, and that after mass, which is said at 4 o'clock in the afternoon. Their priests are distinguished by a blue scarf, which they wear about their caps. Married men may become priests, but none may marry after he is ordained. They wear no surplices, observe particular fasts

and

Marlow  
Maronites.

Maroon, and castles, and differ in many other things from the church of Rome.

The patriarch of the Maronites is a monk of St Anthony, claims the title of patriarch of Antioch, and is always called *Peter*. He has about nine bishops under him; and resides at Edem Canobin, a monastery built on a rock. They read their service both in the vulgar language and in Latin; and, while they perform it, turn their heads sometimes on one side, and sometimes on the other, pronouncing the word *Num* or *Eynam* softly, which signifies *yes*, or *yes verily*, by which they express their assent to what they read. They have so great a veneration for their bishops, that they often prostrate themselves before them.

In 1180, the Maronites were above 40,000 in number, and very valiant. They did the kings of Jerusalem great service against the Saracens.

Besides several convents of Maronite monks, there is one of nuns, who are highly esteemed for their sanctity. This edifice is no more than a church, in which the nuns are shut up close, like pigeons in their holes, in little corners or cells, which are so low, that few of them can stand upright or turn themselves round in them.

To MAROON, to put one or more sailors ashore upon a desolate island, under pretence of their having committed some great crime. This detestable expedient has been repeatedly practised by some inhuman commanders of merchant-ships, particularly in the West Indies.

MAROT (CLEMENT), the best French poet of his time, was born at Cahors in 1495; and was the son of John Marot, valet de chambre to Francis I. and poet to queen Anne of Brittany. He enjoyed his father's place of valet de chambre to Francis I. and was page to Margaret of France wife to the duke of Alençon. In 1522 he followed that prince into Italy, and was wounded and taken prisoner at the battle of Pavia; but at his return to Paris was accused of heresy, and thrown into prison, from whence he was delivered by the protection of king Francis I. He at length retired to the queen of Navarre, then to the dukes of Ferrara, and in 1536 returned to Paris; but declaring openly for the Calvinists, he was obliged to fly to Geneva, which he at length left, and retired to Piedmont, and died at Turin in 1544, aged 50. His verses are agreeably filled with natural beauties. La Fontaine acknowledged himself his disciple, and contributed greatly to restore to vogue the works of this ancient poet. Marot, besides his other works, has translated part of the Psalms into verse, which was continued by Beza, and are still sung in the Protestant churches abroad.—Michael Marot, his son, was also the author of some verses; but they are not comparable to those of John, and much less to those of Clement Marot.—The works of the three Marots were collected and printed together at the Hague, in 1731, in 3 vols 4to. and in 6 vols 12mo.

MARPURG, a strong and considerable town of Germany, in the Upper Rhine, and in the landgrate of Hesse-Cassel, with an university, a castle, a palace, a handsome square, and a magnificent town-house. It is seated on the river Lahn, in a pleasant

country, 15 miles south of Waldeck, and 47 south-west of Cassel. E. Long. 8. 53. N. Lat. 50. 42.

MARPURG, a handsome town of Germany, in Lower Styria, seated on the river Drave, 25 miles south-west of Gratz, and 60 north-east of Laubach. E. Long. 16. 10. N. Lat. 46. 42.

MARQUARD (Freher), an eminent German civilian, born at Augsburg in 1565. He studied at Bourges, under the learned Cujas; and acquired great skill in polite literature, and in the laws. At his return to Germany, he became counsellor to the elector Palatine, and professor of law at Heidelberg; and was afterwards sent by the elector Frederic IV. as his minister, into Poland, to Mentz, and several other courts. He died at Heidelberg in 1614. He wrote many works which are esteemed; the principal of which are, 1. *De re monetaria veterum Romanorum, & hodierni apud Germanos imperii.* 2. *Rerum Bohemicarum scriptores.* 3. *Rerum Germanicarum scriptores.* 4. *Corpus historię Franciæ, &c.*

MARQUE, or Letters of MARQUE, in military affairs, are letters of reprisal, granting the subjects of one prince or state liberty to make reprisals on those of another.—They are so called from the German *marcke*, "limit, frontier;" as being *jus concessum in alterius principis marchas seu limites transseundi, sibiue ejus faciendi*; as being a right of passing the limits or frontiers of another prince, and doing one's self justice.

Letters of marque among us are extraordinary commissions granted by authority for reparation to merchants taken and despoiled by strangers at sea; and reprisals is only the retaking, or taking of one thing for another \*. The form in these cases is, the sufferer \* See Pre-must first apply to the lord privy-seal, and he shall make out letters of request under the privy-seal; and if, after such request of satisfaction made, the party required do not, within convenient time, make due satisfaction or restitution to the party grieved, the lord chancellor shall make him out letters of marque under the great seal; and by virtue of these he may attack and seize the property of the aggressor nation, without hazard of being condemned as a robber or pirate.

MARQUESAS ISLANDS, the name of certain islands in the South Sea, lying between eight and ten degrees of south latitude, and between 139 and 140 degrees of west longitude. They are five in number, viz. La Magdalena, St Pedro, La Dominica, Santa Christina, and Hood Island. All the natives of their islands may be supposed to be of the same tribe. Those spots that are fit for culture are very populous; but as every island is very mountainous, and has many inaccessible and barren rocks, it is to be doubted whether the whole population of this group amounts to 50,000 persons. The Spaniards, who first visited here, found the manners of this people gentle and inoffensive; but these qualities did not prevent those who landed from wantonly butchering several of the natives at Magdalena.

The inhabitants of these islands collectively, says captain Cook, are, without exception, the finest race of people in the South-Sea. For symmetry of shape, and regular features, they perhaps surpass all other nations. Not a single deformed or ill-proportioned person was seen on the island; all were strong, tall, well-limbed, and remarkably active. The men are about  
five

Marpurg  
Marquesas.

five feet ten or six inches high; their teeth are not so good, nor are their eyes so full and lively, as those of many other nations: their hair is of many colours, but none red; some have it long, but the most general custom is to wear it short, except a bunch on each side the crown, which they tie in a knot: their countenances are pleasing, open, and full of vivacity: they are of a tawny complexion, which is rendered almost black by punctures over the whole body. They were entirely naked, except a small piece of cloth round their waist and loins. The punctures were disposed with the utmost regularity, so that the marks on each leg, arm, and cheek, were exactly similar. The women, in two days time, began to appear in considerable numbers, and the sailors found them not less kind than those of the other islands which they had visited: they were inferior to the men in stature, but well proportioned; their general colour was brown; no punctures were observed upon them; they wore a single piece of cloth made of the mulberry bark, which covered them from the shoulders to the knees.

The principal head-dress used in the islands, and what appear to be their chief ornament, is a sort of broad fillet, curiously made of the fibres of the husks of cocoa-nuts; in the front is fixed a mother-of-pearl shell, wrought round to the size of a tea-saucer; before that another smaller, of very fine tortoise-shell, perforated into curious figures; also before, and in the centre of that, is another round piece of mother-of-pearl, about the size of half a crown; and before this another piece of perforated tortoise-shell, the size of a shilling. Besides this decoration in front, some have it also on each side, but in small pieces; and all have fixed to them the tail-feathers of cocks, or tropic-birds, which when the fillet is tied on stand upright, so that the whole together makes a very sprightly ornament. They wear round the neck a kind of ruff, or necklace, made of light wood, the outward and upper sides covered with small peas, which are fixed on with gum; they also wear some bunches of human hair fastened to a string, and tied round the legs and arms. But all the above ornaments are seldom seen on the same person. All these ornaments, except the last, they freely parted with for a trifling consideration; but the human hair they valued very highly, though these bunches were the usual residence of many vermin. It is probable, that these were worn in remembrance of their deceased relations, and therefore were looked upon with some veneration; or they may be the spoils of their enemies, worn as the honourable testimonies of victory. However, a large nail, or something which struck their eyes, commonly got the better of their scruples. The king, or chief of the island, came to visit captain Cook; he was the only one seen completely dressed in this manner. Their ordinary ornaments are necklaces, and amulets made of shells, &c. All of them had their ears pierced, though none were seen with ear-rings. The king had not much respect paid him by his attendants: he presented captain Cook with some fruit and hogs; and acquainted him that his name was *Honoa*, and that he was *he-ka-ai*, which title seems to correspond with the *aree* of O-Taheitee, and *areke* of the Friendly Isles. Their dwellings are in the valleys, and on the sides of the hills near their plantations. They are built in the same manner as those

at O-Taheitee, which will be particularly described when we speak of that island; but they are much meaner, and are only covered with the leaves of the bread-fruit tree: in general, they are built on a square or oblong pavement of stone, raised some height above the level of the ground; they likewise have such pavement near their houses, on which they sit to eat and amuse themselves. Along the uppermost edge of the mountain a row of stakes, or pallisades closely connected together, were seen like a fortification, in which, by the help of glasses, appeared something like huts, which seemed to bear a great resemblance to the hip-pas of New-Zealand, which will be described in speaking of that country. Their canoes resemble those of O-Taheitee, but not so large; their heads had commonly some flat upright piece, on which the human face was coarsely carved; and their sails were made of mats, triangular in shape, and very broad at the top: the paddles which they used were of heavy, hard wood, short, but sharp-pointed, and with a knob at the upper end; they were from 10 to 20 feet long, and about 15 inches broad.

Their weapons were all made of the club-wood, or casuarina; and were either plain spears about 8 or 10 feet long, or clubs which commonly had a knob at one end. They have also slings with which they throw stones with great velocity, and to a great distance, but not with a good aim.

The language of these people is much nearer to that of O-Taheitee, than any other dialect in the South-Sea, except that they could not pronounce the letter *r*.

The only quadrupeds seen here were hogs, except rats; here were fowls, and several small birds in the woods, whose notes were very melodious. The chief difference between the inhabitants of the Marquesas and those of the Society-Islands, seems to consist in their different degrees of cleanliness: the former do not bathe two or three times a-day, nor wash their hands and face before and after every meal, as the latter do; and they are besides very slovenly in the manner of preparing their meals. Their diet is chiefly vegetable; though they have hogs and fowls, and catch abundance of fish at certain times. Their drink is pure water, cocoa-nuts being scarce here.

It was not long before the propensity of the natives was discovered to be, rather to receive than give; for when they had taken a nail as the price of a bread-fruit, the article so purchased could not be obtained from them. To remove this dishonest disposition, captain Cooke ordered a musket to be fired over their heads, which terrified them into fair-dealing.

Soon after the natives had gathered courage enough to venture on board the ship, one of them unfortunately stole an iron stanchion from the gang-way, with which he sprang into the sea, and, notwithstanding its weight, swam with it to his canoe, and was making to the shore with all speed. A musket was fired over his head to frighten him back, but to no effect, he still continued to make off with his booty; the whistling of another ball over his head was as ineffectual: an officer, less patient of such an injury than reason and humanity should have taught him to be, levelled a musket at the poor fellow, and shot him thro' the head. Captain Cook had given orders to fire over the

Marquetras, the canoe, but not to kill any one; he was in a boat, and came up with the canoe soon after. There were

Italians: it seems, however, to have arrived at its Marquetry. height in the 17th century, among the French.

Two men in her: one sat bailing out the blood and water in a kind of hysterical laugh; the other, a youth of about 14 or 15 years of age, who afterwards proved to be the son of the deceased, fixed his eyes on the dead body with a serious and dejected countenance. This act of severity, however, did not estrange the islanders to the ship, and a traffic was carried on to the satisfaction of both parties; bread-fruit, bananas, plantains, and some hogs, were given in exchange for small nails, knives, and pieces of Amsterdam cloth; red feathers of the Amsterdam-Island were greatly esteemed here. Captain Cook, accompanied with the gentlemen of the ship, in their walks about the country lit on the house which had been the habitation of the man who had been shot; there they found his son, who fled at their approach: they inquired for his female relations, and were told that they remained at the top of the mountain, to weep and mourn for the dead. Notwithstanding they were then among the relations of a man who had been killed by them, not the least tokens of animosity, or revenge, were discernible among the natives.

The weather being extremely hot, the inhabitants made use of large fans to cool themselves, of which great numbers were purchased; these fans were formed of a kind of tough bark, or grass, very firmly and curiously plaited, and frequently whitened with shell-lime. Some had large feathered leaves of a kind of palm, which answered the purpose of an umbrella.

The natives at length became so familiar as to mount the sides of the ship in great numbers. They frequently danced upon deck for the diversion of the sailors: their dances very much resembled those of O-Tahitee; their music too was very much the same.

A sailor having been inattentive to his duty, received several blows from captain Cook; on seeing which, the natives exclaimed, *tape-a hei-te tina*, "he beats his brother." From other instances that had occurred, it was clear that they knew the difference between the commander and his people, but at the same time they conceived them all brethren; and, says Mr Forster, "to me the most natural inference is, that they only applied an idea to us in this case, which really existed with regard to themselves; they probably look on themselves as one family, of which the eldest born is the chief or king."

**MARQUETRY, IN-LAID WORK**; a curious kind of work, composed of pieces of hard fine wood of different colours, fastened, in thin slices, on a ground, and sometimes enriched with other matters, as tortoise-shell, ivory, tin, and brass.

There is another kind of marquetry made, instead of wood, of glasses of various colours; and a third, where nothing but precious stones, and the richest marbles, are used: but these are more properly called *mosaic work*. See **MOSAIC**.

The art of inlaying is very ancient; and is supposed to have passed from the east to the west, as one of the spoils brought by the Romans from Asia. Indeed it was then but a simple thing; nor did it arrive at any tolerable perfection, till the 15th century, among the

Till John of Verona, a cotemporary with Raphael, the finest works of this kind were only black and white, which are what we now call *Moresco's*; but that religious, who had a genius for painting, stained his woods with dyes or boiled oils, which penetrated them. But he went no further than the representing buildings and perspectives, which require no great variety of colours. Those who succeeded him, not only improved on the invention of dyeing the woods, by a secret which they found of burning them without consuming, which served exceedingly well for the shadows; but had also the advantage of a number of fine new woods of naturally bright colours, by the discovery of America. With these assistances the art is now capable of imitating any thing; whence some call it the *art of painting in wood*.

The ground whereon the pieces are to be ranged and glued, is ordinarily of oak or fir well dried; and to prevent warping, is composed of several pieces glued together. The wood to be used, being reduced into leaves, of the thickness of a line, is either stained with some colour, or made black for shadow; which some effect by putting it in sand extremely heated over the fire, others by steeping it in lime-water and sublimate, and others in oil of sulphur.—Thus coloured, the contours of the piece are formed, according to the parts of the design they are to represent.

The last is the most difficult part of marquetry, and that wherein most patience and attention are required. The two chief instruments used herein are the saw and the vice; the one, to hold the matters to be formed; the other, to take off from the extremes, according to occasion. The vice is of wood, having one of its chaps fixed, the other moveable, and is opened and shut by the foot, by means of a cord fastened to a treadle. Its structure is very ingenious, yet simple enough.

The leaves to be formed (for there are frequently three or four of the same kind formed together) are put within the chaps of the vice, after being glued on the outermost part of the design whose profile they are to follow; then the workmen pressing the treadle, and thus holding fast the piece, with his saw runs over all the out-lines of the design.—By thus joining and forming three or four pieces together, they not only gain time, but the matter is likewise the better enabled to sustain the efforts of the saw; which, how delicate soever it may be, and how lightly soever the workman may conduct it, without such a precaution, would be apt to raise splinters, to the ruin of the beauty of the work.

When the work is to consist of one single kind of wood, or of tortoise-shell, on a copper or tin ground, or *vice versa*; they only form two leaves on one another, i. e. a leaf of metal, and a leaf of wood or shell: this they call *sawing in counter-parts*; for by filling the vacuities of one of the leaves by the pieces coming out of the other, the metal may serve as a ground to the wood, and the wood to the metal.

All the pieces thus formed with the saw, and marked to know them again, and the shadow given in the manner already mentioned; they vaneer or fasten each in its place on the common ground; using for that purpose

pose the best English glue.

The whole is put in a press to dry, planed over, and polished with the skin of the sea-dog, wax, and have-grafs, as in simple varnishing; with this difference, however, that in marquetry the fine branches, and several of the more delicate parts of the figures, are touched up and finished with a graver.

It is the cabinet-makers, joiners, and toy-men among us, who work in marquetry; it is the enamelers and stone-cutters, who deal in mosaic work: the instruments used in the former are mostly the same with those used by the ebonists.

MARQUIS, a title of honour, next in dignity to that of duke. His office is to guard the frontiers and limits of the kingdom, which were called the *marches*, from the Teutonic word *marche*, a limit: as, in particular, were the marches of Wales and Scotland, while they continued hostile to England. The persons who had command there, were called *lords marchers*, or *marquesses*; whose authority was abolished by statute 27 Hen. VIII. c. 27. though the title had long before been made a mere design of honour, Robert Vere earl of Oxford being created marquis of Dublin by Richard II. in the eighth year of his reign. A marquis is created by patent; his mantle is double ermine, three doublings and a half; his title is *most noble*; and his coronet has pearls and strawberry-leaves intermixed round, of equal height.

MARR, that part of Aberdeenshire situated between the rivers Dee and Don.

MARRIAGE, a contract, both civil and religious, between a man and a woman, by which they engage to live together in mutual love and friendship for the ends of procreation, &c. See MORAL PHILOSOPHY, n<sup>o</sup> 125, &c.

The first inhabitants of Greece lived together without marriage. Cecrops, king of Athens, was the first author of this honorable institution among that people. After the commonwealths of Greece were settled, marriage was very much encouraged by their laws; and the abstaining from it was discountenanced, and in many places punished. The Lacedæmonians were particularly remarkable for their severity towards those who deferred marrying, as well as to those who wholly abstained from it. The Athenians had an express law, that all commanders, orators, and persons entrusted with any public affair, should be married men. Polygamy, or the having more than one wife at a time, was not commonly tolerated in Greece. See POLYGAMY.

The time of marriage was not the same in all places; the particular number of years to which they were limited, depended upon the humour of each lawgiver, nothing being generally agreed on this matter.

The Greeks thought it scandalous to contract marriage within certain degrees of consanguinity; while most of the barbarous nations allowed incestuous mixtures. Most of the Grecian states required that citizens should match with none but citizens; and the children were not allowed to marry without the consent of their parents: when there were orphan-children without any inheritance, the next of kin was obliged to marry them, or to settle a portion on them according to his quality.

The Romans, as well as the Greeks, disallowed of

polygamy. A Roman might not marry any woman who was not a Roman. It was thought dishonourable for a woman to marry twice. Among the Romans, the kalends, nones, and ides, of each month were thought unlucky to be married in, as was also the feast of the parental, or ferialia, and the whole month of May was reckoned the most unhappy season.

We find but few laws in the books of Moses concerning the institution of marriage: he restrained the Israelites from marrying within certain degrees of consanguinity; but we find that polygamy, though not expressly allowed, is however tacitly implied in the laws of Moses: there is a particular law that obliged a man, whose brother died without issue, to marry his widow, and raise up children to his brother. The Hebrews purchased their wives, by paying down a competent dowry for them; and a man was at liberty to marry, not only in any of the 12 tribes, but even out of them, provided it was with such nations as used circumcision.

The ancient Christian church laid several restraints upon her members in relation to marriage; such was the rule forbidding Christians to marry with infidels and heathens: another restraint related to the consanguinity and affinity prohibited in Scripture: a third was, that children under age should not marry without the consent of their parents, guardians, or next relations: and another was, that there should be some party of condition between the contracting parties. They not only condemned polygamy, but even reckoned it unlawful to marry after a divorce. As to the season in which marriage might or might not be celebrated in the Christian church, all we find is, that it was forbidden in Lent. The Romish church requires of the clergy perpetual abstinence from marriage; and has advanced this institution to the dignity of a sacrament. The church of England, though she does not consider marriage as a sacrament, yet looks upon it as an institution so sacred, as that it ought always to be celebrated by an ecclesiastical person; but marriages, without this sanction, are not therefore null and void. There is no canon of this church, which forbids marriages to be solemnized at any time. The canonical hours for celebrating of matrimony, are from eight to twelve in the forenoon. The impediments to marriage are specified in canon 102 of the English church, and are these: 1. A preceding marriage or contract, or any controversy or suit depending on the same. 2. Consanguinity or affinity. 3. Want of consent of parents, or guardians, &c.

Marriage, according to our law, cannot be dissolved but by death, breach of faith, or other notorious misbehaviour. It is requisite to complete a marriage, that there be a free and mutual consent between the parties. The marriages performed by Romish priests, whose orders are acknowledged by the church of England, are deemed good in some instances; but they ought to be solemnized agreeable to the rites of our own church, to be intitled to the benefits attending on marriage here, such as dower, thirds, &c. A marriage in reputation, as among the quakers, is allowed to be sufficient to give title to a personal estate; though in the case of a person married by a dissenting minister, who was not in orders, it has been held, that where a husband demands a right due to him as such

**Marriage.** by the ecclesiastical law, he ought to prove himself a husband, thereby to be intitled to it; and yet this marriage is not altogether a nullity, because, by the laws of nature, the contract is binding. On a promise of marriage, if it be mutual on both sides, damages may be recovered in case either party refuses to marry; and though no time for the marriage be agreed on, if the plaintiff aver that he offered to marry the defendant, who refused it, an action is maintainable for the damages; but no action shall be brought upon any agreement, except it is in writing, and signed by the party to be charged.

For the better preventing clandestine marriages, and the inconveniences arising therefrom, an act of parliament was passed, wherein the following regulations were made, viz. That from and after March 25, 1754, banns of matrimony shall be published in the parish-church, or some public chapel belonging to the parish wherein the parties dwell, upon three Sundays before the marriage, during the time of service, immediately after the second lesson: and where the parties dwell in different parishes, the banns shall be published in both; and the marriage shall be solemnized in the church or chapel wherein the banns were published, and no-where else: and it is also required, that both or either of the parties to be married, do reside four weeks at least in the parish where the banns are published. Nothing in this act deprives the archbishop of Canterbury of his usual right of granting special licences to marry at any convenient time or place. All marriages solemnized contrary to the foregoing regulations, shall be void; and the person solemnizing the same, shall be adjudged guilty of felony, and be transported for 14 years to his majesty's colonies. Marriages solemnized by licence, where either of the parties (not being a widow or widower,) shall be under age, without the consent of the father first had (if living), or of the guardians or one of them, and, where there shall be no guardians, of the mother (if living and unmarried), or of the guardian appointed by chancery, shall be void to all intents and purposes. Where any such guardian shall be *non compos mentis*, or in parts beyond the sea, or shall refuse their consent to a proper match, the party may apply by petition to the lord-chancellor, lord-keeper, or lords commissioners of the great seal, who shall proceed on such a petition in a summary way; and where the marriage proposed shall appear to be proper, they shall judicially declare the same to be so by an order of court, which shall be deemed effectual. All marriages shall be solemnized in the presence of two or more creditable witnesses besides the minister; and an entry thereof shall be immediately made in a register kept for that purpose. This act shall not extend to the marriages of any of the royal family, nor to Scotland, nor to those persons called *quakers*, nor those professing the Jewish religion. See **LAW**, n° clx.

**Policy of encouraging MARRIAGE.** Dr Halley observes, that the growth and increase of mankind is not so much stunted by any thing in the nature of the species, as it is from the cautious difficulty most people make to adventure on the state of marriage, from the prospect of the trouble and charge of providing for a family: nor are the poorer sort of people herein to be blamed, who, besides themselves and families, are

obliged to work for the proprietors of the lands that feed them; and of such does the greater part of mankind consist. Were it not for the backwardness to marriage, there might be four times as many births as we find; for by computation from the table given under the article **MORTALITY**, there are 15,000 persons above 16 and under 45, of which at least 7000 are women capable of bearing children; yet there are only 1238, or little more than a sixth part of these, that breed yearly: whereas, were they all married, it is highly probable that four of six should bring forth a child every year, the political consequences of which are evident. Therefore, as the strength and glory of a kingdom or state consists in the multitude of subjects, celibacy above all things ought to be discouraged, as by extraordinary taxing or military service: and, on the contrary, those who have numerous families should be allowed certain privileges and immunities, like the *jus trium liberorum* among the Romans; and especially, by effectually providing for the subsistence of the poor.

**MARROW**, in anatomy, a soft oleaginous substance contained in the cavity of the bones. See **ANATOMY**, n° 5.

**MARRUBIUM**, WHITE HOREHOUND; a genus of the gymnospermia order, belonging to the didymia class of plants. There are nine species, the most remarkable of which is the vulgar, a native of Britain, growing naturally in waste places, and by way-sides near towns and villages, but not common. It has a strong and somewhat musky smell, and bitter taste. It is reputed attenuant and resolvent; an infusion of the leaves in water, sweetened with honey, is recommended in asthmatic and phtisical complaints, and most other diseases of the breast and lungs.

**MARS**, in astronomy. See there, n° 4. 22. 44. 151.

**MARS**, in Pagan worship, the god of war. He was, according to some, the son of Jupiter and Juno; while others say that he was the son of Juno alone, who, being displeased at Jupiter's having produced Minerva from his brain, in revenge conceived by touching a flower, and became the mother of this formidable deity. The amours of Mars and Venus, and the manner in which Vulcan caught and exposed them to the laughter of the other gods, have been described by several of the ancient poets. He is represented as having several wives and mistresses, and a considerable number of children. He was held in the highest veneration by the Romans, both from his being the father of Romulus their founder, and from their inclination to conquest; and had magnificent temples erected to him at Rome.

Mars is usually represented in a chariot, drawn by furious horses. He is completely armed; and extends his spear with the one hand, and grasps a sword, imbrued in blood, with the other. He has a fierce and savage aspect. Discord is represented preceding his car; and Clamour, Fear, and Terror, appear in his train. The victims sacrificed to him were the wolf, the horse, the wood-pecker, the vulture, and the cock.

**MARS**, among chemists, denotes *iron*; that metal being supposed to be under the influence of the planet Mars.

**MARSAL**, a town of France, in Lorraine, remarkable

Marſals  
||  
Marm.

markable for its ſalt-works; ſeated in a marſh on the river Selle, of difficult acceſs, which, together with the fortifications, render it an important place. E. Long. 6. 43. N. Lat. 48. 46.

MARSALA, an ancient and ſtrong town of Sicily, in the valley of Mazara. It is well peopled, and built on the ruins of the ancient Lilybæum. E. Long. 12. 37. N. Lat. 37. 52.

MARSAN, or MOUNT-MARSAN, a town of France, in Gaſcony, and capital of a ſmall territory of the ſame name, fertile in wine; ſeated on the river Midule, in W. Long. o. 39. N. Lat. 44. o.

MARSAQUIVER, or MARSAQUIVER, a ſtrong and ancient town of Africa, on the coaſt of Barbary, and in the province of Beni-Arax, in the kingdom of Tremefen, with one of the beſt harbours in Africa. It was taken by the Spaniards in 1732. It is ſeated on a rock near a bay of the ſea, in W. Long. o. 10. N. Lat. 35. 40.

MARSEILLES, a ſtrong ſea-port town, and the moſt rich and trading place of Provence, in France. Here is a good harbour, where the French galleys are ſtationed; for it will not admit large men of war. It is divided into the Old Town and the New: in the Old, the houſes are not ſo well built as in the other. They are ſeparated by a ſtreet, bordered by trees on each ſide. It is ſaid to contain 100,000 inhabitants. It is one of the moſt trading towns in France, to which its harbour contributes, which has a chain acroſs its mouth. Without the walls is the caſtle of Notre-Dame, which is very well fortified. It is a biſhop's ſee, and there is a French academy, it having been noted at all times for men of learning. In 1660, Lewis XIV. built the citadel and fort St John to keep the inhabitants in awe, becauſe they pretended to be free. The Jeſuits had a very fine obſervatory here; and in the arſenal, built not long ago, there are arms for 40,000 men. In the Houſe of Diſcipline they weave gold, ſilver, and ſilk brocades. They reckon 2000 country-houſes round Marseilles, where the inhabitants go in ſummer to take the air. The public buildings are very handſome; and the fineſt drugs are brought thither from all parts of the world. It is ſeated on the north ſhore of the Mediterranean, in E. Long. 4. 27. N. Lat. 43. 18.

MARSH (Narciffus), an exemplary Iriſh prelate, born at Hannington in Wiltſhire in 1638. He was made principal of St Alban's hall, Oxford, in 1673, but removed to the provoſhip of Dublin college in 1678. He was promoted to the biſhopric of Leighlin and Ferns in 1682, tranſlated to the archbiſhopric of Caſhel in 1690, to Dublin in 1694, and to Armagh in 1703. While he held the ſee of Dublin, he built a noble library for the uſe of the public, filled it with choice books, and ſettled a proviſion for two librarians. He repaired, at his own expence, ſeveral decayed churches, beſides buying in and reſtoring many impropriations, and preſenting a great number of oriental MSS. to the Bodleian library. He was a very learned and accomplished man; was well verſed in ſacred and prophane literature, in mathematics, natural philoſophy, the learned languages, eſpecially the oriental, and in both the theory and practice of muſic. He publiſhed, 1. *Inſtitutiones logicæ*. 2. *Manuſcriptio ad logicam*, written by Philip de

Trius; to which he added the Greek text of Ariſtotle, and ſome ſome tables and ſchemes. 3. An introductory eſſay on the doctrine of ſounds, &c. He died in 1713.

MARSH, ſignifies a piece of ground flow'd with water, yet ſo that the graſs and other vegetables riſe above the ſurface of the water, and, by their decaying, give riſe to putrid effluvia, which are very pernicious to the human body.

MARSHAL, in its primary ſignification, means an officer who has the command or care of horſes; but it is now applied to officers who have very different employments, as *earl-marshal*, *knight-marshal*, *marshal of the king's bouſe*, &c.

MARSHAL of the King's-bench, an officer who has the cuſtody of the King's-bench priſon in Southwark. This officer is obliged to give his attendance, and to take into his cuſtody all perſons committed by that court.

MARSHAL of the Exchequer, an officer to whom that court commits the king's debtors.

MARSHAL of the King's Hall, an officer who has the care of placing the houſhold ſervants and ſtrangers at table, according to their quality.

MARSHAL of Mareſchal of France, an officer of the greateſt dignity in the French armies. When two or more marſhals are in the army, the eldeſt commands.

MARSHAL (Thomas), a very learned Engliſh divine in the 17th century, was educated at Oxford. This city being garrifoned upon the breaking out of the civil wars, he bore arms for the king. Afterward he had ſeveral ſucceſſive preferments in the church; and died at Lincoln-college, of which he was rector. By his will he left all his books and MSS. to the univerſity of Oxford, and money to Lincoln-college for the maintenance of three ſcholars. He was a noted critic, eſpecially in the Gothic and Engliſh-Saxon tongues; and eminent for his piety and other valuable qualities. He wrote, 1. *Obſervationes in Evangeliorum verſiones per antiquos duos, Goth. ſcilicet & Anglo-Sax.* &c. 2. Notes on the church-catechiſm, &c.

MARSHALLING a Coat, in heraldry, is the diſpoſal of ſeveral coats of arms belonging to diſtinct families in one and the ſame ſcutocheon or ſhield, together with their ornaments, parts, and appurtenances. See HERALDRY, chap. vi. p. 3610.

MARSHALSEA (the Court of), and the Palace-court at Weſtmiſter, though two diſtinct courts, are frequently confounded together. The former was originally holden before the ſteward and marſhal of the king's houſe, and was inſtituted to adminiſter juſtice between the king's domeſtic ſervants, that they might not be drawn into other courts, and thereby the king loſe their ſervice. It was formerly held in, though not a part of, the *aula regiſ*; and, when that was ſubdivided, remained a diſtinct juriſdiction: holding plea of all treſpaſſes committed within the verge of the court, where only one of the parties is in the king's domeſtic ſervice, (in which caſe the inqueſt ſhall be taken by a jury of the country); and of all debts, contracts and covenants, where both of the contracting parties belong to the royal houſehold; and then the inqueſt ſhall be compoſed of men of the houſehold only. By the ſtatute of 13 Ric. II. ſ. 1.

Marſh  
||  
Marſhalſea

**MARSHALFEA** c. 3. (in affiance of the common law,) the verge of the court in this respect extends for 12 miles round the king's place of residence. And, as this tribunal was never subject to the jurisdiction of the chief justiciary, no writ of error lay from it (though a court of record) to the king's-bench, but only to parliament, till the statutes of 5 Edw. III. c. 2. and 10 Edw. III. ft. 2. c. 3. which allowed such writ of error before the king in his place. But this court being ambulatory, and obliged to follow the king in all his progresses, so that by the removal of the household, actions were frequently discontinued, and doubts having arisen as to the extent of its jurisdiction, king Charles I. in the sixth year of his reign, by his letters-patent erected a new court of record, called the *curia palatii*, or *palace-court*, to be held before the steward of the household and knight-marshal, and the steward of the court, or his deputy; with jurisdiction to hold plea of all manner of personal actions whatsoever, which shall arise between any parties within 12 miles of his majesty's palace at Whitehall. The court is now held once a week, together with the ancient court of marshalsea, in the borough of Southwark: and a writ of error lies from thence to the court of king's-bench. But if the cause is of any considerable consequence, it is usually removed on its first commencement, together with the custody of the defendant, either into the king's-bench or common-pleas by a writ of *habeas corpus cum causa*: and the inferior business of the court hath of late years been much reduced, by the new courts of conscience erected in the environs of London; in consideration of which the four counsel belonging to these courts had salaries granted them for their lives by the stat. 23 Geo. II. c. 27.

**MARSHAM** (Sir John), a very learned English writer in the 17th century. He studied the law in the Middle Temple, and was sworn one of the six clerks in the court of chancery in 1638. In the beginning of the civil wars he followed the king to Oxford; for which he was sequestered of his place by the parliament at Westminster, and plundered. After the declining of the king's affairs, he returned to London; compounded, among other royalists, for his real estate; and betook himself wholly to his studies and a retired life, the fruits of which were some excellent works. He wrote *Diatriba Chronologica*; *Chronicus Canon*, *Aegyptiacus*, *Ebraicus*, *Græcus*, &c. He died in 1685.

**MARSHMALLOW**, in botany. See **ALTHEA**.

**MARSICO NUOVO**, a small, rich, and handsome town of Italy, in the kingdom of Naples, and in the Hither Principato, with a bishop's see. It is seated at the foot of the Apennines, near the river Agri, in E. Long. 15. 49. N. Lat. 20. 42.

**MARSIGLI** (Lewis Ferdinand, count), an Italian famous for letters as well as arms, was descended from an ancient and noble family, and born at Bologna in 1658. He acquired a great knowledge in the art of war and fortification; served under the emperor Leopold II. against the Turks, by whom he was taken prisoner in 1683, but redeemed after a year's captivity. In the Spanish succession war, Marsigli, then advanced to the rank of marshal, being in the fortress of Brissac, which surrendered to the duke of Burgundy in 1703, when the place was deemed

capable of holding out much longer; the count d'Arco who commanded was beheaded, and Marsigli, stripped of all his commissions, had his sword broke over him. He now fought for consolation in the sciences; as, amidst all the hurry and fatigue of war, he had made all the advantages the most philosophic man could do, who had travelled purely in quest of knowledge. He had a rich collection of every thing proper to the advancement of natural knowledge, instruments astronomical and chemical, plans of fortification, models of machines, &c. all which he presented to the senate of Bologna by an authentic act in 1712, forming at the same time out of them what he called the *institute of the arts and sciences at Bologna*. He also founded a printing-house, and furnished it with the best types for Latin, Greek, Hebrew, and Arabic, which he presented in 1728 to the Dominicans at Bologna, on condition of their printing all the writings of the *institute* at prime cost: this was called the *printing-house of St Thomas Aquinas*. His writings on philosophical subjects are numerous and valuable, in Latin, Italian, and French: he died in 1730.

**MARSTON** (John), an English dramatic writer, who lived in the time of James I. Wood says he was a student in Corpus Christi college, Oxford; but we neither know his family, nor the time of his birth. He contributed eight plays to the stage, which were all acted at Black-friars with applause; and one of them, called the *Dutch Courtezan*, was once revived since the Restoration, under the title of the *Revenge*, or a *Match in Newgate*. There is no account when he died; but we find his works were published after his death by Shakespeare, and may thence reasonably conclude that it happened about the year 1614. He was a chaste and pure writer; avoiding all that obscenity, ribaldry, and scurrility, which too many of the play-wrights of that time, and indeed much more so in some periods since, have made the basis of their wit, to the great disgrace and scandal of the stage.

**MARSYAS**, in fabulous history, a Phrygian who excelled in playing on the flute. Arriving at Nysa, he presumed to dispute with Apollo the prize of music: but that god, singing to his lyre, was decreed the conqueror; when, being enraged at Marsyas's presumption, he had him tied to an oak, and dead alive. Apollo afterwards changed him into a river of Phrygia, which was therefore called by his name. See **APOLLO**.

**MART**, a great fair held every year for buying and selling goods. Public marts, or places of buying and selling, such as markets and fairs, with the tolls thereunto belonging, can only be set up by virtue of the king's grant, or by long and immemorial usage and prescription, which presupposes such a grant. The limitation of these public resorts, to such time and place as may be most convenient for the neighbourhood, forms a part of œconomics, or domestic polity; which, considering the kingdom as a large family, and the king as the master of it, he has clearly a right to dispose and order as he pleases.

**MARTABAN**, a province of Asia in the kingdom of Pegu, lying in the gulph of Bengal. It is a country that produces rice and all kinds of fruits proper to the climate. It has mines of several sorts of metals,

Martha  
||  
Martialis.

tals, and carries on a great trade. The chief town, which is of the same name, is rich, handsome, and very populous, with a good harbour. E. Long. 97. 50. N. Lat. 15. 35.

MARTHA (St.), a province of South America, on the coast of Terra Firma, bounded on the north by the North Sea, on the east by Rio de la Hache, on the south by New-Granada, and on the west by Carthagena. It is 300 miles in length and 200 in breadth, is a mountainous country, and the land very high. Here begins the famous ridge of mountains called the *Cordilleras des los Andes*, which run from north to south the whole length of the continent of South America. It is extremely hot on the sea-coast; but cold in the internal parts, on account of the mountains. It abounds with the fruits proper to the climate; and there are mines of gold and precious stones, as also salt-works. The Spaniards possess but one part of this province, in which they have built Martha the capital. The air about the town is wholesome; and is seated near the sea, having a harbour surrounded with high mountains. It was formerly very considerable when the galleons were sent thither, but is now come almost to nothing. W. Long. 74. 11. N. Lat. 11. 20.

MARTHA (St.) or *Sierra Nevada*, a very high mountain in New Spain. Some say it is 100 miles in circumference at the bottom, and five miles in height. The top is always covered with snow in the hottest weather; and the French affirm, that they can perceive it from the island of St Domingo, which is 370 miles distant. W. Long. 74. 35. N. Lat. 8. 0.

MARTHA's Vineyard, an island of North America near the coast of New-England, 80 miles south of Boston. The inhabitants apply themselves chiefly to their fisheries, in which they have great success. W. Long. 70. 35. N. Lat. 41. 0.

MARTIAL LAW, is the law of war that depends upon the just but arbitrary will and pleasure of the king, or his lieutenant: for though the king doth not make any laws but by common consent in parliament, yet, in time of war, by reason of the necessity of it to guard against dangers that often arise, he useth absolute power, so that his word is a law. *Smith de Repub. Angl. lib. 2. c. 4.*

But the martial law, (according to Chief Justice Hale), is in reality not a law; but something indulged rather than allowed as a law; and it relates only to members of the army, being never intended to be executed on others, who ought to be ordered and governed by the laws to which they are subject, tho' it be a time of war. And the exercise of martial law, whereby any person might lose his life, or member, or liberty, may not be permitted in time of peace, when the king's courts are open for all persons to receive justice.

MARTIALIS (Marcus Valerius), a famous Latin poet, born at Bilbilis, now called *Bubiera*, in the kingdom of Arragon in Spain, was of the order of knights. He went to Rome at the age of 21, and staid there 35 years, under the reign of Galba and the succeeding emperors, till that of Trajan; and having acquired the esteem of Titus and Domitian, he was created tribune. At length, finding that he was neglected by Trajan, he returned to his own country

Bilbilis, where he married a wife, and had the happiness to live with her several years. He admires and commends her much, telling her that she alone was sufficient to supply the want of every thing he enjoyed at Rome. "*Romam tu mihi sola facis*," says he, in the 21st epigram of the 12th book. She appears likewise to have been a lady of a very large fortune; for, in the 31st epigram of the same book, he extols the magnificence of the house and gardens he had received from her, and says that she had made him a little kind of monarch."

*Munera sunt domino: post septima lustra reverso,  
Hæc Marcella domos, parvaque regna deit.*

There are still extant 14 books of his epigrams, filled with points, a play upon words, and obscenities. The style is affected. However, some of his epigrams are excellent; many of them are of the middling kind; but the greatest part of them are bad: so that Martial never spoke a greater truth, than when he said of his own works,

*Sunt bona, sunt quædam mediocra, sunt mala plura.*

There is also attributed to him a book on the spectacles of the amphitheatre; but the most learned critics think that this last work was not written by Martial. The best editions of Martial are, that in *Usum Delphini*, 4to, Paris, 1617, and that *cum Notis Variorum*.

MARTIGUES, a sea-port town of France, in Provence, with the title of a principality; seated near a lake 12 miles long and five broad, which is navigable throughout, and from whence they get excellent salt. E. Long. 4. 20. N. Lat. 43. 28.

MARTIN (St.), a small but strong town of France, in the isle of Rhé, with a harbour and a strong citadel, fortified after the manner of Vauban. The island lies near the coast of Poitou. W. Long. 1. 0. N. Lat. 45. 40.

Cape MARTIN, a promontory of Valencia in Spain, near a town called *Denia*, and separates the gulph of Valencia from that of Alicante.

MARTIN (St.), an island of America, and one of the Caribbees, lying on the gulph of Mexico, to the north-west of St Bartholomew, and to the south-west of Anguilla. It is 42 miles in circumference; has neither harbour nor river, but several salt-pits. After various revolutions, it is at length in possession of the French and Dutch, who possess it conjointly. W. Long. 62. 35. N. Lat. 18. 15.

MARTIN, in zoology. See *HIRUNDO* and *MUSTELA*.

*Free MARTIN.* See *HERMATHRODITE*.

MARTINGALE, in the manege, a thong of leather, fastened to one end of the girths under a horse's belly, and at the other end to the muffs-roll, to keep him from rearing.

MARTINICO, the chief of the French Caribbee-islands, the middle of which is situated in W. Long. 61. 0. N. Lat. 14. 30.

This island was first settled by M. Desnambuc a Frenchman, in the year 1635, with only 100 men from St Christophers. He chose rather to have it peopled from thence than from Europe; as he foresaw, that men, tired with the fatigue of such a long voyage, would mostly perish soon after their arrival, either from the

Martigue  
||  
Martinico.

Martinico. the climate, or from the hardships incident to most emigrations. They completed their first settlement without any difficulty. The natives, intimidated by their fire-arms, or seduced by promises, gave up the western and southern parts of the island to the new comers. In a short time, however, perceiving the number of these enterprising strangers daily increasing, they resolved to extirpate them, and therefore called in the savages of the neighbouring islands to assist them. They fell jointly upon a little fort that had been hastily erected; but were repulsed, with the loss of 700 or 800 of their best warriors, who were left dead upon the spot.

After this check, the savages for a long time disappeared entirely; but at last they returned, bringing with them presents to the French, and making excuses for what had happened. They were received in a friendly manner, and the reconciliation sealed with pots of brandy. This peaceable state of affairs, however, was of no long continuance; the French took such undue advantages of their superiority over the savages, that they soon rekindled in the others that hatred which had never been entirely subdued. The savages, whose manner of life requires a vast extent of land, finding themselves daily more and more straitened, had recourse to stratagem, in order to destroy their enemies. They separated into small bands, and way-laid the French as they came singly out into the woods to hunt, and, waiting till the sportsman had discharged his piece, rushed upon and killed him before he could discharge it again. Twenty men had been thus assassinated before any reason could be given for their sudden disappearance: but as soon as the matter was known, the French took a severe and fatal revenge; the savages were pursued and massacred, with their wives and children, and the few that escaped were driven out of Martinico, to which they never returned.

The French being thus left sole masters of the island, lived quietly on those spots which best suited their inclinations. At this time, they were divided into two classes. The first consisted of those who had paid their passage to the island, and these were called *inhabitants*; and to these the government distributed lands, which became their own, upon paying a yearly tribute. These inhabitants had under their command a multitude of disorderly people brought over from Europe at their expence, whom they called *engagés*, or bondsmen. This engagement was a kind of slavery for the term of three years; on the expiration of which they were at liberty, and became the equals of those whom they had served. They all confined themselves at first to the culture of tobacco and cotton; to which was soon added that of arnotto and indigo. The culture of sugar also was begun about the year 1650. Ten years after, one Benjamin D'Acosta, a Jew, planted some cocoa trees; but his example was not followed till 1684, when chocolate was more commonly used in France. Cocoa then became the principal support of the colonists, who had not a sufficient fund to undertake sugar-plantations; but by the inclemency of the season in 1718, all the cocoa trees were destroyed at once.—Coffee was then proposed as a proper object of culture. The French ministry had received as a present from the Dutch, two of these

trees, which were carefully preserved in the king's botanical garden. Two young shoots were taken from these, put on board a ship for Martinico, and entrusted to the care of one Mr Desfieux. The ship happened to be straitened for want of fresh water; and the trees would have perished, had not the gentleman shared with them that quantity of water which was allowed for his own drinking. The culture of coffee was then begun, and attended with the greatest and most rapid success. About the end of last century, however, the colony had made but small advances. In 1700, it had only 6597 white inhabitants. The savages, mulattoes, and free negroes, men, women, and children, amounted to no more than 507. The number of slaves was but 14,566. All these together made a population of 21,645 persons. The whole of the cattle amounted to 3668 horses or mules, and 9217 head of horned cattle. The island produced a great quantity of cocoa, tobacco, and cotton; had nine indigo-houses, and 183 small sugar plantations.

After the peace of Utrecht, Martinico began to emerge from that feeble state in which it had so long continued. The island then became the mart for all the windward French settlements. In the ports of it the neighbouring islands sold their produce, and bought the commodities of the mother-country; and, in short, Martinico became famous all over Europe. In 1736, there were on the island 447 sugar-works; 11,953,232 coffee-trees, 193,870 of cocoa; 2,068,480 plants of cotton, 39,400 of tobacco, 6,750 of arnotto. The supplies for provision consisted of 4,806,142 banana trees; 34,483,000 trenches of cassava; and 247 plots of potatoes and yams. The number of blacks amounted to 72,000; men, women, and children. Their labour had improved the plantations as far as was consistent with the consumption then made in Europe of American productions; and the annual exports from the island amounted to about 700,000 l.

The connections of Martinico with the other islands entitled her to the profits of commission, and the charges of transport; as the alone was in the possession of carriages. This profit might be rated at the tenth of the produce; and the sum total must have amounted to near 765,000 l. This standing debt was seldom called in, and left for the improvement of their plantations. It was increased by advances in money, slaves, and other necessary articles; so that Martinico became daily more and more a creditor to the other islands, and thus kept them in constant dependence; while they all enriched themselves by her assistance.

The connections of this island with Cape Breton, Canada, and Louisiana, procured a market for the ordinary sugars, the inferior coffee, the molasses, and rum, which would not sell in France. In exchange the inhabitants received salt-fish, dried vegetables, deals, and some flour. In the clandestine trade on the coasts of Spanish America, consisting wholly of goods manufactured by the nation, she commonly made a profit of 90 per cent, on the value of about 175,000 l. sent yearly to the caracas, or neighbouring colonies.

So many prosperous engagements brought immense sums into Martinico. Upwards of 787,000 l. were constantly circulated in that island with great rapidity; and this is perhaps the only country in the world, where

Martinico.

where the specie has been so considerable as to make it a matter of indifference to them whether they dealt in gold, silver, or commodities. This extensive trade brought into the ports of Martinico annually 200 ships from France; 14 or 15 fitted out by the mother-country for the coast of Guinea, 60 from Canada, 10 or 12 from the islands of Margareta and Trinidad; besides the English and Dutch ships that came to carry on a smuggling trade. The private navigation from the island to the northern colonies, to the Spanish continent, and to the windward islands, employed 130 vessels from 20 to 30 tons burden.

The war of 1744 put a stop to this prosperity. Not that the fault was in Martinico itself; its navy, constantly exercised, and accustomed to frequent engagements, which the carrying on a contraband-trade required, was prepared for action. In less than six months, 40 privateers, fitted out at St Peter's, spread themselves about the latitude of the Caribbee islands. They signalled themselves in a manner worthy of the ancient freebooters; returning constantly in triumph, and laden with an immense booty. Yet, in the midst of these successes, an entire stop was put to the navigation of the colony, both to the Spanish coast, and to Canada, and they were constantly disturbed even on their own coasts. The few ships that came from France, in order to compensate the hazards they were exposed to by the loss of their commodities, sold them at a very advanced price, and bought them at a very low one. By this means the produce decreased in value, the lands were ill cultivated, the works neglected, and the slaves perishing for want.

When every thing thus seemed tending to decay, the peace at last restored the freedom of trade, and with it the hopes of recovering the ancient prosperity of the island. The event, however, did not answer the pains that were taken to attain it. Two years had not elapsed after the cessation of hostilities, when the colony lost the contraband-trade she carried on with the American Spaniards. This was owing to the substitution of register-ships to the fleets; and thus were the attempts of the smugglers confined within very narrow bounds. In the new system, the number of ships was undetermined, and the time of their arrival uncertain: which occasioned a variation in the price of commodities unknown before; and from that time the smuggler, who only engaged in this trade from the certainty of a fixed and constant profit, would no longer pursue it, when it did not secure him an equivalent to the risks he ran. But this loss was not so sensibly felt by the colony, as the hardships brought upon them by the mother-country. An unskilful administration clogged the reciprocal and necessary connection between the Islands and North-America with so many formalities, that in 1755 Martinico sent but four vessels to Canada. The direction of the colonies, now committed to the care of ignorant and avaricious clerks, soon lost its importance, sunk into contempt, and was prostituted to venality. The debts which had been contracted, during a series of calamities, had not yet been paid off, when the war broke out afresh. After a series of misfortunes and defeats, the island fell into the hands of the British. It was restored, however, in July 1763, 16 months after it had been conquered; but deprived of all the necessary means of pro-

Martinico.

sperty, that had made it of so much importance. For some years past, the contraband-trade carried on to the Spanish coasts was almost entirely lost. The cession of Canada had precluded all hopes of opening again a communication, which had only been interrupted by temporary mistakes. The productions of the Grenades, St Vincent, and Dominica, which were now become British dominions, could no longer be brought into their harbours; and a new regulation of the mother-country, which forbade her having any intercourse with Guadalupe, left her no hopes from that quarter.

The colony, thus deprived of every thing, as it were, and destitute, nevertheless contained, at the last survey, which was taken on the first of January 1770, in the compass of 28 parishes, 12,450 white people of all ages and of both sexes; 1814 free blacks or mulattoes; 70,553 slaves, and 443 fugitive negroes. The number of births in 1766, was in the proportion of one in 30 among the white people, and of one in 25 among the blacks. From this observation, if it were constant, it should seem that the climate of America is much more favourable to the propagation of the Africans than of the Europeans; since the former multiply still more in the labours and hardships of slavery, than the latter in the midst of plenty and freedom. The consequence must be, that in process of time the increase of blacks in America will surpass that of the white men; and, perhaps, at last avenge this race of victims on the descendants of the oppressors.

The cattle of the colony consists of 8283 horses or mules; 12,376 head of horned cattle; 975 hogs; and 13,544 sheep or goats.

Their provisions are, 17,930,596 trenches of cassava; 3,509,048 banana-trees; and 406 squares and a half of yams and potatoes.

Their plantations contain 1,444 squares of land, planted with sugar; 6,638,957 coffee-trees; 871,043 cocoa-trees; 1,764,807 cotton plants; 59,966 trees of cassia, and 61 of arnotto.

The meadows or savannahs take up 10,072 squares of land; there are 11,966 in wood, and 8448 uncultivated or forsaken.

The plantations which produce coffee, cotton, cocoa, and other things of less importance, are 1515 in number. There are but 286 for sugar. They employ 116 water-mills, 12 wind-mills, and 184 turned by oxen. Before the hurricane of the 13th of August 1766, there were 302 small habitations and 15 sugar-works more.

In 1769, France imported from Martinico, upon 202 trading vessels, 177,116 quintals of fine sugar, and 12,579 quintals of raw sugar; 68,518 quintals of coffee; 11,731 quintals of cocoa; 6048 quintals of cotton; 2518 quintals of cassia; 783 casks of rum; 307 hogheads of molasses; 150 pounds of indigo; 2147 pounds of preserved fruits; 47 pounds of chocolate; 282 pounds of rasped tobacco; 494 pounds of rope-yarn; 234 chests of liqueurs; 234 hogheads of molasses, &c. 451 quintals of wood for dyeing; and 12,108 hides in the hair. All these productions together have been bought in the colony itself, for 536,631. 9s. 10d. It is true, that the colony has received from the mother-country to the amount of 588,412. 16s. 6d. of merchandize; but part of

this

Martínico. this has been sent away to the Spanish coasts, and another part has been conveyed to the English settlements.

The island is 16 leagues in length and 45 in circumference, leaving out the capes, some of which extend two or three leagues into the sea: It is very uneven, and intersected in all parts by a number of hillocks; which are mostly of a conical form. Three mountains rise above these smaller eminences. The highest bears the indelible marks of a volcano. The woods with which it is covered, continually attract the clouds, which occasions noxious damps, and contributes to make it horrid and inaccessible; while the two others are in moist parts cultivated. From these mountains issue the many springs that water the island. These waters which flow in gentle streams, are changed into torrents on the slightest storm. Their qualities are derived from the soil over which they flow. In some places they are excellent, in others so bad, that the inhabitants are obliged to drink the water they have collected during the rainy sea.

Of all the French settlements in the West Indies, Martínico is the most happily situated with regard to the winds which prevail in those seas. Its harbours possess the inestimable advantage of affording a certain shelter from the hurricanes which annoy these latitudes. The harbour of Fort Royal, is one of the best in all the windward islands; and so celebrated for its safety, that, when it was open to the Dutch, their shipmasters had orders from the republic to take shelter there in June, July, and August, the three months in which the hurricanes are most frequent. The lands of the Lamentin, which are but a league distant, are the richest and most fertile in the whole island. The numerous streams which water this fruitful country, convey loaded canoes to considerable distance from the sea. The protection of the fortifications secured the peaceable enjoyment of so many advantages; which, however, were balanced by a swampy and unwholesome soil. This capital of Martínico was also the rendezvous of the men of war; which branch of the navy has always oppressed the merchantmen. On this account, Fort-Royal was an improper place to become the centre of trade, and was therefore removed to St Peter's. This little town, notwithstanding the fires that have four times reduced it to ashes, still contains 1700 houses. It is situated on the western coast of the island, on a bay, or inlet, which is almost circular. One part of it is built on the strand along the sea-side, which is called the *anchorage*; and is the place destined for ships and ware-houses. The other part of the town stands upon a low hill: it is called the *Fort*, from a small fortification that was built there in 1665, to check the seditions of the inhabitants against the tyranny of monopoly; but it now serves to protect the road from foreign enemies. These two parts of the town are separated by a rivulet.

The anchorage is at the back of a pretty high and steep hill. Shut up as it were by this hill, which intercepts the easterly winds, the most constant and most salubrious in these parts; exposed, without any refreshing breezes, to the scorching beams of the sun, reflected from the hill, from the sea, and the black sand on the beach; this place is extremely hot, and always unwholesome. Besides, there is no harbour; and the

ships which cannot winter safely upon this coast are obliged to take shelter at Fort-Royal. But these disadvantages are compensated by the convenience of the road of St Peter's, for loading and unloading of goods; and by its situation, which is such that ships can freely go in and out at all times and with all winds.

MARTLETS, in heraldry, little birds represented without feet; and used as a difference or mark of distinction for younger brothers, to put them in mind that they are to trust to the wings of virtue and merit, in order to raise themselves, and not to their feet, they having little land to set their foot on. See HERALDRY, Art. 2. p. 3585.

MARTYNIA, in botany, a genus of the angiospermia order, belonging to the didynamia class of plants. There are two species; both of them tender, herbaceous, flowery plants of South America; one of them an annual, the other a perennial, rising with erect stalks, from a foot, to two feet high, garnished with oblong simple leaves, and terminated by short spikes of large monopetalous, bell-shaped flowers, of blue and purple colours. They flower in July and August, and are very ornamental, but require always to be kept in the hottest part of the stove.

MARTYR, is one who lays down his life, or suffers death, for the sake of his religion. The word is Greek, *μαρτυρ*, and properly signifies a "witness." It is applied, by way of eminence, to those who suffer in witness of the truth of the gospel.

The Christian church has abounded in martyrs, and history is filled with surprising accounts of their singular constancy and fortitude under the cruellest torments human nature was capable of suffering. The primitive Christians were accused by their enemies of paying a sort of divine worship to the martyrs. Of this we have an instance in the answer of the church of Smyrna to the suggestion of the Jews, who, at the martyrdom of Polycarp, desired the heathen judge not to suffer the Christians to carry off his body, lest they should leave their crucified master, and worship him in his stead. To which they answered, "We can neither forsake Christ, nor worship any other: for we worship him as the Son of God; but love the martyrs as the disciples and followers of the Lord, for the great affection they have shewn to their King and Master." A like answer was given at the martyrdom of Fructuosus in Spain. For when the judge asked Eulogius, his deacon, Whether he would not worship Fructuosus? as thinking, that, tho' he refused to worship the heathen idols, he might yet be inclined to worship a Christian martyr; Eulogius replied, "I do not worship Fructuosus, but him whom Fructuosus worships." The primitive Christians believed, that the martyrs enjoyed very singular privileges; that upon their death they were immediately admitted to the beatific vision, while other souls waited for the completion of their happiness till the day of judgment; and that God would grant chiefly to their prayers the hastening of his kingdom, and shortening the times of persecution.

The churches built over the graves of the martyrs, and called by their names, in order to preserve the memory of their sufferings, were distinguished by the title *martyrium confessorio*, or *memoria*.

The festivals of the martyrs are of very ancient date in the Christian church, and may be carried back at

Martyr  
Marvell.

Marvell,  
Mary.

least till the time of Polycarp, who suffered martyrdom about the year of Christ 168. On these days the Christians met at the graves of the martyrs, and offered prayers and thanksgivings to God for the examples they had afforded them: they celebrated the eucharist, and gave alms to the poor; which, together with a panegyric oration or sermon, and reading the acts of the martyrs, were the spiritual exercises of these anniversaryes.

MARTYR (Peter), a famous divine, born at Florence in 1500. He studied philosophy and the tongues at Padua and Bononia, was a regular Augustine in the monastery of Fiscoli, and was counted one of the best preachers in Italy. Zuinglius and Bucer's writings gave him a good opinion of the Protestants, and his conversation with Valdes confirmed it. He preached that doctrine at Rome in private; but, being impeached, fled to Naples, and thence to Lucca, where he brought over to the Protestant interest Emanuel Tremellius, Celsus Martinengus, Paul Lascius, and Jeremiah Zanchy. He was sent for to England by king Edward VI. and made professor of divinity at Oxford in 1549. In queen Mary's reign he returned to Strasburg, and was present at the conference of Poissy. His sentiments were not the same with Calvin's about Christ's presence in the eucharist. He wrote a great number of works, and died in 1562.

MARTYROLOGY, in the church of Rome, is a catalogue or list of martyrs, including the history of their lives and sufferings for the sake of religion. The term comes from *μαρτυρ*, "witness," and *λογία*, "dico," or *λογία*, "colloquio."

The martyrologies draw their materials from the calendars of particular churches, in which the several festivals dedicated to them are marked; and which seem to be derived from the practice of the ancient Romans, who inserted the names of heroes and great men in their fasti, or public registers.

The martyrologies are very numerous, and contain many ridiculous and even contradictory narratives; which is easily accounted for, if we consider how many forged and spurious accounts of the lives of saints and martyrs appeared in the first ages of the church, which the legendary writers afterwards adopted without examining into the truth of them. However, some good good critics, of late years, have gone a great way towards clearing the lives of the saints and martyrs from the monstrous heap of fiction they laboured under. See the article *LEGEND*.

MARVELL (Andrew), an ingenious writer in the 17th century, was bred at Cambridge. He travelled thro' the most polite parts of Europe, and was secretary to the embassy at Constantinople. His first appearance in public business at home was as assistant to Mr John Milton Latin secretary to the protector. A little before the restoration, he was chosen by his native town, Kingston upon Hull, to sit in that parliament, which began at Westminster April 25th 1660; and is recorded as the last member of parliament who received the wages or allowance anciently paid to representatives by their constituents. He seldom spoke in parliament, but he had great influence without doors upon the members of both houses; and prince Rupert had always the greatest regard for his advice. He made himself very obnoxious to the government by his ac-

tions and writings; notwithstanding which, king Charles II. took great delight in his conversation, and tried all means to win him over to his side, but in vain; nothing being ever able to shake his resolution. There were many instances of his firmness in resisting the offers of the court; but he was proof against all temptations. The king having one night entertained him, sent the Lord treasurer Danby the next morning to find out his lodgings; which were then up two pair of stairs in one of the little courts in the Strand. He was busy writing, when the treasurer opened the door abruptly upon him. Surprised at the light of so unexpected a visitor, Mr Marvell told his Lordship, "That he believed he had mistaken his way." Lord Danby replied, "Not, now I have found Mr Marvell;" telling him he came from his Majesty, to know what he could do to serve him. Coming to a serious explanation, he told the Lord-treasurer, that he knew the nature of courts full well; that whoever is distinguished by a prince's favour, is certainly expected to vote in his interest. The Lord Danby told him, that his Majesty had only a just sense of his merits, in regard to which he only desired to know if there was any place at court he could be pleased with. These offers, though urged with the greatest earnestness, had no effect upon him. He told the Lord-treasurer, that he could not accept of them with honour; for he must be either ungrateful to the king in voting against him, or false to his country in giving into the measures of the court. The only favour therefore he had to request of his Majesty was, that he would esteem him as dutiful a subject as any he had, and more in his proper interest by refusing his offers, than if he had embraced them. The Lord Danby finding no arguments could prevail, told him, that the king had ordered a thousand pounds for him, which he hoped he would receive till he could think what farther to ask of his Majesty. The last offer was rejected with the same steadfastness of mind as the first; though, as soon as the Lord-treasurer was gone, he was forced to send to a friend to borrow a guinea. He died, not without strong suspicions of his being poisoned, in 1678, in the 58th year of his age. In 1688, the town of Kingston upon Hull contributed a sum of money to erect a monument over him in the church of St Giles in the Fields, where he was interred, and an epitaph composed by an able hand; but the minister of that church forbid both the inscription and monument to be placed there. He wrote many ingenious pieces; as, *The Rehearsal transposed*; A short historical Essay concerning General Councils, Creeds, and Impositions in matters of Religion, &c.

MARVEL of Peru, in botany. See *MIRABILIS*.

MARY I. of England, daughter of Henry VIII. by Catharine of Spain, queen and tyrant of England, succeeded her half-brother Edward VI. in 1553. If she had been educated in Spain, and an inquisitor had been her preceptor, she could not have imbibed more strongly the bloody principles of Romish persecution; and to the eternal disgrace of the English prelacy, though the reformation had taken root in both universities, she found English bishops ready to carry her cruel designs to subvert it, into effectual execution. Upon her accession to the throne, she declared, in her speech to the council, that she would not persecute her

Pro-

Mary.

Protestant subjects; but in the following month, she prohibited preaching without a special licence: before the expiration of three months, the Protestant bishops were excluded the house of lords, and all the statutes of Edward VI. respecting the Protestant religion were repealed; and before she had enjoyed the crown a year, archbishop Cranmer, who had saved her life when her father had resolved to take off her head, and the bishops Ridley and Latimer, were condemned for heresy at Oxford, and afterwards burnt. In 1556, the persecution became general; and Protestants of all ranks and ages, and of both sexes, fell victims to papal fury. It is observable, likewise, that the same perfidious violation of promises and treaties prevailed in the queen's council, with respect to public affairs. By the treaty of marriage concluded between the queen and Philip prince of Spain, son of the famous emperor Charles le Quint, in 1554, it was expressly stipulated, that England should not be engaged in any wars with France on account of Spain; yet in 1557, Philip, who had brought immense sums of money into England, procured an offensive and defensive alliance against France, from the English administration, and 8000 of the queen's choicest troops were sent over to the assistance of the Spaniards in the Low Countries: the loss of Calais to the French was the first fruit of this war; and some assert, that upon this single occasion the queen shewed a strong attachment to her native country, lamenting this stroke so deeply, that it occasioned her death; but it is better authenticated, that she was carried off by an epidemic fever, which raged so violently that it did not leave a sufficient number of men in health to get in the harvest. She died in 1558, in the 43d year of her age, and sixth of her reign.

MARY of Medicis, wife of Henry IV. king of France, was declared sole regent of the kingdom in 1610, during the convulsion which the assassination of that beloved king had occasioned. By her ambitious intrigues, the nation lost all its influence abroad, and was torn to pieces at home by contending factions. After several vicissitudes of fortune, she was abandoned by her son Lewis XIII. whose reign had been constantly disturbed by the civil commotions she had occasioned; and died in indigence at Brussels, in 1642, aged 68. She built the superb palace of Luxembourg at Paris, and embellished that city with aqueducts and other ornaments.

MARY, queen of Scotland, daughter of James V. was born in December 1542. Her father dying a few days after her birth, she scarce existed before she was hailed queen of Scotland. Violent were the disputes among the nobility, who should obtain the guardianship of her infant majesty, and government of the kingdom. It was however at length adjudged to the earl of Arran, as the heir-apparent and first peer of the realm. Whilst yet in her infancy, Henry VIII. of England demanded her in marriage for his son Ed-

ward; but her guardian refused his consent, and the famous battle of Muffelburgh was the consequence. The Scots being defeated, she was conveyed by the queen-mother to the Isle of Inchmahom: where, we are told, she was instructed in the Latin, French, Spanish, and Italian languages.

At six years old she was sent to France; where, after continuing a few days with the king and queen, she was removed to a monastery, and was there educated with the daughters of the French nobility. In this seminary she acquired a taste for poetry, and also became a notable proficient in music, dancing, and the art of sitting gracefully on horseback; but needle-work was her favourite amusement, in which she particularly excelled (A). On the 20th of April, 1558, she was married to the young dauphin; who dying in December 1560, she returned to her native country. She had not been long in Scotland, before she received proposals of marriage from Charles, archduke of Austria. Queen Elizabeth of England disapproved the match; and recommended Henry Stuart, Lord Darnley, son to the earl of Lenox. To this nobleman she gave her hand; and by him she had one son, James I. of England. They had not been many months married before Darnley was barbarously murdered; and, in three months after, the espoused earl of Bothwell, a man of no estimation, and who is generally supposed to have been the murderer of her late husband. From that fatal moment her life was a continued series of misfortunes: Scotland became a scene of confusion; her subjects rebelled; her husband fled to Denmark; and she herself was made a prisoner, and treated with the utmost indignity. She found means to escape from the persecution of her subjects, and fled to England for safety: but she was too beautiful to find a friend in Elizabeth; who, with constant professions of esteem, after keeping her in confinement during 18 long years, at last brought her head to the block.

The fair heroine received her sentence of death with great composure; wrote her will the day before her execution; for which, on the succeeding morn, she prepared with religious solemnity, and perfect resignation. She was executed on the 8th of February 1587, in the 46th year of her age, in the castle of Fotheringhay, where she had been long confined, and on the first of August was interred in the cathedral church at Peterborough, with great pomp. Twenty-five years after, her remains were, by order of her son king James I. removed to Henry VII.'s chapel in Westminster abbey, and a magnificent monument erected to her memory. See (History of) SCOTLAND.

She wrote, 1. Poems on various occasions, in the Latin, French, and Scotch languages. One of her poems is printed among those of A. Blackwood; another in Brantome's *Dames illustres*, written on the death of her first husband Francis. 2. Consolation of her long imprisonment, and royal advice to her son.

3. A

(A) An impalement of the arms of France and Scotland, embroidered under an imperial crown, on the valence of the canopy in the presence-chamber at Whitehall, is said to be chiefly her performance. *Sandf. Gen. Hist.* p. 529.

Embroidery probably made a considerable part of her employment during her tedious imprisonment, the last almost 20 years of her life; for one of her historians informs us, that about the year 1579, she sent, with other presents, to her son, a magnificent state-bed, "one of the most curious pieces of workmanship that that or any age has produced, embroidered with gold and silk, designed and finished all by her own hand." The principal figures, 29 in number, were emblematical, with Latin mottoes, alluding to her unhappy situation, and the separate arms of England, Scotland, and France. See *MacKenzie's Lives*, vol. iii. p. 328.

Mary.  
Maryland.

3. A copy of verses, in French, sent with a diamond-ring to queen Elizabeth. There is a translation of these verses among the Latin poems of Sir Thomas Chaloner. 4. Genuine Letters of Mary queen of Scots, to James earl of Bothwell; translated from the French, by E. Simmonds, 1726. There are, besides, many other of her epistles to queen Elizabeth, secretary Cecil, Mildmaye, &c. which are preserved in the Cotton, Ashmolean, and other libraries.

MARY II. queen of England, eldest daughter of James II. by his first wife, was born at St James's in 1662. She was bred up a Protestant, and married to the illustrious William Henry of Nassau, then prince of Orange, afterward king of England, in the 16th year of her age. She staid in Holland with her husband till February 12, 1689, when she came over, and was solemnly proclaimed queen of England, &c. She was an equal sharer with her royal husband in all the rights belonging to the crown; but the administration and execution thereof was lodged solely in the king. She was a princess endowed with the highest perfections both of body and mind: she loved history, as being proper to give her useful instructions; and was also a good judge as well as a lover of poetry. She studied more than could be imagined, and would have read more than she did, if the frequent returns of ill-humours in her eyes had not forced her to spare them. She gave her minutes of leisure to architecture and gardening; and since it employed many hands, she said, she hoped it would be forgiven her. She was the most gracious of sovereigns to her subjects, and the most obliging of wives to her husband, as well as the most excellent of mistresses to her servants: she ordered good books to be laid in the places of attendance, that persons might not be idle while they were in their turns of service. She was exceeding zealous for a reformation of manners; charitable in the highest degree, without the least ostentation. This excellent queen died on the 28th of December 1695, at Kensington, of the small-pox, in the 33d year of her age. In her arts lost a protectress, the unfortunate a mother, and the world a pattern of every virtue. As to her person, she was tall, of a majestic graceful mien, her countenance serene, her complexion ruddy, and her features beautiful.

MARY MAGDALEN'S DAY, a festival of the Romish church, observed on the 22d of July.

French MARYGOLD. See TAGETES.

MARYLAND, one of the British colonies in North America. It received that name in honour of Henrietta Maria the consort of king Charles I. who made a grant of this country, with very extraordinary powers, to Lord Baltimore. It lies between 38 and 40 degrees north latitude, and in longitude from 74 to 78 degrees west from London. It is in length about 140 miles, but not quite so much in breadth. It is bounded on the north by Pennsylvania; on the east by the lower counties of the same colony, and by the Atlantic; on the south by Chesapeake Bay; on the west by the river Potomack, and the province of Virginia. The climate may be well styled mild and pleasant: for though the winters are cold, they are short; and the heat of their summers is tempered by cool

breezes from the bay before-mentioned, which is one of the finest in the world. The country, except towards the north, is in general a flat open plain, of a deep rich soil, and very fertile. It produces grain of all sorts, rich fruits of different kinds, timber, hemp, flax, and in the bowels of the earth there is great plenty of iron ore. The staple of this country is tobacco, of which hitherto they have raised immense quantities, though some say their lands begin to wear out, which obliges them to keep great numbers of cattle for the sake of manure. They likewise export lumber, naval stores, &c. The situation of this country and the nature of its staple prevent the building of towns; for the plantations lying on the banks of their numerous navigable rivers, their vessels come up to the planter's doors, and their tobacco is consequently laden without trouble. Their custom-houses are on the rivers Pocomoke, Chester, Patuxint, and the north-side of Potomack. They have however one town, Annapolis, which is the seat of government, and tho' small is one of the fairest and best-built in America. The number of inhabitants exceeds 100,000; of which, however, three-fifths are negro-slaves; the remainder whites, who live in general much at their ease.

The patent which had been promised to Sir George Calvert of this part of what was then styled Virginia was granted to his son Cecilius, created lord Baltimore, and bears date 20th of June 1632. He sent over his brother Leonard Calvert, Esq; with 200 gentlemen and persons of some property to settle there. His son Charles Calvert was afterwards governor for near 20 years, and under their administration the colony flourished exceedingly. They made themselves so acceptable to the Indians at their first coming, that they yielded to them half, and as soon as their harvest was over their whole town; and this good understanding constantly subsisted. By means of a general toleration of all Christians, the number of inhabitants was much increased. The government, before the American revolt, was on much the same plan with the rest; for it behoved the deputy-governor, though appointed by the proprietor, to be approved of by the crown. He had a council and an assembly, but the laws made therein were not transmitted to England. The culture of tobacco made negroes necessary; this is of a particular kind called *oronomoko*, or as some write it *aranoko*, which is hotter than what is made in Virginia, and less acceptable here, but sells better in the eastern and northern parts of Europe. The inhabitants carry on a considerable trade to Great Britain, as well as to the southern parts of Europe, the French and British West Indies, and the continent of America. They have also some intercourse with the coasts of Africa. The total of their exports, A. D. 1769, amounted to 350,097 l. In A. D. 1770, there were entered inward ships 205, sloops 197; cleared outwards, ships 228, sloops 172.

MAS PLANTA, a plant which upon the same root produces male flowers only. See *MASCULUS Flor.*

MASAFUERO, an island of the South-Sea, lying in S. Lat. 33. 45. W. Long. 80. 46. It is very high and mountainous, and at a distance seems to consist of one hill or rock. It is of a triangular form, and seven or eight leagues in circumference. There is

Maryland  
Masafuero.

such

**Masculine.** such plenty of fish, that a boat with a few hooks and lines may very soon catch as many as will serve 100 people. Here are coal-fish, cavilliers, cod, hallibut, and cray-fish. Captain Carteret's crew caught a king-fisher that weighed 87 pounds, and was five feet and an half long. The sharks were here so ravenous, that,

in taking soundings, one of them swallowed the lead, by which they hauled him above water; but he regained his liberty, by disgorging his prey. Seals are so numerous here, that captain Carteret says, if many thousands were killed in a night, they would not be missed next morning. These animals yield excellent train-oil; and their hearts and plucks are very good food, having a taste something like those of a hog; their skins are covered with a very fine fur. There are many birds here, and some very large hawks. Of the pintado bird one ship caught 700 in one night. Commodore Byron landed here with difficulty in 1765, in order to take in wood and water, of both which he found plenty. He found also great numbers of goats, whose flesh tasted as well as venison in England.

**MASCU LINE**, something belonging to the male, or the stronger of the two sexes. See **MALE**.

**MASCU LINE**, is more ordinarily used in grammar to signify the first and worthiest of the genders of nouns. See **GENDER**.

The masculine gender is that which belongs to the male kind, or something analogous to it.

Most substantives are ranged under the heads of masculine or feminine.—This, in some cases, is done with a show of reason; but in others is merely arbitrary, and for that reason is found to vary according to the languages and even according to the words introduced from one language into another.—Thus the names of trees are generally feminine in Latin, and masculine in the French.

Farther, the genders of the same word are sometimes varied in the same language. Thus *alvus*, according to Priscian, was anciently masculine, but is now become feminine. And *navire*, a ship, in French, was anciently feminine, but is now masculine.

**MASCU LINE Rhyme**, in the French poetry, is that made with a word which has a strong, open, and accented pronunciation; as all words have, excepting those which have an *e* feminine in their last syllable. See **RHYME**.

For instance, *amour* and *jour*, *mort* and *fort*, are masculine rhymes:—and *pere* and *mere*, *gloire* and *memoire*, are feminine. Hence also verses ending with a masculine rhyme, are called *masculine verses*, and those ending with a feminine rhyme, *feminine verses*. See **VERSE**.

It is now a rule established among the French poets never to use the above two masculine or two feminine verses successively, except in the looser kind of poetry.

Marot was the first who introduced this mixture of masculine and feminine verses, and Ronfard was the first who practised it with success. The masculine verses should always have a syllable less than the feminine ones.

**MASCU LINE Signs**.—Astrologers divide the signs into masculine and feminine; by reason of their qualities, which are either active, and hot, or cold, accounted masculine; or passive, dry, and moist, which

are feminine.

On this principle they call the *sun*, *Jupiter*, *Saturn*, and *Mars*, masculine; and the moon and Venus, feminine. Mercury, they suppose, partakes of the two. Among the signs, Aries, Libra, Gemini, Leo, Sagittarius, Aquarius, are masculine: Cancer, Capricornus, Taurus, Virgo, Scorpio, and Pisces, are feminine.

**MASCU LUS FLOS**, a male flower; a flower which contains the stamina, reckoned by the sexualists the male organ of generation, but not the stigma or female organ.

All the plants of the class diœcia of Linnæus have male and female flowers upon different roots: those of the class monœcia, bear flowers of different sexes on the same root. The plants, therefore, of the former are only male or female: those of the latter are androgynous; that is, contain a mixture of both male and female flowers.

**MASH**, a drink given to a horse, made of half a peck of ground malt put into a pail, into which as much scalding hot water is poured as will wet it very well: when that is done, stir it about, till, by tasting, you find it as sweet as honey; and when it has stood till it is lukewarm, it is to be given to the horse. This liquor is only used after a purge, to make it work the better; or after hard labour, or instead of drink in the time of any great sickness.

**MASILLON** (John Baptist) bishop of Clermont, and one of the most eloquent preachers of his time, was born at Hieres, in Provence, in 1663, and died in 1742. His sermons and other works are published in 14 vols 12mo.

**MASINISSA**, king of a small territory in Africa, at first an enemy to the Romans, and ally of the Carthaginians: but Scipio having taken his nephew prisoner, sent him home, accompanied by an honourable escort, and laden with presents; which gave him so high an opinion of the generosity of the Romans, that he went over to them, and assisted them in their conquests in Africa. He was a renowned warrior, and left 44 children, most of whom became illustrious in history.

**MASON**, a person employed under the direction of an architect, in the raising of a stone-building.

The chief business of a mason is to make the mortar; raise the walls from the foundation to the top, with the necessary retreats and perpendiculars; to form the vaults, and employ the stones as delivered to him. When the stones are large, the business of hewing or cutting them belongs to the stone-cutters, tho' these are frequently confounded with masons: the ornaments of sculpture are performed by carvers in stones or sculptors. The tools or implements principally used by them are the square, level, plumb-line, bevel, compass, hammer, chisel, mallet, saw, trowel, &c. See **SQUARE**, &c.

Besides the common instruments used in the hand, they have likewise machines for raising of great burdens, and the conducting of large stones, the principal of which are the lever, pulley, wheel, crane, &c. See **LEVER**, &c.

*Free and Accepted MASONS*, a very ancient society or body of men; so called, either from some extraordinary knowledge of masonry or building, which they

Masculus  
♂  
Maslon.

**Masonry.** are supposed to be masons of, or because the first founders of the society were persons of that profession. These are now very considerable, both for number and character, being found in every country in Europe, and constituting principally of persons of merit and consideration. As to antiquity, they lay claim to a standing of some thousand years. What the end of their institution is, seems still in some measure a secret; and they are said to be admitted into the fraternity by being put in possession of a great number of secrets, called the *mason's word*, which have been religiously kept from age to age, being never divulged.

**MASONRY**, in general, a branch of architecture, consisting in the art of hewing or squaring stones, and cutting them level or perpendicular, for the uses of building: but, in a more limited sense, masonry is the art of assembling and joining stones together with mortar.

Hence arise as many different kinds of masonry, as there are different forms and manners for laying or joining stones. Vitruvius mentions several kinds of masonry used among the ancients: three of hewed stone, viz. that in form of a net, that in binding, and that called the *Greek masonry*; and three of unhewed stones, viz. that of an equal course, that of an unequal course, and that filled up in the middle; and the seventh was a composition of all the rest.

Net-masonry, called by Vitruvius *reticulatum*, from its resemblance to the meshes of a net, consists of stones squared in their courses, and so disposed as that their joints go obliquely; and their diagonals are the one perpendicular, and the other level. This is the most agreeable masonry to the eye, but it is very apt to crack. See n° 1.

Bound masonry, that in which the stones were placed one over another, like tiles; the joints of their beds being level, and the mounters perpendicular, so that the joint that mounts and separates two stones, always falls directly over the middle of the stone below. This is less beautiful than the net-work; but it is more solid and durable. See n° 2.

Greek masonry, according to Vitruvius, is that where after we have laid two stones, each of which makes a course, another is laid at the end, which makes two courses, and the same order is observed throughout the building; this may be called *double-binding*, in regard the binding is not only of stones of the same course with one another, but likewise of one course with another course. See n° 3.

Masonry by equal courses, called by the ancients *isodolum*, differs in nothing from the bound masonry, but only in this, that its stones are not hewn. See n° 4.

Masonry by unequal courses, called *pseudisodolum*, is also made of unhewed stones, and laid in bound work; but then they are not of the same thickness, nor is there any equality observed excepting in the several courses, the courses themselves being unequal to each other. See n° 5.

Masonry filled up in the middle, is likewise made unhewed stones, and by courses; but the stones are only set in order as to the courses. See n° 9. A, the courses; B, the parts filled up; C, a coat of plaster.

Compound masonry is of Vitruvius's proposing, so called as being formed of all the rest. In this the courses are of hewed stone; and the middle being left void, is filled up with mortar and pebbles thrown in together: after this the stones of one course are bound to those of another course with cramp-irons fastened with melted lead. See n° 7. E, the stones cramped; F, the cramps; G, the middle part filled up.—N° 8. represents another sort of compound masonry, the middle of which is stone, and the edges boards.

All the kinds of masonry now in use may be reduced to these five, viz. bound masonry; that of brick-work, where the bodies and projectures of the stones inclose square spaces or pannels, &c. set with bricks; that de moilon, or small work, where the courses are equal, well squared, and their edges or beds rusticated; that where the courses are unequal; and that filled up in the middle with little stones and mortar.

**MASS**, in mechanics, the matter of any body cohering with it, i. e. moving and gravitating along with it. In which sense, *mass* is distinguished from bulk, or volume, which is the expansion of a body in length, breadth, and thickness.

The mass of any body is rightly estimated by its weight. And the masses of two bodies of the same weight are in a reciprocal ratio of their bulks.

**MASS**, *Missæ*, in the church of Rome, the office or prayers used at the celebration of the eucharist; or in other words, consecrating the bread and wine into the body and blood of Christ, and offering them so transubstantiated as an expiatory sacrifice for the quick and the dead.

As the mass is in general believed to be a representation of the passion of our blessed Saviour, so every action of the priest, and every particular part of the service, is supposed to allude to the particular circumstances of his passion and death.

Nicod, after Baronius, observes that the word comes from the Hebrew *missach*, (*oblatum*;) or from the Latin *missa*, *missum*; because in the former times, the catechumens and excommunicated were sent out of the church, when the deacons said, *Ite, missa est*, after sermon and reading of the epistle and gospel; they not being allowed to assist at the consecration. Menage derives the word from *missio*, "dissolving;" Others from *missa*, "missing, sending;" because in the mass, the prayers of men on earth are sent up to heaven.

The general division of masses consists in high and low. The first is that sung by the choristers, and celebrated with the assistance of a deacon and sub-deacon: low masses are those in which the prayers are barely rehearsed without singing.

There are a great number of different or occasional masses in the Romish church, many of which have nothing peculiar but the name: such are the masses of the saints; that of St Mary of the snow, celebrated on the fifth of August; that of St Margaret, patroness of lying-in women; that of the feast of St John the Baptist, at which are said three masses; that of the Innocents, at which the *gloria in excelsis*, and the *hallelujah* are omitted, and it being a day of mourning, the altar is of a violet-colour. As to ordinary masses

maſſes, ſome are ſaid for the dead, and, as is ſuppoſed, contribute to fetch the foul out of purgatory : at theſe maſſes the altar is put in mourning, and the only decorations are a croſs in the middle of fix yellow wax lights; the drels of the celebrant, and the very maſs-book, are black; many parts of the office are omitted, and the people are diſmiſſed without the benediction. If the maſs be ſaid for a perſon diſtinguiſhed by his rank or virtues, it is followed with a funeral oration : they erect a *chapelle ardente*, that is a representation of the deceaſed with branches and tapers of yellow wax, either in the middle of the church or near the deceaſed's tomb, where the prieſt pronounces a ſolemn abſolution of the deceaſed. There are likewiſe private maſſes, ſaid for ſtole or ſtrayed goods or cattle, for health, for travellers, &c. which go under the name of *voſive maſſes*. There is ſtill a further diſtinction of maſſes denominated from the countries in which they were uſed; as the Gothic maſs, or *miſſa meſarabum*, is that uſed among the Goths when they were maſters of Spain, and which is ſtill kept up at Toledo and Salamanca; the Ambroſian maſs is that compoſed by St Ambroſe, and uſed only at Milan, of which city he was biſhop; the Gallic maſs, uſed by the ancient Gauls; and the Roman maſs, uſed by almoſt all the churches in the Romiſh communion.

*Maſs of the Preſanctified*, (*miſſa preſanctificatorum*,) is a maſs peculiar to the Greek church, in which there is no conſecration of the elements; but after ſinging ſome hymns, they receive the bread and wine which was before conſecrated. This maſs is performed all Lent, except on Saturdays, Sundays, and the annunciation. The prieſt counts upon his fingers the days of the enſuing week on which it is to be celebrated, and cuts off as many pieces of bread at the altar as he is to ſay maſſes; and after having conſecrated them, keeps them in wine, and then puts them in a box; out of which, upon every occaſion, he takes ſome of it with a ſpoon, and putting it on a diſh ſets it upon the altar.

MASSA, a town of Italy, in the kingdom of Naples, and in the Terra di Lavoro, with a biſhop's ſee; ſeated on a mountain near the ſea, in E. Long. 10. o. N. Lat. 43. 5.

MASSA, an ancient, populous, and handſome town of Italy, and capital of a ſmall territory of the ſame name, with the title of a principality, and a ſtrong caſtle. It is famous for its quarries of fine marble, and is ſituated in E. Long. 14. 23. N. Lat. 40. 40.

MASSACHUSETTS COLONY, the principal ſubdiviſion of New England, having Hampſhire on the north, the Atlantic ocean on the eaſt and ſouth, and Connecticut and New-York on the weſt. It is about 100 miles long and 40 broad. See *New-England*.

MASSALIANS, a ſet of entuſiaſts who ſprang up about the year 361, in the reign of the emperor Conſtantius, who maintained that men have two ſouls, a celeſtial and a diabolical, and that the latter is driven out by prayer.

MASSILIA, (anc. geog.), a town of Gallia Narbonenſis; a colony of Phœaciens, from Phœacia, a city of Ionia; and in confederacy with the Romans: univerſally celebrated not only for its port, commerce, and

ſtrength, but eſpecially for its politeneſs of manners and its learning. It was the ſchool for barbarians, who were excited by its means to ſuch a fondneſs for Greek literature, that even their public and private tranſactions were all executed in that language, according to Strabo; who adds, "At this day the nobleſt Romans repair thither for ſtudy, rather than to Athens." See *Marſeilles*, a city and port-town of Provence. See MARSEILLES.

MASSIEU (William), a learned French writer, member of the academy of belles lettres, and of the French academy, was born at Caen in Normandy in 1665, and completed his ſtudies at Paris, when he entered amongſt the Jeſuits; but afterwards left them, that he might follow his inclination to polite literature with the greater freedom. In 1710 he was made Greek profeſſor in the royal college; and enjoyed that poſt till his death, which happened at Paris in 1722. He wrote, 1. Several curious diſſertations in the memoirs of the academy of inſcriptions. 2. A hiſtory of the French poetry, in 12mo, &c.

MASSINGER (Philip), an English dramatic poet, was born at Salisbury about the year 1581, and was educated at Oxford. He left the univerſity without taking any degree; and went to London to improve his poetical genius by polite converſation. There he wrote many tragedies and comedies, which were received with vaſt applauſe; and were greatly admired for the œconomy of the plots, and the purity of the ſtyle. He was at the ſame time a perſon of the moſt conſummate modeſty; which rendered him extremely beloved by the poets of his time, particularly by Fletcher, Middleton, Rowley, Field, and Decker, who thought it an honour to write in conjunction with him. He was as remarkable for his abilities as his modeſty. He died ſuddenly at his houſe on the Bank ſide in Southwark, near the play-houſe; and was interred in St Saviour's church-yard, in the ſame grave with Mr Fletcher the poet.

MASSETER, in anatomy. See there, (*Table of the Muſcles*).

MASSIVE, among builders, an epithet given to whatever is too heavy and ſolid: thus a maſſive column is one too ſhort and thick for the order whole capital it bears; and a maſſive wall is one whole openings or lights are too ſmall in proportion.

MASSORA, in matters of literature, a critical work, containing remarks on the verſes, words, letters, and vowel-points of the Hebrew text of the Bible; a work more laborious than uſeful.

MAST, a long round piece of timber, elevated perpendicularly upon the keel of a ſhip, to which are attached the yards, the fails, and the rigging. A maſt, with regard to its length, is either formed of one ſingle piece, which is called a *pole-maſt*, or compoſed of ſeveral pieces joined together, each of which retains the name of maſt ſeparately. The loweſt of theſe is accordingly named the *lower maſt*, *a*, fig. 2. the next in height is the top-maſt, *b*, which is erected at the head of the former; and the higheſt is the top-gallant maſt, *c*, which is prolonged from the upper end of the top-maſt. Thus the two laſt are no other than a continuation of the firſt upwards.

The lower-maſt is fixed in the ſhip by an apparatus, de-

described in the articles *HULK* and *SHEERS*: the foot, or heel of it, rests in a block of timber called the *step*, which is fixed upon the *keelson*; and the top-mast is attached to the head of it by the *cap* and the *treffle-trees*. The latter of these are two strong bars of timber, supported by two prominences, which are as shoulders on the opposite sides of the mast, a little under its upper end: athwart these bars are fixed the *cross-trees*, upon which the frame of the top is supported. Between the lower mast-head and the foremoft of the cross-trees, a square space remains vacant, the sides of which are bounded by the two treffle-trees. Perpendicularly above this is the foremoft hole in the cap, whose after-hole is solidly fixed on the head of the lower-mast. The top mast is erected by a tackle, whose effort is communicated from the head of the lower mast to the foot of the top-mast; and the upper end of the latter is accordingly guided into and conveyed up through the holes between the treffle-trees and the cap, as above-mentioned. The machinery by which it is elevated, or, according to the sea phrase, *swayed up*, is fixed in the following manner: the top rope *d*, fig. 3. passing through a block *e*, which is hooked on one side of the cap, and afterwards through a hole, furnished with a sheave or pulley *f*, on the lower end of the top-mast, is again brought upwards on the other side of the mast, where it is at length fastened to an eye-bolt in the cap *g*, which is always on the side opposite to the top-block *e*. To the lower end of the top-rope is fixed the top-tackle *h*, the effort of which being transmitted to the top-rope *d*, and thence to the heel of the top mast *f*, necessarily lifts the latter upwards, parallel to the lower mast. When the top-mast is raised to its proper height, fig. 4. the lower end of it becomes firmly wedged in the square hole, above-described, between the treffle-trees. A bar of wood, or iron, called the *fid*, is then thrust through a hole *i* in the heel of it, across the treffle trees, by which the whole weight of the top-mast is supported.

In the same manner as the top-mast is retained at the head of the lower-mast, the top-gallant-mast is erected, and fixed at the head of the top-mast.

Besides the parts already-mentioned in the construction of masts, with respect to their length, the lower-masts of the largest ships are composed of several pieces united into one body. As these are generally the most substantial parts of various trees, a mast, formed by this assemblage, is justly esteemed much stronger than one consisting of any single trunk, whose internal solidity may be very uncertain. The several pieces are formed and joined together, as represented in the section of a lower mast of this sort, fig. 5. where *a* is the shaft, or principal piece into which the rest are fixed, with their sides or faces close to each other. The whole is secured by several strong hoops of iron, driven on the outside of the mast, where they remain at proper distances.

The principal articles to be considered in equipping a ship with masts are, 1st, the number; 2d, their situation in the vessel; and 3d, their height above the water.

The masts being used to extend the sails by means of their yards, it is evident, that if their number were multiplied beyond what is necessary, the yards must be extremely short, that they may not entangle each

other in working the ship, and by consequence their sails will be very narrow, and receive a small portion of wind. If, on the contrary, there is not a sufficient number of masts in the vessel, the yards will be too large and heavy, so as not to be managed without difficulty. There is a mean between these extremes, which experience and the general practice of the sea have determined; by which it appears, that in large ships every advantage of sailing is retained by three masts and a bowsprit.

The most advantageous position of the masts is undoubtedly that from whence there results an equilibrium between the resistance of the water on the body of the ship on one part, and of the direction of their effort on the other. By every other position this equilibrium is destroyed, and the greatest effort of the masts will operate to turn the ship horizontally about its direction; a circumstance which retards her velocity. It is counterbalanced indeed by the helm; but the same inconvenience still continues; for the force of the wind, having the resistance of the helm to overcome, is not entirely employed to push the vessel forward. The axis of the resistance of the water should then be previously determined, to discover the place of the *main-mast*, in order to suspend the efforts of the water equally, and place the other masts so as that their particular direction will coincide with that of the main mast. The whole of this would be capable of a solution if the figure of the vessel were regular, because the point, about which the resistance of the water would be in equilibrium, might be discovered by calculation.

But when the real figure of the ship is considered, these flattering ideas will instantly vanish. This observation induced M. Saverien to employ a mechanical method to discover the axis of resistance of the water, which he apprehended might be used with success in the manner following:

When the vessel is lanchd, before the places of the masts are determined, extend a rope A B, fig. 6. from the head to the stern. To the extremities A and B attach two other ropes, AD, BC, and apply to the other ends of these ropes two mechanical powers, to draw the ship according to the direction BC, parallel to itself. The whole being thus disposed, let a moveable tube Z, fixed upon the rope A B, have another rope ZR attached to it, whose other end communicates with a mechanical power R, equal to the two powers D and C. This last being applied to the same vessel, in such manner as to take off the effects of the two others by sliding upon the rope A B, so as to discover some point Z, by the parallelism of the ropes AD BC feebly extended with the rope ZR; the line ZR will be the axis of the equilibrium of the water's resistance, and by consequence the main-mast should be planted in the point Z.

The figures E, E, E, are three windlasses on the shore, by which this experiment is applied.

With regard to the situation of the other masts, it is necessary, in the same manner, to discover two points; so that the direction of the two mechanical powers operating, will be parallel to the axis of resistance RZ already found.

The exact height of the masts, in proportion to the form and size of the ship, remains yet a problem to be determined. The more the masts are elevated above the

the centre of gravity, the greater will be the surface of sail which they are enabled to present to the wind; so far an additional height seems to have been advantageous. But this advantage is diminished by the circular movement of the mast, which operates to make the vessel lurch to its effort; and this inclination is increased in proportion to the additional height of the mast, an inconvenience which it is necessary to guard against. Thus what is gained upon one hand is lost upon the other. To reconcile these differences, it is certain, that the height of the mast ought to be determined by the inclination of the vessel, and that the point of her greatest inclination should be the term of this height above the centre of gravity. See the article TRIM.

With regard to the general practice of determining the height of the masts, according to the different rates of the ships in the royal navy, the reader is referred to the article SAIL.

In order to secure the masts, and counterbalance the strain they receive from the effort of the sails impressed by the wind, and the agitation of the ship at sea, they are sustained by several strong ropes, extended from their upper ends to the outside of the vessel, called *shrouds*, as represented in fig. 4. They are further supported by other ropes, stretched from their heads towards the fore-part of the vessel.

The mast, which is placed at the middle of the ship's length, is called the *main-mast*; that which is placed in the forepart, the *fore-mast*; and that which is towards towards the stern, is termed the *mizen-mast*.

N. B. *Mizen* is applied to this mast by all the nations of Europe, except the French, who alone call the fore-mast *misaine*.

MASTER (MAGISTER), in general, is a title of authority, and applied to persons in various characters. It is also used as a compellation of respect.

MASTER of Arts, the first degree taken up in all foreign universities, but the second in those of England; candidates not being admitted to it in that country till they have studied in the university seven years.

MASTER of a Ship of War, an officer appointed by the commissioners of the navy to take charge of the navigating and conducting a ship from port to port, under the direction of the captain. The management and disposition of the sails, the working of the ship into her station in the order of battle, and the direction of her movements in the time of action and in the other circumstances of danger, are also more particularly under his inspection. It is likewise his duty to examine the provisions, and accordingly to admit none into the ship but such as are found, sweet, and wholesome. He is moreover charged with the *stowage*, or disposition of these materials in the ship's hold; and to enable him the better to perform these services, he is allowed several assistants, who are properly termed *mates* and *quartermasters*. See these articles.

MASTER of a Merchant-Ship, the commanding officer, who is appointed by the merchants to manage the navigation and every thing relating to her cargo, voyage, sailors, &c.

MASTER-Attendant, an officer in the royal dockyards, appointed to hasten and assist at the fitting out or dismantling, removing or securing vessels of

war, &c. at the port where he resides. He is particularly to observe that his majesty's ships are securely moored; and for this purpose he is expected frequently to review the *moorings*, which are sunk in the harbour, and observe that they are kept in proper repair to be always ready when occasion requires. It is also his duty to visit all the ships in *ordinary*, and see that they are frequently cleaned and kept in order; and to attend at the general musters in the dockyards, taking care that all the officers, artificers, and labourers, registered in the navy-books, are present at their duty.

MASTER at Arms, an officer appointed to teach the officers and crew of a ship of war the exercise of small arms; to confine and plant centinels over the prisoners, and superintend whatever relates to them during their confinement. He is also to observe, that the fire and lights be all extinguished as soon as the evening gun is fired, except those which are permitted by proper authority or under the inspection of centinels. It is also his duty to attend the *gangway* when any boats arrive aboard, and search them carefully, together with their rowers, that no spirituous liquors may be conveyed into the ship, unless by permission of the commanding-officer. In these several duties he is assisted with proper attendants, called his *corporals*; who also relieve the centinels, and one another, at certain periods.

MASTER of the Horse, a great officer of the crown, who orders all matters relating to the king's stables, races, breed of horses; and commands the equerries and all the other officers and tradesmen employed in the king's stables. His coaches, horses, and attendants, are the king's, and bear the king's arms and livery.

MASTER of the Revels, an officer who orders all things relating to the performance of plays, masks, balls, &c. at court.

MASTER of the Rolls, a patent-officer for life, who has the custody of the rolls of parliament and patents which pass the great seal, and of the records of chancery, as also commissions, deeds, recognizances; which, being made of rolls of parchment, gave rise to the name.

In absence of the chamberlain, he sits as judge in the court of chancery: at other times he hears causes in the rolls chapel, and makes orders; but all hearings before him are appealable to the chancellor.

MASTER of the Wardrobe, an officer under the lord-chamberlain, who has the care of the royal robes, as well as the wearing apparel, collar, george, and garter, &c. He has also the charge of all former kings and queens robes remaining in the tower, all hangings, bedding, &c. for the king's house, the charge and delivery of velvet and scarlet allowed for liveries. He has under him a clerk of the robes, wardrobe-keeper, a yeoman, &c.

MASTER and Servant; a relation founded in convenience, whereby a man is directed to call in the assistance of others, where his own skill and labour will not be sufficient to answer the cares incumbent upon him. For the several sorts of servants, and how that character is created or destroyed, see the article SERVANT. In the present article we shall consider, first,

25 I the

the effect of this relation with regard to the parties themselves; and secondly, its effects with regard to others.

Black.  
Comment.

1. The manner in which this relation affects either the master or servant. And, first, by hiring and service for a year, or apprenticeship under indentures, a person gains a settlement in that parish wherein he last served 40 days. In the next place, persons serving seven years as apprentices to any trade have an exclusive right to exercise that trade in any part of England. This law, with regard to the exclusive part of it, has by turns been looked upon as a hard law, or as a beneficial one, according to the prevailing humour of the times: which has occasioned a great variety of resolutions in the courts of law concerning it; and attempts have been frequently made for its repeal, tho' hitherto without success. At common law every man might use what trade he pleased; but this statute restrains that liberty to such as have served as apprentices: the adversaries to which provision say, that all restrictions (which tend to introduce monopolies) are pernicious to trade; the advocates for it allege, that unskilfulness in trades is equally detrimental to the public, as monopolies. This reason indeed only extends to such trades, in the exercise whereof skill is required: but another of their arguments goes much farther; viz. that apprenticeships are useful to the commonwealth, by employing of youth, and learning them to be early industrious; but that no one would be induced to undergo a seven years servitude, if others, tho' equally skilful, were allowed the same advantages without having undergone the same discipline: and in this there seems to be much reason. However, the resolutions of the courts have in general rather confined than extended the restriction. No trades are held to be within the statute, but such as were in being at the making of it: for trading in a country village, apprenticeships are not requisite, and following the trade seven years is sufficient without any binding; for the statute only says, the person must serve as an apprentice, and does not require an actual apprenticeship to have existed.

A master may by law correct his apprentice for negligence or other misbehaviour, so it be done with moderation: though, if the master or master's wife beats any other servant of full age, it is good cause of departure. But if any servant, workman, or labourer, assaults his master or dame, he shall suffer one year's imprisonment, and other open corporal punishment, not extending to life or limb.

By service all servants and labourers, except apprentices, become entitled to their wages: according to agreement, if menial servants; or according to the appointment of the sheriff or sessions, if labourers or servants in husbandry: for the statutes for regulation of wages extend to such servants only; it being impossible for any magistrate to be a judge of the employment of menial servants, or of course to assess their wages.

2. Let us now see how strangers may be affected by this relation of master and servant; or how a master may behave towards others on behalf of his servant, and what a servant may do on behalf of his master.

And, first, the master may maintain, that is, abet

and assist, his servant in any action at law against a stranger: whereas, in general, it is an offence against public justice to encourage suits and animosities, by helping to bear the expence of them, and is called in law *maintenance*. A master also may bring an action against any man for beating or maiming his servant: but in such case he must assign, as a special reason for so doing, his own damage by the loss of his service; and this loss must be proved upon the trial. A master likewise may justify an assault in defence of his servant, and a servant in defence of his master: the master, because he has an interest in his servant, not to be deprived of his service; the servant, because it is part of his duty, for which he receives his wages, to stand by and defend his master. Also if any person do hire or retain my servant, being in my service, for which the servant departeth from me and goeth to serve the other, I may have an action for damages against both the new master, and the servant, or either of them: but if the new master did not know that he is my servant, no action lies; unless he afterwards refuse to restore him upon information and demand. The reason and foundation upon which all this doctrine is built, seem to be the property that every man has in the service of his domestics; acquired by the contract of hiring, and purchased by giving them wages.
